3631 I may say right here, and in this connection we might as well be done with this once for all:—We used to think that running water, when it got thoroughly aerated purified itself, especially if it came from long distances. That was the theory on which Pittsburgh put in its water-works. That was the theory upon which Lowell took the obviously sewage polluted water of the Merrimac, and used it for water supply purposes. It was one of the commonest things that chemists and sanitarians believed, and they had reason to believe at that time, that running from—at even modern distances, water would so purify itself as to be safe; but Pittsburgh and Lowell and Lawrence, and so far as I know, nearly all—perhaps all—of the cities that have trusted to that, have been typhoid ridden, and today, as I reported at Pittsburgh, the distance of 100 miles or even more remote points, infection coming from Oil City, 113 miles or even more remote points may produce typhoid fever. It is not today so much of a question of distance; it is the question of giving time for the germs to settle out and to die out, and it is dilution and time of quiescence, particularly quiescence. It is simply a question of time. You have got to eliminate all idea of distance from these things and bring in the question of time largely, and that is what I have stated in my treatise on Sanitary Science and Public Health, written two or three years

ago. It is nothing that I have got up for this case or any-
3632 thing of that kind; it is a fact that is borne in upon me by long experience, and I believe that in that respect I stand entirely square with the sanitarians of the world. At any rate I hold that opinion myself.

Q. Professor, would the amount of infectious pollution affect the question of time needed, or the degree of danger?

A. It affects the degree of danger. It would not affect the time; that is the time for each individual microbe; of course that is its own individual problem. One microbe coming down from Chicago and resting quietly in the slack water of the Illinois, if it lay there long enough, would probably die out—I would say, must certainly die out if it lay there long enough. Of course, someone might not agree with me on that, but I think so; but of course if a million came down the chances that some might be carried on by a little freshet or something of that kind before they had died out,—for they don't all die at the same time—would be greatly enhanced, and other things being equal, the larger the infection the more serious the danger.

Q. Professor, do you know whether or not the flowing of the waters of the Niagara river over the falls tends to or does eliminate the disease bearing germs in that water?

A. I don't know how it is as a matter of fact, but the organic matter which was formerly supposed to be so oxidized by running in an open stream and which was the basis of
3633 self purification of streams, has been repeatedly analyzed by Professor Leeds and said to be exactly the same after it has gone down the falls, and been thoroughly aerated, as it was before; and I believe that allowing for the time, the germs would be just the same below as above. When I said Niagara Falls I mean the city of Niagara Falls, the town of Niagara Falls, where typhoid is rampant today, and it is rampant, as I believe because they are drinking the sewage of Buffalo, which has come bounding down that river and has been splendidly aerated and has had a chance to purify itself, but it has not purified itself because the time is short; and the reason that Buffalo gets along fairly well with typhoid is in my opinion because the germs put in at Detroit and Cleveland and all along up the lakes have partly sedimented out; partly died out in

Lake Erie en route, in the flowing water or at the bottom; and they have typhoid at Buffalo or will have it, Lake Erie being a shallow lake, because although Lake Erie distributes the pollution very much and gives a good chance for purification it is still shallow; and they are thoroughly scared today, and are talking seriously of going in for filtration, although they are so far away from Cleveland.

Q. Have you any reason as an expert, to believe that the aeration the bacilli might receive flowing down the Niagara River and proceeding over the falls, would cause their death?

A. No sir; on the contrary, I believe they would be more 3634 likely to survive if there was plenty of oxygen present.

Q. Now professor, considering your personal knowledge as an expert of typhoid fever conditions in the Sanitary District of Chicago and existing conditions in said district as to sewers and the out-falls thereof, and the amount of sewage, and all existing conditions of the Desplaines, the Illinois, Mississippi and Missouri rivers, and all conditions existing in the water-sheds of said streams, and the tributaries thereof and all existing conditions as to whether the water supply of the City of St. Louis and the general sanitary conditions existing in the city of St. Louis, would you or not, beyond a reasonable doubt, attribute the principal portion of the increase of typhoid fever in St. Louis since the opening of the drainage canal to the infected sewage of the Sanitary District of Chicago?

MR. TODD: I object to that question on the ground that it does not contain all the conditions pertaining to the typhoid fever along the water-sheds of the Missouri, Mississippi and Illinois Rivers and their tributaries.

Q. (Question read).

MR. TODD: I want to add to my objection that while it contains existing conditions, it does not include the sanitary conditions as regards typhoid.

MR. DRENNAN: Now I want to make an objection. I object as the testimony of the witness does not disclose that he is familiar with the sanitary conditions of all the cities 3635 and villages above St. Louis on these rivers and their tributaries, and the question does not embrace the fact as to such conditions.

GENERAL CROW: Well, I will qualify him on that.

Q. You have a general knowledge of the existing conditions of the water sheds of these rivers I have mentioned?

MR. TODD: I object to that question on the ground that it is leading.

DR. DRENNAN: My objection was in regard to sanitary conditions, General Crow.

GENERAL CROW: Well if he has knowledge of the general conditions he knows the sanitary conditions.

Q. Well, put it that way, so as to meet the fastidious taste of you gentlemen. Have you a general knowledge from reading and literature, of the general sanitary conditions existing on the water-sheds of these rivers?

A. I think I may say that I have a general knowledge as to the sanitary conditions in regard to typhoid fever. I don't know that I have much knowledge in regard to consumption and a lot of other things.

Q. That is what we are talking about—typhoid fever?

A. That is what I meant—typhoid fever. Well, I should state that I have a general knowledge of the sanitary conditions.

3636 GENERAL CROW: Now read that previous question. (Previous question read).

A. After a careful consideration of the subject I can say that in my opinion beyond a reasonable doubt, the principal portion of the increase of typhoid fever in St. Louis, since January 1st, 1900, of the principal annual increase, since January 1st, 1900, has been due to the pollution of the water supply of St. Louis by the sewage of the Sanitary District of Chicago.

Q. I will ask you to state, professor, if you did not say this morning in answer to one of my questions that from 1895 to 1899 the typhoid rate was substantially normal in the city of St. Louis, comparing favorably with similar cities, of like situations, and of similar size, as to the typhoid rate only?

A. From 1895 to 1899 both inclusive, during those five years, yes; that was what I did say.

JUDGE JOHNS: 1895 to 1899 is five years.

A. Yes, it is five years.

GENERAL CROW: And your answer is what?

A. My answer is that I did say substantially that—just read that question again.

(Question and answer read).

A. (Continuing) Although I should like to add that 3637 the word "normal" here must be taken in a general, rather than an advanced sanitary sense, for I believe that both Boston and St. Louis are capable of further improvement in this direction and both are higher than New York and London.

Q. I will ask you to state if you know, Professor, how the typhoid rate compares in St. Louis City from 1895 to 1899 inclusive, with the rate from typhoid fever in Lowell after the introduction of the ground filter water supply, and in Lawrence after the introduction of the first class filtration plant?

A. In 1895 to 1899 it compared favorably with the typhoid death rate of those cities.

Q. Is there any appreciable substantial difference?

A. I should think not. I don't remember off hand, just what they were.

Q. Have you any experience, Professor, in investigating typhoid fever epidemics caused by seriously infected water in running streams that would cause you to believe any running stream can absolutely be relied upon at all times to remove disease bearing germs such as the typhoid bacillus?

A. No sir, not if the pollution was at all serious or extensive.

Q. Professor, do you or not consider that the Illinois River water containing the mixed sewage and canal water 3638 from the Chicago Drainage District since the opening of the drainage canal has rendered less safe and wholesome now than before the opening of the canal, for drinking purposes on the part of the inhabitants of Missouri, the water of the Mississippi river below the mouth of the Illinois river?

A. Now will you kindly read that again?

Q. (Question read).

A. This question opens up a number of subsidiary questions, and I shall, be unable to answer it without some little consideration of these questions.

As I understand it, the question really is whether the mixing of the sewage of the Chicago river in the Chicago river, with lake water, and the pouring of that mixture down the Illinois does or does not enhance the danger of infection on the part of the people of the Missouri shore?

Q. That is the interpretation that I meant you should put on the question.

A. Yes. Now in the first place we have got to consider the matter of dilution. The addition of an amount of lake water which will yield 5,000 cubic feet a second at Lockport, passing out of the canal does, on the face of it, add to the sewage a water purer than that sewage. The sewage is therefore to some extent diluted, unquestionably diluted, and that is shown by the improved condition of the Chicago river. Anybody
3639 who is familiar with the old conditions can see that the Chicago River is cleaner and fresher than it was before. At the same time it must be borne in mind that the water which is thus used for purposes of dilution is not itself the unpolluted water of Lake Michigan. It is drawn chiefly from the mouth of the Chicago river and vicinity, and the Lake Michigan water in that vicinity and at that mouth has long been known to be infected, more or less. The problem then resolves itself into this, in part: Does the dilution of a presumably, of an often infected sewage, by a presumably often infected water, contribute to the purity of the Illinois river? But that is not all. The Chicago River was formerly a sluggish stream. Today it is much less so, and those infectious materials that were formerly put into the Chicago river are today carried with comparative swiftness down the drainage canal and into the Desplaines and Illinois rivers. We have further, then, to consider whether sewage, as described above, carried quickly, and in considerable volume, into the Illinois river, does or does not render that river safer than before. My own belief based upon those considerations which I have already outlined in regard to time as a purifying factor is that it is at least very doubtful whether the pouring of the sewage of Chicago, diluted as described, into the Illinois river does at any time improve that river. Looking at it still more closely and considering the larger amount of sewage now delivered, the opportun-
3640 ities for sedimentation; the susceptibility of the Illinois

river to freshets, large and small, and in view of the changed conditions brought about by the introduction of this fresher sewage with a larger volume of water, I am inclined to believe that,—and further, in view of the frequent extensive pollution of the sewage of Chicago by the germs of typhoid fever,—

Q. You mean infection, don't you?

A. Infection of typhoid fever, I should say—I am inclined to believe that the pouring of the sewage diluted as described, into the Illinois river, has not at any time improved it from a sanitary point of view—from the point of view of the health of the people who may use that water on the Missouri shore. I may say that undoubtedly at times it may have improved its appearance, and may seem to have improved its quality; but taking it through the year at all times, at all seasons, I am inclined to doubt exceedingly such improvement,—any such improvement at any time.

Q. Would any amount of dilution eliminate infectious pollution completely?

A. No sir, mere dilution does not eliminate infection; does not destroy it. Dilution may eliminate it from one particle of water by pushing it into another particle, but it does not eliminate it from the stream.

3641 Q. Now professor, I will get you to state whether or not in your opinion the liability to contract typhoid fever or other water-borne diseases on the part of the inhabitants of Missouri, using the Mississippi river water for drinking purposes below the mouth of the Illinois river, by reason of the sewage from the Drainage Canal, infecting the water of the Illinois river, is constant, immediate and continuous under all existing conditions, upon the Mississippi, the Desplaines, the Illinois and the Missouri river, and the tributaries of said streams and all existing conditions upon the water-sheds of said rivers and the tributaries thereof, and the drainage canal of the Sanitary District of Chicago?

A. I believe that the danger is practically constant,—by which I mean that it can never be known at what moment infectious material may arrive from the sewers of Chicago. I do not suppose that such material is arriving every minute, or

every hour, but I believe that the danger is constant, because
we never can know when it may come. I believe that it is immediate,—in
the sense that it is urgent and serious; and I believe
that it is impending, from the fact that it is, as it were,
hanging over the citizens of Missouri on the shores of the Mississippi
all the time. I can't help looking at the thing in this
way:—It is as if there were now located on the water-shed
of the Mississippi, since the opening of the drainage
3642 canal, a big additional city, a city notorious for its typhoid
death rate, or for its typhoid epidemics, I would
say, and,—yes, for its high death rate too, from typhoid fever;
and as if the placing of that city virtually upon the Mississippi
water-shed had introduced a new element into the life and welfare
of the people on the river below. It is no trifling matter to
take on a city of that size and add its sewage to an already
sewage-polluted stream. The danger line may by that addition
be reached sooner—must in the nature of things be reached
sooner, by those who use the water, and it is for that reason
that I do regard the danger as impending, immediate and aggravated,
as well as continuous.

Q. Professor, has it been your observation that in cases where typhoid-infected sewage was delivered into streams containing dams and ponds, that such dams and ponds have proved efficacious at all times in preventing the infection from reaching communities using the stream as a source of water supply below?

A. No sir, the truth appears to be this. Again, it is a
question of sedimentation and time. Dams undoubtedly so far
as they produce slack water or quiescence, favor purification and
the disappearance of disease germs for the time being, but if
the sediment or sludge is allowed to remain in the stream and
not removed artificially, or taken out and put off out of
3643 a position of danger, the chances are good, and experience
shows, that in freshets it may be returned to the
stream, again become a part of it, travel with it and produce
trouble below. That was the case for example, at Newburyport,
below the sewers of Lowell and the Lawrence dam, and that dam
at that time, as I remember it,—I am not perfectly sure about
this,—was allowing no water to go over it; it may have been

a slight stream, but it was in August, and at that season of the year the water very seldom goes over the dam. Part of it goes through the mills. The Merrimac is often a series of mill ponds, a series of quiet lakes in which sedimentation goes on nicely and the water shows great purification at such times, but just as soon as a thunder shower or anything comes, sufficient to upset the stream, it begins to rise and scouring takes place and trouble may ensue, as happened in the case of Newburyport,—although in that case I do not remember whether there was any such shower; but it is a general principle that dams are useful; they are helps, but they are not sufficient to rely upon for purification; they alone are not sufficient, and the only way in which they could be made efficient would be to have them made high enough to hold the water back and then carefully clean out the stuff and get rid of it, but even that would not do in case of water supplies because of the very act of stirring up things, —and you may get something from this as you did in the case of Detroit in the epidemic which occurred there. The only safeguard is to keep the germs quiet in the sediment
3644 at the bottom so long that they shall have entirely died out. We hardly ever know when that is. It is a very weak reed to lean upon.

Q. At Lawrence there is a big waterpower, supplying immense amounts of machinery with power to run, is there not?

A. Yes sir.

Q. How far backwards toward Lowell and up the stream does the dam affect and slack the water?

A. At times the water reaches back almost to the Lowell sewers.

Q. And how far would that be?

A. It would be nearly nine miles, and in the dam above Lowell, which furnishes the power to Lowell—it reaches back almost to the town of Nashua, New Hampshire, sixteen miles. The Merrimac river in the summer, is a series of mill-ponds, slack water like that, the water used for mill power. I am very sure that the Lowell mill-pond in summer is about sixteen miles long. I remember very well the lesson I had there. I thought that that would be a time when the water would be of the worst quality. That was twelve or thirteen or fourteen years ago.

We didn't know as much about it as we do today,—we don't know as much about it today as we wish we did,—and I expected to get a very bad water from those ponds which received
3645 so much sewage from above. On the contrary I found it very good, but in Lowell and in Lawrence we have always got our epidemics,—or have generally got our epidemics,—in the time of freshets, when the freshets come down the river and scour it out. That is the time when we get into trouble. We do not have a high typhoid rate in summer when the dams are effective and sedimentation is going on, we get it in the spring when the pollution is great and the scouring is also great.

Q. You speak now as to the time when you usually got your epidemics—

A. Let me add,—And also in the autumn, or after the autumn rains.

Q. Well, you speak now of the time when you generally get your epidemics following a rise of the river, and you refer do you not to the period anterior to the date of securing better water supply for both Lowell and Lawrence?

A. Oh, certainly. Lowell and Lawrence stand now, almost with the best rank in the world,—a very high rank at any rate,—since they had this terrible lesson of the epidemics of 1890 and 1891. Lawrence immediately set to work and put in an intermittent sand filter, and Lowell went to work and put in driven wells. Both are now among the cities having entirely reasonable death rates from typhoid fever.

3646 Q. Professor, I will get you to state what in your opinion as a general proposition will be the future increase in the population of the Sanitary District of Chicago, as compared with the remainder of the water-sheds of the Desplaines, Illinois, Mississippi and Missouri rivers, and their tributaries?

JUDGE JOHNS: That is objected to as not a question that can be propounded to a sanitary expert, as there is no qualification shown here for an opinion on the increase of population in a certain territory.

GENERAL CROW: Go ahead and answer the question.

A. My opinion is that the rate of growth in the Chicago Sanitary District is likely much to exceed, and the total growth is likely greatly to surpass, that upon the other places mentioned. I should expect it to be at least ten times as great. I will add to this answer,—basing an opinion upon pages 119 and 121 of the "Illinois State Board of Health report for 1901, sanitary investigation of the Illinois River and tributaries,"—I should even be willing to make this figure very much larger, as the increase in rural population given there is less than one per cent; that in urban popuation outside the sanitary district of Chicago is 28.2 per cent, and that of the City of Chicago is 54.4 per cent:

Q. Speaking generally, professor, how does the urban population increase in this country as compared to the rural
3647 population?

A. It is increasing very much faster. I will add a little to that if you please. It is increasing very much faster I said. Now it is one of the most striking facts with which sanitarians have to deal, that villages are growing into towns; towns into cities; water supplies and sewerage systems are being introduced and in consequence of this growth, problems of water supply and sewage disposal are almost everywhere becoming common and pressing. This condition of things is bound to increase. In the older cities it has already led to serious investigation and litigation, with long and varied attempts at remedial legislation, and I cannot help feeling that with the impending growth of cities and towns in the Mississippi valley, it is a question of the gravest sanitary consequence what becomes of the sewage of the cities and towns in that valley,—in or near that valley,—and also how their water courses may be kept from pollution and the dangers of infection.

Q. Now Professor assuming that Chicago sewage now ordinarily reaches St. Louis intake tower at the chain of rocks in a period varying from about one to three weeks, and averaging about two weeks, and further assuming that Chicago increased in population to 5,000,000 people, and dilutes its sewage in the drainage canal in the same proportion as at present, what significance will those future conditions of Chi-
3648 cago bear to the sanitary character of the water flowing in the Mississippi river along the Missouri shore, and especially at the chain of rocks intake tower?

A. Let me have that question again?

Q. (Question read).

JUDGE SPRINGER: On behalf of the sanitary district, I object to this question on the ground that its answer will not be responsive to any of the issues in this case. We are not trying a case that may happen when Chicago has 5,000,000 inhabitants. It may never occur in the world.

MR. TODD: I want to make an objection that the facts assumed in that question as to the rate, has not been established by the evidence, as to average or minimum or maximum.

GENERAL CROW: I didn't put any time on that question.

MR. TODD: You said one week to three weeks, with an average of two.

A. That seems to me one of the most interesting, and one of the most serious features in this whole case, as I understand it. Any material growth in the population of Chicago, accompanied by a corresponding dilution of its sewage to that which it now has, must obviously quicken the stream flowing in the Illinois, and have an effect in bringing infectious materials more rapidly and more quickly to the people of Missouri.
3649 I cannot help looking at it in this way. It is as if Chicago should be gradually moved towards St. Louis, as if the distance between the two cities should be diminished, and as if potentially Chicago should become a nearer neighbor, from a sanitary point of view, of St. Louis and the vicinity. The larger Chicago gets of course the nearer it practically comes. Now as I have repeatedly said, one of the great elements in this matter of sewage purification is time, and anything that would hasten the delivery of infectious materials at the chain of rocks, other things being equal, would add very seriously in my judgment to the dangers pertaining to an infected drinking water in St. Louis. I should go even further. I should say that it was of interest not only to St. Louis and Missouri, but to Illinois herself, and to the cities and towns that are bound to grow up in the valley below, and that if Asiatic cholera or any other infectious disease the germs of which are carried by water, should appear in a city five times as big as the present, or having a population of 5,000,000, it would be a very much magnified menace to the welfare of the inhabitants

of the Mississippi valley. I should say this even if Chicago should purify her water supply and reduce her typhoid fever, because epidemics sometimes come even upon communities having a good water supply, and the mere existence of this 3650 large number of human beings pouring their sewage down the Mississippi valley, no matter how good their general sanitary condition might be, would be a very serious item in the welfare of the inhabitants in the future; that under existing conditions, with typhoid fever abundant, and excessive, in amount in Chicago, any material increase of population; any added flow of sewage which would give us a shorter time in the slack water portions of the river, in my opinion would be a very important and very serious menace to the people of the Mississippi valley.

MR. TODD: Read the first part of that answer.

(First portion of answer read, as follows): That seems to me one of the most interesting and one of the most serious features in this whole case as I understand it.—

MR. TODD: I move to strike that sentence out as not responsive.

THE WITNESS: Just read that answer.

(Answer read).

THE WITNESS: The mere presence of pollution— I mean by that uninfected sewage. That is supposing Chicago had reduced her typhoid rate, she would still pour her sewage down the valley, and that sewage by merely favoring the longevity or growth of germs which got in from Peoria or anywhere else, would be an added menace to cities with water supplies, even if she did not send typhoid fever germs down; sending the filth alone down, is serious.

3651 MR. TODD: I would suggest that that last clause be subjoined to his answer and my objection follow that, —because now it comes right in the middle of that answer. I moved to strike out the first part of his answer.

Q. Professor, I will ask you this question: Do you or not consider that the Illinois river water polluted and infected by the sewage from the Chicago Sanitary District, since the opening of the drainage canal, has rendered less safe the water supply of the city of St. Louis as drawn at the intake tower at the chain of rocks, and on what do you base your opinion?

MR. TODD: I object to the question on the ground that it has been asked before and answered.

GENERAL CROW: No, the other question was generally as to the waters below.

Q. (Question repeated).

A. I do consider it less safe for the reason that I believe that the germs of typhoid fever may and do find their way through the intake at the chain of rocks, into the water supply of the city of St. Louis.

Q. Professor, assuming that the population of the Chicago Sanitary District covers about 3,000,000 people and that the flow through the drainage canal reaches 600,000 cubic feet a minute, what in your opinion would be the effect on the water of the Illinois river as compared with that water at its
3652 mouth as found during the past three years?

A. I believe that it would be less pure and less wholesome.

Q. What would you say as to the relative amount of infectious material and pollution in the river under those changed conditions?

A. I should expect under those conditions,—doubling the flow through the Drainage Canal,—with the conditions which I have already referred to at length above, would prevail to a greater or less extent, and that the danger of infection would be enhanced or increased. The danger of infection would be increased.

Q. Now Professor, assuming that the population of the Chicago Sanitary District is increased to 5,000,000 of people and that the flow through the drainage canal reaches 1,000,000 cubic feet per minute, what in your opinion would be the effect on the water of the Illinois river at its mouth as compared with the water at that point as found during the past three years?

A. I believe that the water would be less pure, less wholesome and more infectious and less suitable for drinking purposes for the reasons already given.

Q. Now professor, what do you say as to the general proposition regarding the mixing of the Illinois and upper Missis-

sippi river water, during their flow from Grafton to the
3653 chain of rocks intake tower of the St. Louis waterworks?

A. I believe that a mixture takes place at times, such that the water of the Illinois river may find its way to the intake of the St. Louis waterworks at the chain of rocks.

Q. Now professor, I will ask you this question: Assuming that the Chicago sewage from 1,500,000 people living in the Sanitary District and City of Chicago, should be discharged into the Chicago drainage canal and carried through the canal into the Des Plaines river and thence into the Illinois river, Chicago being situated 358 miles from the St. Louis intake, and assuming that a typhoid fever epidemic of extraordinary proportions should become prevalent among the residents of the sanitary district of Chicago, at a time when the sewage from said district is being so discharged into the canal, what immediate and impending danger would exist, and what effect would it have on the people of St. Louis and those people living on the Missouri side of the Mississippi river below Grafton who used the waters of the Mississippi river for drinking purposes?

A. I believe that an epidemic of the kind described under the circumstances mentioned, would under existing conditions be likely to produce an epidemic of large proportions among those so using the water.

3654 Q. Well, would it cause any immediate danger?

A. As to the immediate danger, I think perhaps I have already dwelt upon that sufficiently, but there can be no question that if such an epidemic should appear, the citizens of St. Louis and the Missouri shores, would have a right to regard themselves as in a critically dangerous condition, as far as their water supplies were concerned.

Q. Now, professor, assuming the same conditions as in the last question you have been answering, and assume that instead of an extraordinary typhoid fever epidemic prevailing in the Sanitary District of Chicago a cholera epidemic should prevail in the sanitary district of Chicago, a severe cholera epidemic should prevail in the Sanitary District, would the danger be imminent, impending and immediate to the people of Missouri below Grafton who use the waters of the Mississippi for drinking purposes, as far down as the chain of rocks?

A. I think that it would, sir, for the simple reason that they could never be sure, under existing conditions, that some of the germs of that disease might not find their way into their water supplies from the sewage of Chicago.

Q. Now, Professor, looking forward into the future and
considering not this general relation alone, but those that are
to follow and considering the relation of the filth and infection
of the sewage of the Chicago Sanitary District to the
3655 water of the Mississippi river as it flows along the Mis-
souri shore; considering the effect in hastening the filth
and sewage from the cities on the Illinois river below the mouth
of the drainage canal, and assuming that dilution is maintained
in the same proportions as that which now exists caused by the
added volume of water from the canal into the Illinois river,
I will ask you to state your views as an expert on public health
matters regarding the above mentioned conditions, considered
as a broad, practical proposition?

A. I have already perhaps covered part of the ground
which would be a proper answer to this question, but there are
some other considerations that I think ought to be taken into
account and some of them are these: We are finding it in-
creasingly difficult to get unpolluted water for drinking pur-
poses. Our fathers did not feel it necessary to filter or to store
or to treat the waters as we often find it necessary to do today.
Our children will, if foresight is worth anything, be obliged to
filter as we have to do today and a great deal more perfectly.
With the increased use of water and the increased development
of populations and industries, the production of by products and
trades wastes and agricultural drainage and all sorts of things
upon the watersheds, pure water will become very scarce, and
cities and towns will probably be driven first to filter their water
as they are now doing in some places, and in the second
3656 place very likely, to filter it twice. Then will come a time
when the rivers will get so sewage polluted that mere fil-
tration will not suffice. It may be that at that time, all the
cities will unite in declining to put sewage into the water courses,
but whether they do or not, it will be increasingly difficult to
secure good water and to get rid of the sewage. Now I hold that
we have no business to hasten the arrival of these days of

trouble. We have, perhaps, troubles enough of our own, but at the same time we ought to use every endeavor and I believe it is the opinion of sanitarians in general that cities ought to use every endeavor, first, to preserve the purity of their own water supply; secondly, preserve the purity of the water supplies of their neighbors. In England many of the water courses are so small that cities and towns are obliged to treat their sewage, and if the population of cities like Chicago and St. Louis goes on growing, I look forward to the time when we shall be in straits,—and that time is perhaps not so very far distant for some cities,—when we shall be in straits for decent water; when it will be possible for us to secure a good water supply only at great expense and difficulty. The cities of the Mississippi valley are using and must use very largely the water courses in that valley. Some of them are suffering already from polluted water supplies. They will be obliged
3657 very soon to spend large sums in purifying their water.

Every ton of filth or refuse; every infectious disease germ added to their streams increases that difficulty and means expense and outlay for those cities. I think the question of what will happen if Chicago grows very much larger and continues to pour its refuse and disease germs upon the Mississippi valley, is not an academic question; it is a practical, burning question, and it is going to become more so as time goes on.

MR. TODD: I move to strike out the answer as not responsive to the question and contains matter that is not relative to the inquiry made, and the pleadings of this case.

MR. DRENNAN: I object to the question and move to strike out the answer on the ground that the question and answer are too remote and indefinite.

GENERAL CROW: Now Professor, I will get you to state if you have any knowledge on the subject from which you can give an opinion as to whether or not the stream flow in this country will increase?

A. I have only a very general knowledge, but a very definite impression, and that is, following the results of experience, —that we may expect that stream flows in general will not increase, but rather decrease as time goes on.

Q. Has that been the experience in other countries?

3658 A. That has been the experience more particularly in the older portions of this country.

Q. What particular sections of the country do you refer to?

A. I am thinking most particularly of the water-shed of the Connecticut at this moment.

Q. Have you made any observations?

A. No sir, no study of it.

Q. Have you any knowledge that would enable you to state an opinion as to whether or not the dry weather flow of the streams in this country is diminishing?

A. No sir I have not. I haven't done very much in that line.

WILLIAM T. SEDGWICK,

ADJOURNED until 10:00 A. M., Wednesday, May 20th, 1903.

3659 Southern Hotel, St. Louis Missouri. 10:00 A. M., Wednesday, May 20, 1903. Parties met pursuant to adjournment.

Present, the Commissioner and the same counsel representing the respective parties.

WILLIAM THOMPSON SEDGWICK,

resumed the stand for further direct-examination by Attorney General Crow, and testified as follows:—

GENERAL CROW: Now we have some typhoid fever statistics here that we want to offer. I suppose you gentlemen will not require us to read them into the record. We can present them to you and you can inspect them.

MR. JEFFRIES: Complainant offers in evidence certicate of the City Clerk and ex-officio Secretary of the Board of Health of the City of St. Charles, showing the number of deaths from typhoid fever in St. Charles, Missouri, from July 1st, 1899 to January 1st, 1903.

GENERAL HAMLIN: Mr. Jeffries, have you a copy of them?

MR. JEFFRIES: No sir, I have not.

GENERAL HAMLIN: We can have a copy made, can't we?

MR. JEFFRIES: Certainly.

GENERAL CROW: Just make the offer and let them 3660 have the right to object to any part of it, or all of it.

GENERAL HAMLIN: Of course, strictly speaking, you could not offer them now, but you can let them be offered without any objection as to the time when they are offered, but subject to any objection that we might make in regard to the substance matter or the correctness of them.

GENERAL CROW: That is all right, and we will have copies of them made and furnished to you.

GENERAL HAMLIN: I think General, they ought to go into the record at the close of this man's testimony.

GENERAL CROW: Well, we want to insert them in the record at this place when the record is finally written up, but if we put some of them in the record now, and have to change some of them, why we will have to change the record, and by furnishing the original to the stenographer, he don't have to write it in until he gets it.

MR. JEFFRIES: We offer in evidence, certificate of the Clerk of the District, Court, and the custodian of the mortuary records of the city of Davenport, Iowa, showing the typhoid deaths in that city by months from 1893 to 1902, inclusive;

Also certificate of the clerk of the county Court, and custodian of the mortuary records in the County of Rock Island showing the number of typhoid deaths in the city of Rock Island, Illinois by months for the years 1893 to 1902, inclusive.

3661 And including the months of January and February, 1903.

Also certificate-certified copy—of the City Clerk of the City of Moline, in the State of Illinois, and the custodian of mortuary records of that city, showing typhoid deaths by years for the years 1893 to May 16th, 1903, inclusive.

Also a statement and certificate of the clerk of the County Court of Jo Davies County, Illinois, showing the number of deaths from typhoid fever in the city of Galena, Illinois for the years 1893 to 1903, inclusive.

Also certificate from the City Clerk of the City of Warsaw, Illinois, certifying to a copy of the typhoid death rate in that city for the year 1902, containing the statement that the record contained no deaths for previous years.

Also certified copy of the mortuary records on typhoid fever of Kansas City, Missouri, from 1893 to 1902, inclusive certified to by the Clerk of the Board of Health of Kansas City, Missouri; also certified copy of record of deaths from typhoid fever in the City of St. Joseph, Missouri, certified to by the Clerk of the Board of Health of the City of St. Joseph, Missouri.

Also certified copy of the record showing typhoid deaths at Council Bluffs, Iowa, from January, 1893, to April 30th, 1903, inclusive, shown by the certificate of the City Clerk of Council Bluffs, Iowa.

3662 Also certified copy of typhoid death record of Lincoln, Nebraska, for the years 1893 to 1902, inclusive, as certified to by the Health Officer of said City.

Also certified copy of typhoid death record of the City of Omaha, Nebraska, for the years 1893 to 1902, inclusive, as certified to by the Commisioner of Health of said City.

Also a certificate from the Commissioner of Health of the City of Chicago, showing deaths from typhoid fever in Chicago from 1890 to 1902, inclusive.

3663 GENERAL CROW: I will ask you this question: Referring now to the question asked you on page 17 and 18 and your answers thereto, in your testimony taken yesterday afternoon, do you say now that the water of the Mississippi is rendered less safe by the reason of the water of the Illinois, of the Chicago Canal emptying into it, now than it was before the opening of said canal, from the standpoint of the health of the persons on the Missouri shore on the Mississippi river below the mouth of the Illinois who may use or wish to use the waters of the Mississippi for drinking purposes?

A. Yes sir, I should say that in my opinion it is decidedly less safe in spite of the fact that at times, as I have said, it may look better or seem better, and the whole burden, I think of my testimony would be to state what I believe to be true, that the quickening of a stream by the addition of a volume of other water, especially under conditions such as prevail on the Illinois, is a very serious menace to the people of the regions below who use that water. It is my opinion that in spite of the addition of the so-called "pure lake water;" in spite of the greater dilution resulting from that, the water of the Mississip-

pi river is constantly and beyond all reasonable doubt rendered more dangerous to the public health and to the citizens who use it, because of that addition, and under all the circum-
3664 stances which exist on the Illinois and Mississippi rivers.

Q. Now professor, in describing several epidemics yesterday, due to infected water, you did not state exactly and in detail the precise sources of contamination. Will you now do so if you can?

A. The precise sources?

Q. Yes sir?

A. I think that in the case of Plymouth I did briefly state that the dejecta of a single person who was ill with typhoid fever, and who lived on the bank of the stream supplying the reservoirs, were washed into the stream and delivered to the citizens below, causing one of the most serious epidemics that we have ever known. I did not state, I think, the conditions in the case of the great Lowell epidemic of 1890 and 1891. Those I investigated personally, and briefly described. They were as follows:—

About three and a half miles above the intake of the Lowell waterworks, and on the other side of the Merrimac river there is, as I have stated, a small stream. It is more than a brook; it is a large brook, a stream called Stony Brook. Upon this brook are certain factories, and connected with those factories are certain out houses, some of them over-hanging the stream. At one of these in particular, I found that a man named James Larkin had been in the habit of defaecating, while he was a workman in the foundry nearby. He became infected
3665 with typhoid fever and spent the greater part of several
days, while trying to work,—as he was a poor fellow,—in this overhanging privy. The dejecta fell from him—the excreta fell from him into the brook, and proceeded, as I believed, directly into the Merrimac, and crossing over the river reached the intake of the Lowell waterworks. This was the principal cause, in my judgment, of the great Lowell epidemic, and of the relatively more severe Lawrence epidemic which followed. There were other cases at the time, and these contributed more or less to the epidemic, but this was the principal case. This man's brother was also ill. His feces also went

into the stream from a wool-scouring factory near by, as did those of two of three girls, but the principal person in my judgment, was this one.

In the case of the New Haven epidemic, a family living upon the watershed had typhoid fever. I think there were two or three cases in the family. Their dejecta were thrown out on the ground near by, and in the thaw which I described yesterday, were washed into the stream.

Q. How far from the stream were they?

A. I don't remember just how far; I think they were quite a little distance, perhaps fifty feet or something like that.

Q. Was that in the winter season?

A. The typhoid was in the late winter, and the thaw
3666 came along, as I remember it, in March, very much as it
did in the Plymouth case. This was washed into the reservoir which was ordinarily used—well, it was a regular storage reservoir of the city of New Haven.

Q. But it went first into the stream?

A. It went first into the stream.

Q. And then how far down the stream?

A. I don't remember; but it was only two or there miles,—something like that,—and from the stream into the reservoir, where it underwent probably a very slight sedimentation, and storage and then passed on to the citizens.

Q. How many cases were there?

A. There were 470 cases or thereabouts, at that time from that single infection.

Q. That was the only known cause of that infection?

A. That was the only known cause, and was reported by the State Board of Health of Connecticut, to be the explanatory cause of that?

In the case of Windsor, Vermont, according to the expert employed by the State Board of Health of Vermont, whose results were adopted by that Board as sound, the infection came from a privy about a mile from a storage reservoir, a small storage reservoir—and were supposed to have been washed from
the privy into a very small stream,—a mere thread of a
3667 stream—

Q. Well, how was that washed,—by natural causes?

A. That was washed by rains, by common rains, yes, in the spring; it was at the time of the breaking up of the winter snows and was in the freshet time.—From this thread of a stream down into a larger brook, and then into the reservoir, where it was stored for a while, probably not very long, however, and then distributed to the citizens. I myself saw that privy and the local conditions, so that I can speak with some familiarity of that.

Q. How far was it from the privy vault over to the gully or place—was there water in this little stream when you saw it?

A. Yes, there was some water in the stream, and the privy was perhaps 500 feet,—the privy was only about 100 feet from the begining of the small stream, and the wash occurred right across a barnyard into that stream, which practically drained the barnyard, the small stream possibly 500 or 1,000 feet long, ran into a larger stream which went to make up the distance to the reservoir, perhaps a mile or thereabouts.

At Ithaca, New York, in the recent epidemic it is believed,—it is I think I may say, established, that the epidemic proceeded from pollution upon the water-shed of Six Mile Creek. Whether that came from a camp of Italians working on that creek and upon a new reservoir, or whether it came from other
3668 workmen upon that water-shed is not yet absolutely clear, but everyone is agreed that the epidemic came from fecal matters deposited upon the water-shed and washed into the water supply. These are the cases, I think, that I chiefly mentioned yesterday. If I go into others, I shall have to go into pollutions by more than one or two people. Do you care for any more of those?

Q. Well, it doesn't cut any figure about the number of people that caused the pollution.

A. In the Newburyport epidemic to which I referred yesterday, the pollution was, I believe, derived from the regular typhoid fever in the city of Lowell which at that time was excessive; the city of Lowell was full—yes, full of typhoid fever as the phrase went,— and a little larger epidemic than usual arose. The germs of it were carried down past Lawrence to Newburyport, and showed their effect in Lawrence and in Newburyport.

In an epidemic which I did not mention yesterday, but which

I may mention today, at Zurich, Switzerland, the typhoid fever which visited that city about 1885, was attributed to disturbance of sediment near an intake pipe and a defective filter, by which latter the city was supposed to be protected. A break had come in their intake pipe without their knowledge; their filter was imperfect; it had long been believed to be that, and the disturbance of some sediment near the intake pipe was followed by
an epidemic of typhoid fever in Zurich which has been
3669 attributed by sanitarians generally to that cause—that
source.

In a case which occured in Catherham, England in 1879, a pollution by one workman infected the water supply so that several hundred cases of typhoid fever appeared at a place in which it never had been before; that pollution taking place near the source, in a well which they were digging for additional water supply. The presence of workmen upon a watershed is a constant menace to the purity of water supply, and in addition to the population which may pollute the water, is recognized as a very serious menace. I have known within my own experience, of two cases of that kind where the temporary addition of bodies of workmen to a water-shed typhoid fever having appeared among these workmen, was regarded as a distinct and very serious danger to the communities using the water below. Two of these were within my own experience.

In the building of the great reservoir at present, of the Metropolitan Water Supply at Boston, extraordinary pains are taken with the workmen on the water-shed to see that they shall not pollute the supply, and in general, whenever any filth or fecal matter or sewage or drainage pollution or contamination or anything of that sort is added to a water-shed
in such a way that it may find access to the streams,—I
3670 will say readily find access to the streams,—it is every-
where regarded as a serious threat to the health of the
people below, who use that water.

I don't know that I need to take up your time with any more cases.

Q. Professor, will you state in general terms if you can, the relative efficiency of urban and rural population in the pollution and infection of running streams?

A. As a general proposition the urban population is very much more dangerous, very much more efficient in the pollution of waters than a rural population. It would probably be fair to say,—to put it in figures, that the urban is at least ten times as dangerous, and the reason for this is that urban populations are more often sewered, and when not sewered are more often upon streams, while the rural population is very often remote from streams, almost always without sewers, and even if the same infection occurs in a rural family as in an urban family, the chances of keeping that infection within the family and on the place, are far greater than they are in the case of an urban population. It is an obvious, general proposition that the rural population is of comparatively little importance in this respect. It is the urban population that we have chiefly to consider in the question of water supply, and sewage disposal. A farm house for instance, will have its own privy pit; its own sink
3671 drain, and even if heavy rains come, these are not readily washed into streams, except in unusual cases, as in some of those that I have mentioned.

Q. Now, professor, can you tell me anything about how much urban sewage producing population has been added to the drainage area tributary to the watershed of the Mississippi river, as it flows to the intake tower of the St. Louis waterworks, by the opening of the drainage canal?

A. Did you ask how much urban population?

Q. Yes that is by the opening of the canal, which has been brought about by cutting through the natural divide between the watershed of Lake Michigan and the Illinois River?

A. I find that it is about 63 per cent.

JUDGE JOHNS: 63 per cent of the entire urban population is added by the City of Chicago?

A. Yes sir. 63 per cent has been added to the amount above the St. Louis intake.

GENERAL CROW: Can you tell me the amount of urban population on the water-shed of the Mississippi river and its tributaries; the Illinois, Mississippi, Missouri and Des Plaines, and their tributaries, exclusive of the Sanitary District of Chicago above the intake of the St. Louis waterworks, on the
3672 basis of cities and towns of 4,000 inhabitants and more, ex-

cluding the sanitary district of Chicago from such water-shed?

A. Just read that question.

Q. (Question read)?

A. Exclusive of the sanitary district?

GENERAL CROW: Now you had better just read that again. Read a little louder; those gentlemen talking there I didn't just exactly catch it.

(Question read).

GENERAL CROW: Well, now, exclusive of the Sanitary District of Chicago, of the population of the water-shed of Lake Michigan; that is, I don't want you to consider that population on the Lake Michigan water-shed at all.

A. I make it 2,695,782. Understanding by urban population towns and cities having 4,000 and more.

Q. Have you those figures so that you could give the water-sheds of the different rivers?

A. Yes sir.

Q. Please put it in the record in that shape also?

A. According to the 1900 census the urban population defined as cities or towns having more than 4,000 population would be as follows:

Missouri river, 1,090,832,

Upper Mississippi River, by which I understand the Mis-
3673 sissippi river above the mouth of the Illinois.

Q. Above the mouth of the Missouri you mean, don't you—yes, you are correct in that; it is above the mouth of the Illinois.

A. The upper Mississippi River above the mouth of the Illinois I don't know whether that is so or not. Wait a minute. I think that's right, yes sir.

Q. Well, it is really above the mouth of the Missouri, exclusive of the Illinois.

A. That's what I understand, yes sir.

Q. It is the same proposition stated another way.

A. It is 1,219,645.

JUDGE JOHNS: The upper Mississippi?

A. The Mississippi above the Illinois. The Illinois is 385,305. All those added together make the sum I gave you a moment ago.

GENERAL CROW: Professor, I believe you did not state in connection with your description of the typhoid epidemics in Lawrence and Lowell, the period of time required for water containing typhoid germs, to pass from the Lowell sewers to the Lawrence water consumers. Do you know this period? If so, state it?

A. The mouth of the Lowell sewers is about nine miles above the intake of the Lawrence waterworks. From
3674 that point the water was pumped to the reservior of the city of Lawrence, and in that reservoir it was kept for a period varying from one to a little more than two weeks. If we add to this one to two weeks, the time spent in flowing the nine miles, and through the pumps which I suppose, or which I know from observation, would be a short time, we may say that the period was sometimes probably as long as fourteen days or more, and this amount of storage proved to be some protection undoubtedly to the people of Lawrence, but an inadequate protection because they suffered relatively more from typhoid fever than the people of Lowell did, although they were not so near the sewers of Lowell. I may add that the difference between the Lowell and Lawrence reservoirs was very striking and interesting. The Lowell reservoir was so arranged that the water passed in and out almost immediately, and the number of bacteria in the Lowell water was sometimes quite high, because of this absence of adequate storage. In Lawrence the storage was longer and was an undoubted protection of a certain sort,—a certain imperfect sort,—to the people of Lawrence, but it did not protect them adequately or perfectly.

Q. If there was any difference in the degree of infection between Lawrence and Lowell, state what it was and the reason for it if you can?

A. The difference in infection was of course, immense.
3675 Lowell received the germs from the little Stony Brook and Lawrence received those same germs, or what Lowell had not taken out, and in addition, later, the typhoid germs from upwards of 1,000 cases of typhoid fever in Lowell, and as I say the storage was a certain protection, but in spite of that the mortality rate was far higher, or considerably higher, in Lawrence than it was in Lowell.

Q. Do you know of any instance, where settling basins holding suspected water for longer periods than this one at Lawrence, have failed to protect the people using such water, from typhoid fever, and if so, what are they?

A. There are well known cases. Covington, Kentucky and New Albany, Indiana, deserve mention. At Covington, Kentucky, the water of the Ohio River, more or less polluted on the stream above, is kept at times as long as thirty-two days, and yet Covington suffers severly from typhoid fever, apparently due to infected water. At New Albany, Indiana, on the same stream, the storage is about a month in the sedimentation basin, as in the case of Covington, but typhoid fever is high in New Albany, showing that the storage for a period even as long as a month cannot be depended upon to entirely remove the typhoid germs.

Q. Well, professor, going back to your statement yesterday, as to typhoid existing quite excessively at Niagara Falls, I will ask you to state if you know, to what cause that is
3676 attributed?

A. I meant to have stated yesterday, and I think I did briefly state that it was attributed by every one who was familiar with the facts, to the sewage of Buffalo, although that sewage has passed down one of the most favorable,—or rather has passed down a stream, one of the most favorable in the world, perhaps, for dilution, aeration, oxidation, self-purification and similar processes.

Q. Is the volume of water in the Niagara River at this place, large or small?

A. Enormous, very large. They have a filter at Niagara Falls, but it is admitted that it is not perfect. It is admitted in fact that it is anything but perfect. There are times when they do not use it at all, and at such times the people suffer severely from typhoid fever. A leading physician of Niagara Falls himself told me of the remarkable prevalence of the disease there. I regard the case of Niagara Falls as it is today, one of the most instructive we have. The sewage is well diluted, well aerated, and that for a considerable distance; the distance, as I recall it, between the sewers of Buffalo and the intake at Niagara Falls, is about, about, I should suppose, eighteen miles, but I am not sure about that. It may be only fifteen.

Q. Isn't it more than that?

3677 A. I do not know. I should suppose that was about it. It may be. I have not been along the river there. I have ridden back and forth on the train, and as I remember the distance, I should suppose it was fully fifteen to eighteen miles, it may be more.

Q. Now do you know whether or not it is a fact that Niagara is considered to have the highest typhoid death rate of any city on this continent?

A. I don't know about that. It is a new matter to me, the Niagara matter. I have never made any study of it.

Q. Do you know whether or not the rate is high?

A. No, I do not. I only know that it is very high. I could look it up if you want me to do it. I have not done so. If I could send for a paper down stairs, I could settle it.

Q. You can do that a little later.

A. Yes sir.

MR. JEFFRIES: I have one question I want to ask you Professor, and that's all.

3678 Q. Assuming that the following cities are situated on the water-shed of the Missouri River; that the sewage of said cities is discharged directly or indirectly into the Missouri River as hereafter indicated, and that the respective population, according to the census of 1900, and the distance from St. Louis, as well as the number of deaths from typhoid fever in each city for the years given, is as follows:

St. Charles, Missouri; population 7, 982; 47 miles from St. Louis.

Deaths from typhoid fever:

1899,	22,
1900,	5,
1901,	6,
1902,	14.

Kansas City, Missouri; population 163,752; 403 miles from St. Louis.

Typhoid fever deaths:

1893,	59,
1894,	37,
1895,	34,

1896,	29,
1897,	38,
1898,	49,

3679

1899,	52,
1900,	49,
1901,	58,
1902,	58.

St. Joseph, Missouri; population 102,000; 501 miles from St. Louis.

Typhoid deaths:

1892,	29,
1893,	20,
1894,	22,
1895,	31,
1896	19,
1897,	13,
1898,	19,
1899,	37,
1900,	20,
1901,	12,
1902,	13.

Omaha, Nebraska; population 102,552; 676 miles from St. Louis. Typhoid deaths:

1893.	22,
1894,	40,
1895,	29,
1896,	18,

3680

1897,	22,
1898,	32,
1899,	26,
1900,	24,
1901,	23,
1902,	22.

Council Bluffs, Iowa; population 25,802; 676 miles from St. Louis. Typhoid deaths:

1893,	5,
1894,	7,

1895,	6,
1896,	8,
1897,	8,
1898,	6,
1899,	11,
1900,	6,
1901,	6,
1902,	8.

Lincoln, Nebraska; population 40,169; 745 miles from St. Louis. (All of these distances are by water); typhoid deaths:

1893,	33,
1894,	21,
1895,	23,
1896,	15,
1897,	14,
1898,	12,
1899,	13,
1900,	4,
1901,	13,
1902,	10.

3681

That the sewers of all the cities just named discharge their sewage directly into the Missouri River, except Lincoln, Nebraska, which discharges into the Platte River, and thence into the Missouri River.

Also assuming that the following cities are situated on the water-shed of the Misissippi River; that the sewage of said cities is discharged directly or indirectly into the Mississippi River above Grafton, Illinois; that their respective population according to the census of 1900, their distances from St. Louis by water and the number of deaths in each city from typhoid fever for the years named, are as follows:

Quincy, Illinois; population 36,000; 148 miles from St. Louis. Typhoid deaths:

1893,	21,
1894,	28,
1895,	25,
1896,	13,
1897,	13,

1898,	7,
1899,	6,

3682

1900,	10,
1901,	14,
1902,	17.

Keokuk, Iowa, population 14,041; 185 miles from St. Louis; typhoid deaths:

1893,	8,
1894,	13,
1895,	2,
1896,	3,
1897,	7,
1898,	9,
1899,	9,
1900,	10,
1901,	4,
1902,	8.

Burlington, Iowa; population, 23,201; 225 miles from St. Louis. Typhoid deaths:

1893,	8,
1894,	10,
1895,	8,
1896,	13,
1897,	3,
1898,	4,
1899,	8,
1900,	13,
3683 1901,	12,
1902,	11.

Rock Island, Illinois; population, 35,300; 310 miles from St Louis; typhoid deaths:

1893,	15,
1894,	13,
1895,	3,
1896,	13,
1897,	no record,
1898,	no record,
1899,	10,

1900,	14,
1901,	28,
1902,	5.

Davenport, Iowa; population, 35,254; 310 miles from St. Louis; typhoid deaths:

1893,	5,
1894,	6,
1895,	4,
1896,	3,
1897,	5,
1898,	2,
1899,	12,
1900,	14,
1901,	11,
1902,	11.

3684 Moline, Illinois; population, 7,987; 313 miles from St. Louis; typhoid deaths:

1893,	7,
1894,	9,
1895,	8,
1896,	11,
1897,	3,
1898,	5,
1899,	20,
1900,	22,
1901,	16,
1902,	7.

Des Moines, Iowa; population, 62,139; 387 miles from St. Louis; typhoid deaths:

1893,	22,
1894,	29,
1895,	30,
1896,	14,
1897,	20,
1898,	17,
1899,	13,
1900,	7,
1901,	22,
1902,	21.

Minneapolis, Minnesota; population, 102,718; 707 miles from St. Louis. Typhoid deaths: 3685

1893,	134,
1894,	107,
1895,	88,
1896,	60,
1897,	148,
1898,	86,
1899,	71,
1900,	13,
1901,	121,
1902,	66.

St. Paul, Minnesota; population 163,055; 694 miles from St. Louis; typhoid deaths:

1893,	51,
1894,	32,
1895,	38,
1896,	37,
1897,	22,
1898,	43,
1899,	30,
1900,	30,
1901,	24,
1902,	18.

Assuming that all the sewage from said cities entered directly into the Mississippi river except from Des Moines, 3686 which is discharged first into the Des Moines River and from thence into the Mississippi river about two miles below Keokuk, Iowa.

Assuming further that the following cities are situated on the watershed of the Illinois river, that their sewage flows directly or indirectly into the Illinois river; that they are situated above St. Louis and their population according to the census of 1900 and their typhoid fever deaths for the years named, are as follows:

Peoria, Illinois, population 56,000; 198 miles above St. Louis; typhoid deaths:

1896,	13,
1897,	18,

1898, 18,
1899, 12,
1900, 23,
1901, 15,
1902, 18.

Springfield, Illinois; population, 34,159; 191 miles from St. Louis; typhoid deaths 1900, 20;

1901, 10,
1902, 8.

Bloomington, Illinois population 23,286; 238 miles from St. Louis; typhoid deaths:

3687 1893, 12,
1894, 14,
1895, 15,
1896, 9,
1897, 10,
1898, 10,
1899, 9,
1900, 15,
1901, 9,
1902, 15.

Ottawa, Illinois, population, 10,588; 282 miles from St. Louis; typhoid deaths:

1893, 2,
1894, 5,
1895, 2,
1896, 2,
1897, 4,
1898, 4,
1899, 3,
1900, 3,
1901, 5,
1902, 2.

Decatur, Illinois; population, 20,754; 246 miles from St. Louis; typhoid deaths:

1893, 5,
3688 1894, 7,
1895, 2,
1896, no record,

1897,	2,
1898,	5,
1899,	7,
1900,	11,
1901,	5,
1902,	4.

Joliet, Illinois; population, 29,000; 322 miles from St. Louis; typhoid deaths:

1893,	12,
1894,	14,
1895,	no record,
1896,	12,
1897,	12,
1898,	15,
1899,	13,
1900,	13,
1901,	13,
1902,	21.

Pekin, Illinois; population, 6,420; 188 miles from St. Louis typhoid deaths:

	1900,	2,
	1901,	1,
3689	1902,	2.

Elgin, Illinois; population, 22,433; 348 miles from St Louis; typhoid deaths:

1893,	5,
1894,	3,
1895,	5,
1896,	14,
1897,	no record,
1898,	4,
1899,	5,
1900,	15,
1901,	15,
1902,	8.

Aurora, Illinois: population, 24,147; 328 miles from S Louis; typhoid deaths:

1893,	6,
1894,	12,

1895,	19,
1896,	10,
1897,	5,
1898,	10,
1899,	4,
1900,	17,
1901,	11,
1902,	2.

3690 Havana, Illinois; population and distance not given; typhoid deaths:

1893,	3,
1894,	7,
1895,	2,
1896,	5,
1897, 1898 and 1899 not given; no record;	
1900 not given,	
1901,	1,
1902,	2.

Assuming that the total number of deaths from typhoid fever occurring in the City of St. Charles, Missouri, Kansas City, Missouri, St. Joseph, Missouri, Omaha and Lincoln, Nebraska, Council Bluffs, Iowa, on the Missouri watershed, Quincy, Illinois, Keokuk, Burlington and Davenport, Iowa, Rock Island and Moline, Illinois; Des Moines, Iowa, Minneapolis and St. Paul, Minnestota, on the Mississippi river watershed above Grafton, and Peoria, Bloomington, Ottawa, Decatur, Joliet, Elgin and Aurora, Illinois, on the Illinois River watershed, was for the years 1897 to 1902, inclusive, as follows:

1897, total deaths,	369,
1898, total deaths,	357,
1899, total deaths,	385,
1900, total deaths,	338,
1901, total deaths,	442,
3691 1902, total deaths,	365.

Assuming that the total number of deaths from typhoid fever on said watersheds in all other towns and cities of 4,000 population and over have not increased for said years in any greater or different proportion than in the cities above mentioned in detail.

Assuming that the three rivers mentioned run through alluvial soil principally and the Illinois river enters the Mississippi at Grafton, 29 miles above the Chain of Rocks, Intake Tower of the St. Louis Waterworks; that the Missouri river enters the Mississippi river twenty-three miles below Grafton and six miles above the Intake Tower of the St. Louis Waterworks, located on the Missouri side of and in the channel of the Mississippi river about fifteen hundred feet from the Missouri shore.

Assuming that the City of St. Louis obtains its water from the Mississippi at the Intake Tower of the St. Louis Waterworks, by which it supplies its citizens, about 600,000 in number, with water for drinking and domestic purposes, and that no substantial change in the method of taking said water, or treatment thereof has occurred since January 17th, 1900.

Assuming that the sewage of 1,500,000 inhabitants of Chicago has since January 17th, 1900, been discharged into the Chicago Drainage Canal at Lockport, 291 miles above Grafton,
and that the sewage polluted water from said city and
3692 canal has continually since said day proceeded into the
Desplaines river at Lockport, and that the Desplaines enters into and is tributary to the Illinois river forming a continuous water course from Chicago to the Missouri shore of the Mississippi river and to St. Louis.

Assuming that in the years 1895 to 1902, inclusive, the number of deaths in Chicago from typhoid fever was as follows:

1895,	518,
1896,	751,
1897,	437,
1898,	636,
1899,	442,
1900,	336,
1901,	509,
1902,	801.

And assuming that in St. Louis for the years of 1900, 1901 and 1902, and to this day the percentage of annual typhoid fever mortality to total mortality, has increased about 73 per cent. over and above that of the years 1895, 1896, 1897, 1898 and 1899, and that the typhoid deaths in all towns and cities of over 4,000 inhabitants were about the same per population as those above given on the watersheds of said three rivers during said 3693 time, and that on the ordinary basis of computing sanitary population by taking the aggregate population of all towns and cities of 4,000 or over on the watersheds named, there was a population as follows:

on the Missouri watershed	1,090,832,
on the Mississippi river above Grafton,	1,219,645,
on the Illinois river, exclusive of the Sanitary District of Chicago	385,305,

State what, in your opinion, the sewage from 1,500,000 people of Chicago, discharged into the Drainage Canal, had to do with the increased death rate from typhoid fever in St. Louis as above stated.

Adjourned until 2:00 p. m., same day, Wednesday, May 21, 1903.

3694 Southern Hotel, St. Louis, Missouri. 2:00 P. M., Wednesday, May 21, 1903. Parties met pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

WILLIAM THOMPSON SEDGWICK,

resumed the stand for further direct-examination by Attorney-General Crow, and testified as follows:

Q. (Previous question, asked just before adjournment this forenoon, repeated).

JUDGE JOHNS: We object to that question upon the ground that the assumptions of fact in the supposing part of the question are not in accordance with the evidence already introduced, and not in accordance with the facts as will be hereafter shown and not in accordance with the facts as testified to by Dr. Teichmann, a witness for the complainant.

GENERAL CROW: Is that all the objection, gentlemen? Have you any objection, Mr. Todd?

MR. TODD: Well I join in the objection which Judge Johns made, that part of the assumptions made are not in accordance with the evidence.

A. After having carefully considered the question and the
assumptions which it contains, and in view of my studies
3695 of the typhoid fever statistics of the city of St. Louis to
which I referred in my testimony of yesterday, as stated
at that time, I believe that beyond all reasonable doubt, the principal factor of the annual increase of typhoid-fever mortality of the city of St. Louis since January 1st, 1900—

MR. JEFFRIES: Since January 17th, 1900?

A. No, since January 1st, 1900,—has been due to the pollution of the water supply of the City of St. Louis by the unpurified sewage of the sanitary district of Chicago.

Q. GENERAL CROW: What method of ascertaining that percentage did you use in fixing the increase in typhoid fever in St. Louis?

A. As referred to in my testimony of yesterday?

Q. As referred to in your answer just now and in your testimony yesterday?

A. Just read that question.

Q. (Question read).

A. I used the method known as that of "mortality percentages" in which the typhoid fever mortality is compared with the total mortality of any given district. This method is a common one among sanitarians and students of vital statistics, and is regarded as on the whole the most accurate, inasmuch as it takes no account of the population, always a dubious,—
or usually a dubious,—and uncertain factor, while the
3696 number of deaths is always, or is usually, more readily de-
termined and also more accurate. It is the same method
which I employed in my study of the typhoid fever statistics of the City of Chicago in 1892, and have often employed in my investigations.

Q. Can you state what percentage of increase you discovered from your investigations?

A. As I have already said, the increase in the annual typhoid fever mortality as measured on this basis, has been for the three years, 1900, 1901 and 1902,—let me start that again. Just strike that out.

As I have already said, measured upon this basis, the increase in the typhoid fever mortality during the years 1901, 1902 and 1903, as compared with that during the years 1895, 1896, 1897, 1898 and 1899, was 73 per cent,—

Q. Where at—the location—in St. Louis?

A. In the city of St. Louis, yes sir.

MR. JEFFRIES: Professor, assuming the same state of facts as embraced in the last hypothetical question propounded to you, and considering in addition thereto also the rural population of the water-sheds of the rivers mentioned therein, what way, if any, would it affect or modify your answer to that question?

A. My answer to that question in that case would not be materially modified, for the reason that, as I stated this
3697 morning, the wastes of rural life are, speaking broadly, usually disposed of satisfactorily from a sanitary point of view, upon the areas within which they arise. Occasionally, of course, a rural contamination may produce an epidemic of typhoid fever, but such cases are infrequent and exceptional.

Q. GENERAL CROW: On what class of water-sheds do rural populations usually make the most trouble, where the water-shed is limited or where it is wide in area?

A. The rural population is always of most serious consequence when it is within some constricted, steep-sided watershed, and located near a reservoir or a water course which passes quickly, and without much opportunity for purification, to the consumers of the water below. For example, the Plymouth epidemic that I spoke of this morning; the New Haven epidemic, and the Windsor epidemic, and I dare say others that I mentioned, were of this sort. The Ithaca epidemic also, and those which caused the epidemics at Lowell and Lawrence.

Q. Professor, assuming the fact that the waters of the Chicago Drainage Canal, taken from points in Lake Michigan, at or near the mouth of the Chicago River, were to be conveyed from Lockport to Grafton on the Mississippi river, through a canal or closed conduit so built as to maintain the same velocity of flow provided in the present canal built as far as Lockport, and further assuming the contents of this canal or conduit receive none of the Chicago sewage except such portion as now

3698 reaches Lake Michigan directly, and without entering the Chicago river; do you or do you not consider that the assumed conditions above mentioned would constitute a menace or danger to the inhabitants of the State of Missouri and especially of the city of St. Louis, drinking the Mississippi river water in its raw condition?

JUDGE JOHNS: I object to the question because it is not founded on any fact proven or proposed to be proven in this case, and upon a supposition as to the existance of a state of facts which does not now exist and never can, and which it is not proposed shall ever exist.

THE WITNESS: This does not read right, General.

GENERAL HAMLIN: I don't know whether he has got it right, there, but it was taken down right.

THE WITNESS: It says sewage of the Chicago Drainage Canal.

GENERAL CROW: Just read that again.

(Question read).

MR. TODD: I want to add an objection to the question on the ground that the quantity of water is not stated in the assumption, whether it would be small or large.

JUDGE JOHNS: I desire to add to my former objection that there is no evidence here in this case on which to base the assumption that drainage of Chicago now goes into Lake Michigan, or if there is such evidence, what quantity or amount
3699 there is of such drainage.

GENERAL CROW: Just add in that question there, in order to meet any possible objection of Mr. Todd's,—although I said the waters of the canal; say, "the waters of the drainage canal to the extent of 300,000 cubic feet per minute." Just put that in at the front of the question.

A. As I understand this question, it virtually seeks to discover whether the conveyance of water from the Lake Front of Chicago, and from a population which I have already testified has been estimated at more than a quarter of a million of people now draining directly into Lake Michigan, might be conveyed at the rate of 300,000 cubic feet a minute, through an elongated conduit reaching from Chicago to the mouth of the Illinois River.

In answer to the question I can say, and I will say that in view of all the facts and assumptions, I believe that the arrival of this water—I would rather say that the discharge of the volume of water mentioned, derived as indicated,—would in my judgment be a source of danger to persons using the water for drinking purposes on the Missouri shore and at the City of St. Louis.

MR. TODD: I move to strike the answer out on the ground that the question does not assume that this water empties into the Mississippi river, as he has assumed it in his answer.

3700 GENERAL CROW: Add "into the Mississippi river" in there. Now read the question.

(Question read as revised).

MR. TODD: Then I withdraw my motion.

Q. GENERAL CROW: Professor, will you state whether or not it is within the bounds of human possibility for any competent expert to say that in a period of low water in the Missouri river such as is likely to occur at next Christmas time, a thaw on the Illinois watershed might not endanger the lives of people using the waters of the Mississippi below the mouth of the Illinois, on the Missouri shore and at the City of St. Louis by sending to them in that water, the unpurified sewage of the Sanitary District of Chicago?

A. Suspended sewage?

Q. Yes, suspended sewage—or unpurified sewage.

A. Just read the question.

Q. (Question read).

MR. TODD: I object to the question on the ground that it is not competent for this expert to pass judgment upon the ability of some other expert, because no question can be conceived which is without the bounds of expert opinion.

GENERAL CROW: Go ahead Mr. Sedgwick.

A. I don't believe that it is.

Q. Why?

3701 A. Because in my opinion no competent expert either can or will say that any means exist at present by which such unpurified sewage can be warded off from the people on the Missouri shore and the citizens of St. Louis under those conditions.

CROSS-EXAMINATION BY GENERAL HAMLIN.

Q. Professor, Sedgwick, I believe you stated you resided at Boston?

A. Yes sir.

Q. Connected with what school?

A. The Institute of Technology.

Q. As a teacher?

A. As a teacher.

Q. Of what subject?

A. General Biology, Sanitary Science and Public Health, the history of inductive sciences; bacteriology of water and sewage, municipal sanitation, etc.

Q. Have you ever been employed by any municipality in establishing a system of waterworks or rendering opinions in regard to the same?

A. Yes sir.

Q. You have?

A. I think so, yes sir.

3702 Q. To what extent?

A. Well, not to any great extent in establishing a system of waterworks.

Q. But you are familiar with that subject, are you not?

A. Fairly familiar. I think I am very familiar with waterworks, but not so much the establishment or construction.

Q. No, but with the systems?

A. Yes, I think I am quite familiar with those.

Q. You have given that matter some study, have you not?

A. Yes sir.

Q. What system of purification from your study and experience, do you recommend?

A. It depends very much upon circumstances.

Q. Well, take where the water supply is taken from running streams?

A. I should recommend filtration in some cases and storage in others.

Q. What do you mean by storage?

A. The accumulation of water in great reservoirs so that it may be kept for some time before it is used.

Q. Without any treatment of it?

A. Without any treatment of it.

Q. Mere storage?

A. Mere storage.

3703 Q. How large size reservoirs?

A. The larger the better.

Q. Well I know, but take a city like St. Louis for instance?

A. I shouldn't recommend storage for St. Louis, probably. That would have to have filtration.

Q. That would be your judgment, filtration?

A. That would be my judgment.

Q. Filtration?

A. Yes sir.

Q. Now the last question that you answered, as I understand it, was the elimination of all the sewage of Chicago except such as might be carried into Lake Michigan and then discharged from Lake Michigan into the Drainage Canal and thence into the Desplaines River and thence by a conduit into the Mississippi river?

A. Yes sir.

Q. And that you would consider a menace and danger to the water supply of St. Louis?

A. I should.

Q. I didn't hear all of your testimony but I have looked over some of it, but as I understand it, as an expert and scientist and sanitarian, you are of the opinion that there is more or less pollution in all running streams?

3704 A. Pollution as distinct from infection, yes.

Q. And where sewage is carried into running streams, then there is infection?

A. Then there is usually infection.

Q. And that in your judgment exists in the streams to which you have testified in this case, and from the examinations and observations that you have made?

A. Such for instance as the Mississippi and the Illinois?

Q. And the Missouri?

A. Yes sir.

Q. Do you know how much population St. Louis had in 1900?

A. Yes sir.

Q. Will you state it please?

A. 575,200.

Q. Now how much sewage, if the sewage of St. Louis were discharged into the Mississippi river, according to the estimates that sanitarians use, how much sewage would be discharged into the Mississippi River from St. Louis, assuming that they do discharge their sewage into the Mississippi water?

A. That depends largely upon the consumption of water. I do not at the moment know just what that is.

Q. We will take the consumption of water that is generally used in cities; I don't know whether that varies or not.

A. Unfortunately that varies from 50 gallons up to 500
3705 per capita per day, but perhaps it might do for your purpose to say 200 gallons a head, and just multiply this number by 200.

Q. I think perhaps that is high; say 150 gallons?

A. I mean taking that amount of sewage—

Q. Yes, I know what you mean, 150 gallons to the head.

A. Yes sir.

Q. Now do you know the number of towns within a distance of 350 miles below St. Louis on the Mississippi side?

A. No sir.

Q. On the Mississippi on the Missouri side?

A. No sir, I do not.

Q. Well, if the cities or towns below St. Louis on the Missouri side of the Mississippi river, should take their water supply from the Mississippi River, they would be affected by the sewage of St. Louis, would they not?

A. If they took it unpurified, yes.

Q. I say, unpurified.

A. You say on the Mississippi side?

Q. I mean on the Missouri side. They would, would they not?

A. They would unless the dilution was so great that the sewage of St. Louis was lost in the volume. I should suppose that they would be affected.

Q. You do not attach much importance to dilution alone, do you?

3706 Q. Do you?

A. Very great.

Q. You do?

A. Yes sir.

Q. Well, take the town of St. Genevieve, that is near by; that would, according to your idea of the effect that the sewage of Chicago would have, necessarily this sewage of St. Louis would affect a town within a distance of 100 miles, wouldn't it?

A. It seems to me that is simply a question of self-purification and time and dilution.

Q. It would be the same proposition?

A. The same proposition exactly.

Q. As you would have in Chicago?

A. Yes, certainly. The same factors would hold there.

Q. I mean the same factors, but whether the same results would follow, you do not undertake to say?

A. No sir.

Q. To what extent have you studied the amount of sewage discharged into the Missouri river?

A. Only in a general way by considering the number and position of the cities above.

Q. Well, it is a large amount of sewage that is discharged into the Missouri river isn't it?

3707 A. It is.

Q. And in the Mississippi above the mouth of the Illinois, isn't there?

A. Also, yes sir.

Q. Then, according to your statement in regard to this conduit, I will ask you this, if it is not true in your opinion as an expert that if you were to eliminate all of the sewage from Chicago and take the Illinois, with the sanitary district out, and its tributaries, and the Mississippi and its tributaries, and the Missouri, and combine those waters as they are combined above St. Louis, that you would have a badly polluted stream?

A. I should say unhesitatingly that the water is and would be under such circumstances a polluted water.

Q. And that the chances are that it would be dangerous to the people of the city of St. Louis and the towns below?

A. Certainly.

Q. And you believe that the best process of making this water a potable water here, would be by filtration?

A. Well, I haven't given any study to that subject particularly, but broadly speaking—

Q. That is your judgment?

A. That is my judgment at the present moment, yes.

3708 Q. Well, then, so far as the purification of the water of St. Louis is concerned at present, and rendering it fit for domestic use here, for drinking purposes, the expense of doing that would be the same, whether the sewage of the sanitary district was in it or not, wouldn't it?

A. The probable cost of doing it at present, owing to the conditions on the various rivers and at Chicago would, I should suppose not be materially affected by the addition of the sewage of Chicago to the Mississippi River as those rivers are and as that sewage is today.

CROSS-EXAMINATION BY JUDGE JOHNS.

Q. In your study of sanitary questions, have you considered the chemistry of waters and the chemical analysis of it?

A. Only in a general way. I am not a chemist, but I am somewhat familiar with it.

Q. Do you regard yourself as a bacteriologist?

A. Yes sir.

Q. Do you consider the chemical examination of water as of any importance in determining its condition for drinking?

A. Yes I do under some circumstances.

Q. Do you under all circumstances?

A. No sir.

3709 Q. Can you determine from the chemical examination of water, so far as you know, the source of the pollution of the water, if the chemical examination reveals that it is polluted?

A. No sir, not as I understand the question.

Q. Does the chemical examination of water enable one to determine whether or not the water is polluted?

A. Sometimes it does and sometimes it does not. If the water is grossly polluted, no great skill is required. If it is only slightly polluted it might require a very high skill, or such skill might even be altogether unavailing.

Q. Have you examined the evidence here with reference to the chemical constituents in the Missouri river?

A. Not closely at all; I have looked over some of it.

Q. From what you know in a general way of the condition of the waters of the Missouri river, would a chemical analysis determine whether they are polluted?

A. Do you mean sewage polluted?

Q. I am using a general term.

A. I should think that at times it might and at times it might not.

Q. You think then that a chemical analysis of the waters of the Missouri river taken from daily samples for one year, might determine that at some times it is polluted, and at other times that you couldn't tell whether it was polluted?

A. Yes, that is it exactly. It would of course depend 3710 upon where the samples were taken from, largely.

Q. From your general knowledge of the waters of the Mississippi river, is it possible by a chemical examination, to determine whether they are polllted?

A. I should make the same answer as before, that at times it would be and at times it might not be.

Q. Could it be determined by chemical analysis, whether the waters of the Missouri or the Mississippi were infected?

A. No sir—by chemical analysis?

Q. Yes, by chemical analysis?

A. No sir.

Q. Have you studied bacteriology?

A. Yes sir.

Q. And have practiced the examination of waters for bacteria?

A. Yes sir.

Q. And in your office of teacher are continually doing so?

A. More or less. Less of late years. I used to do a good deal of it.

Q. Do you regard yourself as a bacteriologist?

A. Yes sir.

Q. Can you determine from a bacteriological examinatio of running water whether it is polluted?

A. Sometimes I can—polluted you say; not infected?

Q. Yes, polluted?

A. Sometimes I can and sometimes I cannot.

3711 Q. Are you familiar with the bacteriological examinatio of the Missouri river which has been given in evidenc here?

A. In a general way only.

Q. Can you determine from your examination of the evidence as to the bacteriological examination of the waters of th Missouri, whether the Missouri is a polluted stream?

A. From that alone you mean?

Q. Yes?

A. I suppose I could, but I very much prefer to do it i other ways. I could at times, I say, but when common sens comes in I like to use that.

Q. Can you determine from a bacteriological examinatio of the waters of the Mississippi as shown by the evidence in thi case, whether the Mississippi waters are polluted?

A. I will make the same answer; sometimes I might an sometimes I might not; sometimes I could and sometimes I coul not.

Q. Could you determine from the joint consideration of th chemical analysis and the bacteriological examination of th waters of the Missouri as shown in evidence here, whether suc waters were polluted?

A. A joint examination would be perferable to the indivi ual and separate examinations, but I should have to make th same answer—sometimes I could and sometimes I cou not.

3712 Q. And the same answer as to the waters of the Missi sippi?

A. The same as to the Mississippi.

Q. Then a chemical analysis and bacteriological examin tion of the waters of the Missouri and the Mississippi rivers, a not of themselves sufficient to determine the qualtities of t waters at all times for drinking purposes?

A. I should not consider them as competent at all times.

Q. Do you believe in the purification of water by its flowing in streams?

A. I believe in a purification of it, in a certain purification of it, or rather an uncertain purification of it.

Q. Do you believe that the waters of running streams, sewage polluted, purify themselves by the flowing of the streams?

A. To a large extent and under favorable circumstances, yes.

Q. Would the rapidity of the flow have anything to do with the degree of purification?

A. I think so, sir. As I have repeatedly said on direct-examination, it is the time-factor which comes in, and that would be profoundly modified by the rapidity of the flow.

Q. If in any given river there were numerous reaches where the flow of the water was extremely sluggish, would such reaches contribute to the purification of the waters as they passed through?

A. Of the flowing water?

Q. Of the flowing water?

3713 A. For the time during which the sluggish movement persisted, undoubtedly, yes.

Q. If the flow of waters in streams was checked by occasional dams, would that instrumentalily contribute to the purification of the water?

A. Yes sir.

Q. If the reaches of a river were in great numbers, of a sluggish current and in such a river there were dams which retarded the flow of the current, would these reaches and dams contribute to the purification of the water by any other means than sedimentation?

A. I think so, sir, they certainly would.

Q. In what other ways?

A. By detaining the germs present, and thus favoring their dying out if they lay there long enough to die out. The mere detention, apart from the sedimentation, would be a factor, in this same time-factor I have so often spoken of.

Q. If near a given river there were numbers of small lakes or ponds which filled up during the over-flow or high water of the river and which contributed to the flowing stream of the river when the water subsided, what effect would they have upon the purification of the stream?

A. Accepting the conditions given, they would contribute to the purification of the stream.

3714 Q. In the proportion in which the supposed lakes and ponds afterwards contributed to the current of the stream?

A. In a general way, yes.

Q. Wouldn't they also contribute to its purification in the time of floods by the lack of current or of flow over the surface which afterwards contained the pond, because the water there is sluggish?

A. It certainly would contribute to the purification of that part of the water which was over the lakes, but whether it would contribute to the stream as a whole during such periods—well, that factor would contribute undoubtedly to the stream as a whole. Whether the stream as a whole would really be purer or not depends on other things.

Q. If there was a flood in the Illinois river, in which the waters overflowed the banks and spread out in the bottoms, which continued for four weeks, and in the bottoms there is no perceptible current of the river and the waters in the bottoms when the river subsided flowed back again into the river, they would by standing upon the bottoms, be considerably purified, would they not?

A. Those portions which stood upon the bottoms would certainly be purified somewhat.

Q. Wouldn't it be purified so far as the sewage is concerned, very considerably? 3715

A. The water would, yes. The bottoms would not.

Q. Are you familiar with the general physical characteristics of the Illinois River?

A. I am, yes.

Q. By what means?

A. Studying from maps, and talking with men who have been up there.

Q. Not from any personal examination?

A. No sir.

Q. Do you know then that the bottom lands or overflowed lands of the Illinois river are very considerable?

A. I have understood so, yes sir.

Q. Do you know that in its overflowed stages, the Illinois River, when confined within its banks, is a sluggish stream?

A. In a general way, yes. I know that there are several dams and at times much so-called slack water.

3716 Q. JUDGE JOHNS: Do you know also that independent of the dams that in reaches of the river which are not affected by the back water of the dams, there is in ordinary stages of the Illinois river, in a great many places, and for long distances, a very slight fall?

A. Yes sir, I understand that.

Q. Do all of these things aid in the purification of the waters of the Illinois river?

A. They certainly do, sir, under ordinary conditions.

Q. Have you any opinion as to the amount of dilution of sewage polluted water which will make it reasonably safe for drinking purposes?

A. Well sir—oh, the dilution—the amount of dilution?

Q. Yes?

A. Merely?

Q. Yes?

A. I should say that no amount of dilution,—mere dilution—well now, I won't say that, because, of course—erase my answer please. The amount of dilution that would make it reasonably safe? That is a pretty hard proposition. I don't think that I can answer that except to say that a very large dilution is required to make it reasonably safe.

Q. If to one gallon of sewage from the City of Chicago there was added 100 gallons of good water, would that 3717 water be reasonably safe for drinking purposes?

A. No sir.

Q. If there was added to that one gallon of sewage 200 gallons of water would it be reasonably safe?

A. I find it very difficult to take the term "reasonably" in this question. I should not consider it safe. I hardly know what to call reasonably safe.

Q. Do you consider that there are any degrees of safety for drinking purposes of sewage polluted water?

A. Yes sir, as a practical proposition I have an opinion on that matter.

Q. What is it?

A. It is this, that as far as possible, all sewage should be kept out of drinking water, but I should be unwilling to take the ground that one microbe in the Mississippi River or one spoonful of sewage in the Mississippi River at Minneapolis, would make it impracticable for drinking purposes—or unfit for drinking purposes, at New Orleans. There are degrees of danger undoubtedly, but I don't feel able to define those degrees.

Q. Do you think that one gallon of sewage at Alton would pollute the waters of the Mississippi River at the Intake tower so as to make them unsafe for drinking?

A. It might, if it was typhoid infected.

Q. It might?

3718 A. It might. I don't say that it would; it might.

Q. Do you think that one gallon of sewage at St. Charles put into the Missouri river, and infected with typhoid germs would render the waters at St. Louis unsafe for drinking purposes?

A. It might.

Q. Would you as a general proposition, knowing that one gallon of sewage from St. Charles, infected with typhoid germs had been put into the Missouri River, pronounce the waters o the Missouri at the intake tower, unsuitable for drinking purposes, or unsafe?

A. Do you mean without purification—oh, at the intak tower. Yes, I shouldn't want to drink it and I shouldn't recommend it to others to drink if I could help it.

Q. Well then, you would consider it unsafe?

A. I should consider it unsafe, yes sir, as a general proposition, provided of course that I didn't know when that gallo was coming along. If it was put in last year and I was to g there now, it would be a different thing, but assuming—

Q. Assuming that you knew a gallon of sewage, infected with typhoid germs, was put into the water, into the channel of the Missouri river at St. Charles, at a certain time, and that you knew when that water would reach the intake tower, you
3719 would consider the water at the intake tower at the time of the arrival of this water from the Missouri, as unsafe for drinking purposes, would you?

A. As a general proposition, yes sir.

Q. Would you say the same thing as to the same amount of infected sewage at Kansas City?

A. Kansas City is—I forget how many miles away?

GENERAL CROW: Between four and five hundred miles.

A. Yes, between four and five hundred miles. Well sir, I should not want to drink the water at that time when it was expected here; but I should not be willing as a sanitarian, to say that that was unsafe for drinking.

Q. Then you are a little more particular as to yourself than as to the community in general?

A. No, but others are not as particular as I am.

Q. Well, having an equal regard for others, as for yourself, you would say that the gallon of sewage put into the waters of the Missouri at Kansas City, was unsafe, would you not, at the intake of St. Louis?

A. Assuming that the water was to be taken at the intake at the time that the arrival of that polluted water might be expected, yes sir.

Q. If a gallon of sewage were put into the Missouri river at Omaha, Nebraska, and you knew when that water would
3720 arrive at the intake tower at St. Louis, would you consider that water unsafe for drinking purposes if the sewage were typhoid infected?

A. I don't know how far that is. It is farther away,—it is six or seven hundred miles.

Q. 676 miles?

A. Of course it is hard to draw the line in cases of this kind, as it is always in sanitary matters, and if that were to come only once, I do not suppose that I should fail to consider the water arriving ordinarily as unfit for drinking purposes—I am not answering the question. Erase my answer and give me the question.

Q. (Question repeated).

A. A good deal would depend on the flow of the Missouri at that time; if it were in flood I should probably not consider that unsafe.

Q. If the Missouri was at its ordinary stage?

A. If it was polluted, I understand—

Q. If the Missouri river as you have heard of it and know it, was at its ordinary stage, would you consider that water dangerous?

A. I don't know whether I should or not, I should have to think that over. There comes a time in all questions of this kind when it is a very difficult matter to decide, and I don't
3721 know just where I should draw the line between water that I should drink with a gallon of sewage, and water I should not. I should want chemical and bacterial analyses of the water and I should want to know the conditions more than I now do,—the conditions of purification, **en route**, and a lot of things which are not included in that question.

Q. Taking your knowledge of the Missouri river, whatever it may be, and assuming that a gallon of sewage was put in that river at Omaha, Nebraska, when the river was at its ordinary stage, and that the waters in which the sewage was injected, typhoid infected sewage, arrived at the St. Louis intake; would you consider that water unsafe for drinking purposes?

A. I should like to look up the flow of the Missouri, which I do not recall now. (Witness refers to papers).

Am I obliged to answer the question?

Q. Yes, that is what you are here for?

A. I think I should consider that unsafe.

Q. If, it the year 1901 there were 13 deaths from typhoid fever at Lincoln, Nebraska; 58 in Kansas City; 6 in Omaha, 12 in St. Joseph, and 5 in St. Charles, and the typhoid bacilli in each of these cases, went by some means into the waters of the Missouri river, and some of them arrived at the intake in St. Louis, to which one of the six towns would you prefer to ascribe the bacilli arriving at the intake?

3722 A. I guess I will have to ask to have that question repeated, so I can get the number of cases, which I did not begin to take down.

Q. (Question repeated).

GENERAL CROW: That refers exclusively to typhoid rates in this city?

JUDGE JOHNS: No sir, it means everything that this witness knows.

GENERAL CROW: I simply want to understand the question myself. We have put in the record all the typhoid statistics that we have been able to gather; now we put in the rate here in St. Louis and in Chicago; now you come along and you assume that there are so many cases in a certain number of towns, and then you assume that some of those bacilli will reach the intake tower.

JUDGE JOHNS: The bacilli arriving at the intake tower.

GENERAL CROW: You ask him which one he would say would arrive there first; is that it?

JUDGE JOHNS: Now I have the right to assume to this expert, General Crow, any question that I see fit.

GENERAL CROW: Well, I have a right too, as opposing counsel, to ask you a straight plain question to understand your proposition; there is no doubt about that.

JUDGE JOHNS: I have the right to say that the question must stand upon its own interpretation.

3723 GENERAL CROW: Read the question once more.

(Question read.)

GENERAL CROW: I want to interpose an objection on the ground that the question, considering the testimony heretofore introduced regarding the typhoid death rate in the entire water-shed tributary to the intake tower of the St. Louis waterworks, so far as complainant has been able to gather the same, and considering the testimony in chief of the witness, it is entirely unintelligible, and for that reason it should not be asked.

A. The question asks to which of these I would ascribe it. As a scientific man—or, I should like to ask if I am obliged to assign them to anyone—

Q. No sir, you are not obliged to do anything you don't want to.

A. I have had to do some things I didn't want to do, already.

GENERAL CROW: You can give whatever answer you please. It is your answer and you are responsible for it, that's all.

JUDGE JOHNS: It is my question and your answer; we have joint proprietorship in the result.

A. Then erase anything that I may have said in answer, as it was only a question in regard to the bearing—

In answering this question I should have to say in the first place that I should not have any preference in the matter,
3724 except such as came from study of the facts laid down, and a weighing of the probabilities as to the origin of each of these—as to the part played by each of these. Other things equal, the nearer the infection, the greater the probability of derivation from that source. The question, however, is a very complicated one, inasmuch as it assumes a large number of cases in the upper regions of the river, and a small number at St. Charles, 47 miles away, as I believe. I should expect, as a result of the consideration of all the circumstances, that I should be entirely unable to assert any preference in the matter or to determine from which of these places the bacilli had come.

Q. From which place is it more likely they would come?

A. Those that were to be found—assuming that some were found?

Q. Yes sir.

A. These were cases or deaths?

Q. Deaths?

A. I think you stated cases, did you not?

Q. No, I think I stated deaths.

A. I think they would be more likely to have come from Kansas City.

Q. Why?

A. Because that would mean 580 cases in Kansas City,
3725 and 50 cases in St. Charles, in round numbers, assuming a mortality of ten per cent, and the likelihood of one getting into the intake at the Chain of Rocks, would, I believe, be

greater, all things considered, from 580 cases at that distance, than from 50 cases at the other distance, or from these other numbers at their respective distances. It is a matter, however, almost entirely of guess work.

Q. Do you guess that the chances would be as 5 to 58 in the above supposed question, with reference to Kansas City and St. Charles?

A. No, I took into consideration the distance of Kansas City and the dilution and other factors, en route. I shouldn't make that figure—

Q. In what proportion would you calculate the probabilities as to Kansas City with 58 deaths, and St. Charles with five deaths, as to the arrival of the bacilli from those cases of typhoid fever in the Missouri river, at the intake?

A. I should not expect to be able to calculate it with any precision, but I should like to look up the distance from Kansas City—

GENERAL CROW: It is 406 or 407 miles.

JUDGE JOHNS: Kansas City is 403 miles—taken from your assumed question—

GENERAL CROW: 408.

THE WITNESS: Now if you will read the question again.

3726 (Question and answer read.)

A. (Continuing.) Finding this distance to be 403 miles, I should be still less willing to make the calculation, believing it would be of very little value.

Q. Are you not extremely uncertain as to whether the bacilli in the supposed case at Kansas City, would arrive at the intake at all?

A. In a supposed case?

Q. Yes in a supposed case.

GENERAL CROW: In the supposed case.

JUDGE JOHNS: Well, I said in the supposed case of 58 deaths.

A. I thought you meant in the case of typhoid fever, supposing there were 58 deaths there.

Q. Yes sir.

GENERAL CROW: Now, are you talking about St. Charles or Kansas City.

JUDGE JOHNS: Kansas City.

A. Kansas City. I think I am not extremely uncertain. I could not say positively that they would arrive, any of them.

Q. Could you say positively that none would arrive?

A. No sir, I could not.

Q. Then you don't know whether they would or not?

A. No, I do not.

Q. Have you an opinion as to whether they would or not?

3727 A. Yes, I have.

Q. What is your opinion?

A. I believe they would.

Q. How far is the longest distance, either in reported cases or in your own personal experience, in which it is either known or supposed that typhoid bacilli have been transported by running waters, and caused infection in some water supply?

MR. JEFFRIES: Do you mean how long in distance or in time?

Q. How long in distance?

A. Known or supposed—I think the greatest distance known, that I now recall, is that of the Detroit epidemic, in which it was well established—apparently well established—that the infection was conveyed for about 57 miles. The assumed and supposed distances, however, are very much more than that. For example, at Pittsburgh, I myself supposed and assumed that typhoid fever germs might have come as I said in by report, from Oil City, which was 113 miles, or even, as I remarked, from points much more remote. That is, there are cases on record where the sewage of towns above, apparently influences the typhoid death rate of towns below, and where no epidemic has ever happened or been traced conclusively fastening the one upon the other.

Q. Do you place any limit upon the distance a typhoid bacillus may travel in water and live, and at the end of the 3728 journey be virulent?

A. Not if the rate of travel is fast enough.

Q. Well, take into consideration now all that you know or have heard in reference to the transporting by running waters, the typhoid bacilli, would you be willing to place a limit to the distance which those bacilli might travel, and at the end of their journey, be of sufficient strength and vitality to communicate typhoid fever to people who drank the water?

A. In the present state of the subject I should not be willing to set any limit, but the real problem would be not so much the distance as the time. If the stream were a quiet, sluggish stream, the distance, or limit which I should perhaps be willing to fix provisionally, might, in a certain case, be very much shorter than it would in a swift stream.

The Allegheny river was a swift stream; those 113 miles were covered quickly. It was a stream with a great deal of scour, so that if those deposits occurred—it was a babbling stream most of the way, scouring the stones, and while I was willing to believe that the typhoid fever in that case came as far as 113 miles, in another case with a slow stream I would not be willing to suppose that they had gone 50 miles.

Q. With reference to the Allegheny river, you expressed 3729 an opinion that typhoid bacilli might have come from Oil City. On what did you base that opinion?

A. On the rate of flow of the river, largely, and on my knowledge of the life history of the typhoid bacillus.

Q. Now is there any such thing as accurate and certain knowledge as to the life history of the typhoid bacillus?

A. Oh yes.

Q. In running water?

A. Yes sir, I think there is.

Q. Well now, what is that accurate knowledge?

A. Well, accurate,—I suppose that perhaps we should not agree on the word "accurate," but in saying "Yes," I meant by accurate, within certain limits there is accuracy. I know for example, that they may live to pass from Lowell to Lawrence—nine miles. That was as clearly proved as any proposition in nature that is not mathematical—in fact I don't know but it was a mathematical problem.

Q. Taking the Lowell and Lawrence case, your conclusion was that the waters of Stony Brook—the waters of the Merrimac River, were polluted by a single case of typhoid fever, was it not?

A. No, there was one principal case upon which I laid the greatest amount of the blame, but I mentioned the brother of
that case, and then there were others. There were all told
3730 about forty cases in North Chelmsford, which is a little
town on Stony Brook. Not all of them, however, contaminated the brook, so far as I could discover.

Q. How many did you discover that contaminated the brook?

A. I think I found about eight or ten—it seems to me, it was; some worked in the wool scouring factory, and that before they went to bed, in the early stages of the epidemic, I think there were three women who worked there, who clearly contaminated the brook, and as I remember it, there were three or four others, so that all told, I think there were somewhere between half a dozen and a dozen who contaminated the brook so far as I could discover. Others may have done so of course.

Q. Well, your examination of the cases at Lowell and Lawrence, excluded every other possible consideration of source of contamination than that which you discovered?

A. I tried to, yes.

Q. You didn't consider that it was possible that typhoid infected urine or dejecta might have been put in the reservoir or waterworks of either one of the places?

A. No sir.

GENERAL CROW: Read the last two questions and the answers. I don't think that the witness understood your second question.

3731 THE WITNESS: I think I understood that. You meant
maliciously put in?

Q. Yes, or any way.

GENERAL CROW: I don't understand your question.

THE WITNESS: I should like to modify my answer.

GENERAL CROW: I want to know whether or not you want that answer from the witness; if you do, I want to be able to ask him a question on re-direct examination.

JUDGE JOHNS: I am satisfied with the witness' answer.

GENERAL CROW: Very well.

THE WITNESS: I should like to—where I said "I tried to," I should like to add, "and I believe I did."

JUDGE JOHNS: So that there was no other possible source for the contagion in the Merrimac river, or of the infection of the Merrimac river, or the epidemic of typhoid at either Lowell and Lawrence, than those which you discovered and to which you attribute the two epidemics?

A. No other source for the excess. Of course Lowell and Lawrence had always been typhoid-ridden cities, because they drank the polluted water of the Merrimac river, but I think the epidemic, meaning by that the rise above the ordinary—I believe that of that there was no other source.

Q. You would not consider it possible that in the waters of Stony Brook, or the Merrimac River, or the reservoirs or wells, or whatever they have at Lowell and Lawrence, there 3732 might have been injected typhoid bacilli by some malicious person?

A. Yes, it is possible.

Q. Then if it is possible, the Lowell and Lawrence cases do not afford an accurate knowledge of the life history of bacilli do they?

A. The Lawrence end would— No, but assuming that he did the same thing at Lawrence, no sir, that would not, under those circumstances. WILLIAM T. SEDGWICK.

Adjourned until 10:00 A. M., Thursday, May 21, 1903.

3733 Southern Hotel, St. Louis, Missouri. 10:00 a. m., Thursday, May 21, 1903. Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

WILLIAM THOMPSON SEDGWICK resumed the stand for further cross examination by Judge Johns, and testified as follows:

THE WITNESS: Before we begin, Judge Johns, may I ask to have the last question and my answer read to me? I have not seen any report of it, and I had an impression that it was not perfectly clearly answered.

JUDGE JOHNS: It is not. I was just going to call your attention to it. I think we understood it at the time, but it does no appear so on the paper.

THE WITNESS: If I may just strike out the word "but"—

JUDGE JOHNS: No, excuse me. You may modify it. We want the record to stand. You may explain your answer if you see fit.

GENERAL CROW: Wait a minute. Just let me ask you a question, Professor.

Q. Is that your answer correctly reported?

A. I think it probably is; yes, sir.

3734 Q. Well, then you may just add any explanation to it that you wish.

A. I simply wish to make it perfectly clear, that a malicious infection of the Lowell reservoir would not have invalidated my conclusion in regard to the Lawrence epidemic.

JUDGE JOHNS: Now, from Lowell to Lawrence is nine miles?

A. Yes, sir.

Q. Along the Merrimac river?

A. Along the Merrimac river.

Q. That community is thickly populated—there is a very dense population between Lowell and Lawrence?

A. Oh, yes—it depends upon what you mean by dense.

Q. Well, more populated than the rural districts of Missouri, for instance?

A. Possibly; but it is a rural district on the whole.

Q. People live along the banks of the river?

A. More or less.

Q. And are as subject there to disease as anywhere else?

A. I suppose so; in rural communities.

Q. Yes. And as subject to typhoid fever as anywhere else?

A. As anywhere else in rural communities, yes, sir.

Q. Now, is it within the limit of probabilities that persons living near the Merrimac river between Lowell and Lawrence might have had typhoid fever?

3735 A. Yes, sir.

Q. And that their dejecta might either be thrown into the river or washed in?

A. Yes, sir.

Q. So that it is within the limit of probabilities that the contagion of Lawrence might as well have been from something occurring along the banks of the river as from the contagion of Lowell?

A. No, sir; because Lowell is a city of 80,000 people and was full of typhoid fever, while we, after careful inquiry, learned of no cases along the line between the two—

Q. Were there no cases, absolutely, between the two towns near or on the banks of the Merrimac river?

A. I don't know.

Q. It is possible that there might have been?

A. It is.

Q. Having the great epidemic in Lowell would add very strongly to the probability of there having been cases between Lowell and Lawrence?

A. Not at the same time of the epidemic in Lowell. If the people along the banks had got the typhoid from Lowell it would have come later.

Q. Yes, owing to the period of incubation?

A. Yes, sir.

3736 Q. How long after the epidemic in Lowell was the disease in Lawrence so marked?

A. As I recall it, the largest number of deaths in Lowell was in November—

Q. Of what year?

A. Of 1890, and in Lawrence, in January of 1891.

Q. When did you examine the facts as to Lowell?

A. About the first of January—between Christmas and January 1st, and aftewards:

Q. Had the disease in Lowell then subsided?

A. No, sir. It was subsiding, but it had not subsided.

Q. You arrived on the ground, then, after the greatest degree of mortality?

A. Yes, sir; that is the greatest degree of mortality at Lowell.

Q. How long had the disease been in epidemic form in Lowell when you arrived, two months?

A. Something like that.

Q. The examination which you made there was by inquiry among physicians?

A. In Lowell, you mean?

Q. Yes, sir?

A. It was in a variety of ways, partly by inquiring among
physicians, partly by a study of the cases reported to the
3737 Board of Health, partly by personal visitation of the sick
people in their own houses,—house to house visitation,
as we call it.

Q. How long after the dejecta of these two people on Stony Brook, was it that you examined the facts as to Lowell?

A. There were more than two people of course, on Stony Brook.

Q. But the two conspicuous ones, the two brothers?

A. The two principal ones, how long after, do you mean, was it—

Q. Yes, after their dejecta was cast out upon the ground, until you made the examination?

A. I don't recall exactly. It was perhaps somewhere between two and three months.

Q. How did you ascertain that their dejecta was thrown upon the ground?

A. It wasn't thrown on the ground; it was thrown into the stream.

Q. Well, how did you ascertain that it was thrown into the stream?

A. By finding—by talking with their families, and with the operatives with whom they worked in the machine shop, or foundry, and with the officers, the employers of these men in the foundry.

3738 Q. Then your information upon the subject was what
lawyers call hearsay?

A. I don't know what lawyers may call it; it is the usual method of investigation in such cases.

Q. Of course as to the facts you have no personal knowledge?

A. None other than I have stated, but in all these epidemies the investigation is done after the fact.

Q. Yes?

A. It is necessarily so, because the cases have occurred long—and sometimes a long time before, and the investigator arrives on the scene after the trouble has begun.

Q. Of course the investigator makes the best investigation possible under the circumstances?

A. He should do that certainly.

Q. And he draws his conclusions not from personal observation of the facts which he afterwards reports, but from a belief in the existence of those facts as reported to him?

A. I should say that he draws his conclusions from facts which he himslef ascertains to be true to the best of his knowledge and belief.

Q. Well, in ascertaining, for instance, that the fact was that the dejecta of the two brothers on Stony Brook were thrown into the brook, you relied upon the statements of persons who purported to know that fact?

3739 A. I did; yes, sir; and also upon the obvious fact that the man was said by the physician,—one of these men was much more important than the other,—that this one man was said by his physician to be suffering from typhoid fever, while he was working in the factory or machine shop; that he told his physician that he spent a good deal of the day in this privy; and that his fellow workmen told me that they saw him going to the privy constantly.

Q. And relying upon these statements you believed them to be true?

A. I did, yes.

Q. And therefore reported that the dejecta of the man through the privies and otherwise, went into the Merrimac river and Stony Brook?

A. Yes, sir.

Q. You then ascribed the contagion in Lowell entirely and solely to the dejecta of people ill of typhoid fever on the Merrimac or Stony Brook, above Lowell?

A. I ascribed the increase of typhoid fever in Lowell during the so-called epidemic chiefly to that source.

Q. To what did you ascribe the regular and ordinary stage of typhoid fever in Lowell?

A. I ascribed that largely to the steady use or regular use by the inhabitants of that sewage polluted water coming
3740 down the river from towns and cities above, which poured their sewage into it.

Q. Now, typhoid fever may exist almost any season of the year, in any given community?

A. Yes, sir.

Q. It is more generally prevalent in the fall and early winter than other times?

A. Broadly speaking, that is true.

Q. But any condition which may produce it may exist at any time of the year?

A. It might.

Q. And frequently does?

A. And frequently does.

Q. Did you learn how these two brothers contracted typhoid fever?

A. That was not clearly shown.

Q. Did you investigate with reference to it?

A. I did; it was supposed that they had got it in Lowell.

Q. So, in regard to Lowell and Lawrence you came to the conclusion, and so reported, that the cause of the increase of typhoid fever in the two cities, was the infection of Stony Brook and the Merrimac river, from people whose dejecta had been put into them?

3741 A. I reported that in my opinion the principal part of that increase which was regarded as the epidemic, was due to that source.

Q. While you did not take into consideration at all the possibility, owing to the prevalence of typhoid fever in Lowell, and about there,—that the disease might be communicated and continued and spread by any other means than by water infection?

A. Yes, sir; I took into consideration various circumstances and after having taken into consideration all the circumstances. I came to the conclusion already mentioned.

Q. That that was the principal one?

A. That that was the principal one.

Q. Did you come to the conclusion that that was the sole one?

A. No, sir; I think not; I did not—change that. I did not.

Q. What kind of a disease is typhoid fever, contagious, infectious, or what other term do you apply to it?

A. It is commonly called an infectious disease.

Q. It can be contracted in other ways than by the drinking of infected water?

A. Yes, sir.

Q. Is it possible that the bacillus of typhoid fever might be in the air?

A. It is possible.

Q. Is it probable that it is?

3742 A. Only to a limited extent and under peculiar circumstances.

Q. What are the peculiar circumstances?

A. The peculiar circumstances are these: If typhoid material by which I mean the material containing typhoid fever germs, is dried up, pulverized and blown into the air, it is possible that those germs may find their way into the mouths of persons who shall from that source contract the disease.

Q. Well, the material in which typhoid germs are, may be dried up, pulverized and blown away when exposed to the influence of the sun and air?

A. Yes, sir; may be.

Q. And then typhoid fever could be contracted by breathing the air in which there were those germs?

A. It is believel that it has sometimes been so contracted, but such cases are rare, and we don't ordinarily attribute—sanitarians I will say, do not ordinarily attribute any great amount of typhoid fever to this source.

Q. Now, the germs of typhoid fever may be carried about on the wings and feet of flies, may they not?

A. Yes, sir.

Q. And typhoid dejecta exposed as food or prey to these animals, or these flies, would be resorted to, and any human dejecta is infested with flies?

A. Often so, yes.

3743 Q. And they might and they frequently do carry the infection of typhoid fever to persons whose water supply is pure?

A. They may and they probably do to a certain extent, but in my opinion only to a much smaller extent than some other vehicle, such as water or milk.

Q. How does the typhoid germ get into milk?

A. In a variety of ways.

Q. It does not come through the animal, the cow?

A. It is not believed to come through the animal; broadly speaking it enters milk in the form of dirt,—dirty hands, dirty utensils, dirty water, dirty milk-men.

Q. Did you investigate the character of the milk supply of Lowell?

A. I did, with great care.

Q. With great care?

A. And found that I could not account for the epidemic reasonably on that ground.

Q. Did you find that the milk supply was absolutely excluded as the cause?

A. Broadly speaking, yes.

Q. Did you find that it was impossible that the typhoid fever in Lowell should have come from the milk supply?

A. I did.

Q. That you learned also by the examination of persons
3744 or the firm's engaged in the business of supplying milk to
Lowell, and from the health officers?

A. I learned it by a careful consideraton of the milk supply of Lowell; by a study of the vital statistics of Lowell during the epidemic, by actual inquiry at the houses of victims as to the source of their supply, and by bringing together all of these facts and focusing them upon the general character of the epidemic.

Q. And by assuming that the facts learned by this inquiry were true?

A. Yes, sir.

Q. Well, if there was in any city an epidemic of typhoid fever, could you tell by the characteristics of the disease itself, independent of other physical and local considerations, whether it was occasioned by milk or infected water?

A. You mean by the condition of the patient?

Q. Yes?

A. No, sir; I could not.

Q. Could anyone?

A. I don't believe that anyone could.

Q. When you made an examination of the water supply at Pittsburgh, did you go to Oil City?

A. No, sir—Yes, I did; but not further than to pass through.

Q. You made no examination as to the conditions in Oil
3745 City from which, or to which you thought it probable
that typhoid in Pittsburgh, was to be attributed?

A. I made no personal examination of conditions in Oil City.

Q. Do you know whether there was in Oil City an ordinance of the city, requiring that all dejecta and urine of typhoid people should be destroyed?

A. I do not. I do not now recall that there was any such ordinance.

Q. Do you know whether there was any such—

A. May I fix that answer? I do not now recall that I had any knowledge of any such ordinance.

Q. Do you know whether or not there is any such ordinance in the City of Chicago, for instance?

A. I do not.

Q. When you made the examination in Pittsburgh, was there then an epidemic of typhoid fever in Pittsburgh?

A. Yes, sir. Was there, did you say?

Q. Yes, at the time?

A. Read the question, please?

Q. (Question repeated.)

A. There was no great epidemic; there was a considerable number of cases, and typhoid fever in Pittsburgh, had long been high, so that one might say there was a continuous epi-
demic, but there was no such great increase in the number
3746 of cases over the ordinary, as there was for example, in
Lowell.

Q. Had there been previous to that a very great increase of typhoid in Oil City?

A. I don't remember.

Q. Do you know whether previous to that and during the continuance of the high rate of typhoid fever in Pittsburgh, there was an excess of typhoid fever in Oil City?

A. I cannot remember.

Q. Do you now remember whether you investigated with reference to that?

A. Let's see. I think I did.

Q. Believing now that you did, or thinking that you did, do you now remember whether there was such an excess there?

A. No, I do not.

Q. In reporting upon the condition of affairs at Pittsburgh, and the remedy to be applied, did you exclude all considerations except the existence of the Allegheny river, and the flourishing towns above Pittsburgh?

A. I did.

Q. And without knowing whether there was typhoid fever in any one of those towns, or an excessive rate of typhoid fever in any one of those towns, you ascribed the typhoid fever in Pittsburgh, to the infection of the Allegheny river from towns above it?

3747 A. I do not remember whether there was any above or not; whether I based my conclusion upon that partly or not; but in any case even supposing there had been an excess up there I should have come to the same conclusion, because they were pouring regularly a certain amount of sewage into the stream.

Q. Then all that is necessary to make the waters of a running stream unsafe, as to typhoid fever, is the fact that the sewage of populous places above, is poured into the river?

A. Broadly speaking, yes.

Q. Without regard to the fact as to whether there is or had been typhoid fever in any of the populous places above, where the sewage was poured into the river?

A. Yes sir.—Read that question.

Q. (Question repeated).

A. Yes, in taking this thing as an ordinary proposition, and taking the question as a broad one, we may always assume that sooner or later there will be in the sewage of a populous city or town, germs of typhoid fever.

Q. When was the epidemic of typhoid fever or the great increase of typhoid fever in Detroit?

A. I forget the exact date; I think it was 1892 or 1893.

Q. You did not personally examine the situation there?

A. No sir.

Q. Your knowledge of that case is taken from books and 3748 publications with reference to it?

A. And from conversations with persons personally familiar with the circumstances.

Q. And accepting these statements made by these persons who were personally familiar with it, and the statements in books and papers which you have read, as true?

A. Yes, certainly.

Q. To what point above Detroit was this infection ascribed?

A. Port Huron.

Q. Is that on the same side of the river as Detroit?

A. I think it is; I am not very familiar with the topography there.

Q. And how far away?

A. I think it is about 57 miles; I don't remember accurately.

Q. But in the neighborhood of fifty or sixty miles?

A. I think so.

Q. Are you familiar with the St. Clair River?

A. No sir.

Q. Have you ever been upon it?

A. No sir.

Q. Ever fish in the St. Clair Flats?

A. Never.

Q. Are you aware that the St. Clair river is a passageway for the water of three Great Lakes on their way to Lake Erie?

3749 A. Yes sir.

Q. And that it is a very swift stream?

A. I have understood so, yes.

Q. That on each side of it there is a very flat country full of marshes?

A. I don't know about that.

Q. That in these marshes and dwelling about them there is a large population of fishermen?

A. I have no knowledge of that.

Q. That the St. Clair flats is dotted with club houses, the resort of all classes of people during certain seasons of the year?

A. No sir, only a very general knowledge. It seems to me that something of that kind was referred to in the paper which described the epidemic.

Q. *And didn't the papers which described the epidemic,* and the persons to whom you talked, exclude all these considerations from the determination as to the cause of typhoid fever in Detroit?

A. I understand that they did.

Q. Then they took the most easily ascertained, and most prominent possible cause and ascribed to it and it alone, the entire increase in sickness?

A. I presume they did; that would be good sense.

Q. What other place have you personally examined–
3750 at what other place where there has been an increase
of typhoid fever, or an epidemic of it, have you made personal examinations?

A. Other than Lowell?

Q. Other than Lowell and Lawrence.

A. Lowell, Lawrence and Pittsburgh?

Q. And Pittsburgh?

A. Chicago, Newburyport, Massachusetts; Windsor, Vermont; Ithaca, New York; Marlborough, Massachusetts; Provincetown, Massachusetts; Bondsville, Massachusetts; Springfield, Massachusetts. Those are all that I recall at the moment. There are several other places which I could name if I could send on and get–

Q. How long a time did you use in investigating typhoid fever in Chicago?

A. How long was I in Chicago?

Q. Yes, investigating the question of typhoid fever?

A. Oh, perhaps a week.

Q. What kind of an investigation did you make there?

A. I made very little investigation in Chicago, excepting to study the general situation; but I secured documentary evidence–the reports of the Board of Health, and compared the typhoid fever death rate in Chicago with that in other cities. I also inquired into the water supply and milk supply, and other possible factors, and then, bringing the results all together arrived at my conclusion jointly with Mr. Hazen, 3751 who was able to put some of the facts into my possession.

Q. You arrived at the conclusion that the excessive rate of typhoid fever in Chicago was due to the fact that its sewage at that time was largely poured into the Lake and into the Chicago River?

A. I attributed the excess—the abnormally high death rate from typhoid fever in Chicago, after excluding as well as I could, other considerations, to the infection of the water supply of the city of Chicago by the sewage of the city of Chicago.

Q. Has there been in your knowledge a time when the City of Chicago had what might be called an average rate of typhoid fever?

A. No sir; on the contrary, I discovered that typhoid fever had nearly always been very high in Chicago.

Q. At times when it was lower than the general average, of a series of years, to what did you ascribe the typhoid fever in Chicago?

A. Partly at least to other factors than water pollution.

Q. What other?

A. The ordinary factors which contribute to cause a certain moderate amount of typhoid fever in cities generally.

Q. What are they?

3752 A. These are occasional pollutions—occasional limited pollutions of milk supply; occasional limited pollutions of food supply; occasional limited pollutions of the air, and occasional or constant limited pollutions of the water.

Q. To all of these—

A. As well perhaps—no, I will stop there.

Q. To all of these any time when the rate was below the average —

A. Excuse me, may I add one clause there?

Q. Yes sir.

A. And to similar minor factors.

Q. Well, when the average rate of sickness in Chicago, or when the sickness in Chicago from typhoid fever was less than an average of the rate for Chicago for a number of years, you didn't attribute that solely and entirely to the infection of the water supply?

A. Read that question please.

Q. (Question read).

A. That amount, do you mean?

Q. Yes?

A. No sir.

Q. When it rose above the average and far exceeded it, you attributed it to the water supply?

A. As a rule, and as a general proposition, yes.

Q. In Chicago, did the excessive rate of illness from ty-
3753 phoid fever arise suddenly, or did it it ascend gradually
from an average?

A. It was a very irregular—erase that please. The curve or line of typhoid fever in Chicago has been a very irregular one, always high, as compared with cities having a very low, or as compared with most cities having purer water supplies, but occasionally rising rapidly to much higher points.

Q. When it did rise rapidly to much higher points, to what did you ascribe the rapidity of the increase?

A. I do not now remember to what I may have ascribed it in each individual case, but generally speaking and as I remember I was able to—or I was led to believe that these rapid and unusual rises were due to the washing out of sediment from the Chicago river into the lake, and a contamination of the water supplies,—an unusual contamination of the water supplies by such dislodged sediment or other fecal materials—other polluting materials, rapidly conveyed to the intakes.

Q. Did you compare the statistics, or examine the statistics as to the rain-fall in Chicago and find that such rain-fall was coincident with—or that the increase of typhoid fever actually followed a violent rain-fall, and a sudden rise in the Chicago River?

A. As I remember it, it did so in some cases, and enough to confirm us in the general belief.

Q. Now at Newburyport, Windsor, Marlsborough, Pro-
3754 vincetown, Bondsville and Springfield, you made such ex-
aminations after the disease was most prevalent, as you
have described in these other places?

A. As a rule, yes sir. Sometimes the examination was made while the disease was still going on.

Q. Did you make bacteriological examinations of the waters of the Merrimac River at the time of the epidemic in Lowell?

A. As I remember it, I did.

Q. Did you make bacteriological examinations of the waters of the Merrimac between Lowell and Lawrence?

A. I don't think I did at that particular time.

Q. Have you ever done so?

A. I would like to add to that. I don't think I did. I don't remember. Have I ever, did you say?

Q. Yes, have you ever?

A. Between Lowell and Lawrence?

Q. Yes sir?

A. Yes, I have made examinations.

Q. When.

A. Well I don't remember. Along about that time. It may have been a year later. I was constantly engaged in work at a laboratory in Lawrence, and we frequently took samples up the river and I might even have made at that time, or had them made by my assistants.

3755 Q. You have no distinct recollection now as to a particular instance?

A. No. In a general way we were keeping watch of the river.

Q. Did you make bacteriological examinations of the waters of Stony Brook?

A. I think I did, yes sir.

Q. Frequently?

A. Yes, at that time rather frequently, if I remember rightly.

Q. Did you discover any pathogenic germs in the water?

A. No sir.

Q. Did you ever in your bacteriological examinations of water, discover pathogenic germs in running water?

A. This question is difficult to answer on account of the word "pathogenic." If we understand by the word "pathogenic" capable under all conditions, or under any conditions—

I beg pardon, I will change that—If we understand by the word "pathogenic," capable of producing disease at any time, nearly all germs are probably pathogenic,—Excuse me, I want to change that to "some time."—Capable of producing disease at some time,—nearly all bacteria might be called pathogenic. If you mean by pathogenic germs, those of the well defined infectious diseases, then I did not discover any.

Q. And never did in any bacteriological examination which you ever made?

3756 A. Of a stream?

Q. Of the waters of a running stream?

A. And never did under those circumstances.

Q. Now you have been asked here as to water-borne—

A. Excuse me one moment. Will you kindly read my answer about pathogenic. I want to get that just straight.

(Question and answer read).

Q. Of course you mean by that, Professor, in samples of running water which you have examined?

A. Certainly.

Q. You have spoken here of water-borne diseases, what did you mean?

A. By this term we generally understand diseases which are capable of being transmitted by water, which are capable of being conveyed from one person to another, from one community to another, by means of water as a vehicle.

Q. What are those diseases?

A. What?

Q. What are the names of those diseases?

A. Some of them are typhoid fever, Asiatic cholera,—or two of them I will say are typhoid fever and Asiatic cholera. As to others it is probable that some may be conveyed in this way, but the evidence is far less clear than it is in regard to these two diseases.

3757 Q. These are the only two diseases which you regard as water-borne diseases, from a clear preponderance of the evidence?

A. I should rather say these are the two diseases in which the evidence is so clear and unmistakable that there can be no shadow of doubt in regard to the conclusions drawn.

Q. Well, Asiatic cholera is an infectious disease?

A. Yes sir.

Q. And may be communicated by the air or by any of the other means by which typhoid fever may be communicated, may it not?

A. It is so believed, yes sir.

Q. And Asiatic cholera in the City of Chicago is of very rare occurrence, is it not?

A. Fortunately so, today. Formerly, however it prevailed very seriously in Chicago.

Q. Once?

A. I don't remember how many times.

Q. Do you remember whether it was ever serious at all. or existed at all, except in 1848 or 1847?

A. I don't recall, but I am under the impression that it was pretty serious there.

Q. Now the danger of Asiatic cholera in the water supply of St. Louis, coming from Chicago, is extremely remote, is it not?

3758 A. Let us have that question.

Q. (Question repeated).

A. No sir, I should not say that; I should say that inasmuch as Asiatic cholera is by no means an exterminated disease, it might turn up in a population like that of Chicago at almost any time, and that the danger to the citizens of St. Louis under the existing conditions, would be grave.

Q. But it would depend entirely upon the existence of Asiatic cholera in some other place than the City of St. Louis and above its water supply?

A. I don't understand the question.

Q. Danger in St. Louis would depend entirely upon the existence of Asiatic cholera in some one of the streams from which St. Louis derives its water supply?

A. Not wholly. There would be danger of conveyance by train, and in articles of merchandise, but I should think that the most omnipresent, the most serious danger, would be from the water supply.

Q. The danger by train and by the handling of merchandise infected, must then be added to the possible cause of typhoid fever anywhere?

A. I thought you were speaking of Asiatic cholera.

Q. Asiatic cholera and typhoid fever anywhere?

A. Repeat the question.

3759 Q. (Question repeated).

A. Yes sir.

Q. If a person in San Francisco, whose hands were infected by typhoid fever germs,—they might arrive I presume in St. Louis, and spread the disease here?

A. Yes, sir, that is a possibility.

Q. Or if he carried such germs in his clothes?

A. Yes sir.

Q. Or if some person engaged in packing goods in San Francisco should have typhoid infection on his hands, might it not be communicated to people in St. Louis or New York?

A. Yes sir.

Q. Or London?

A. Yes sir.

Q. Or St. Petersburg?

A. Yes sir.

Q. Or Moscow?

A. Yes sir.

Q. Or Karthoum, by way of Moscow and Nijni Novgorod?

A. Yes sir.

Q. As far as that?

A. I think so, if he didn't wash his hands en-route.

Q. If he didn't free himself from the infection, he might convey it around the world?

3760 A. I see no reason why not.

Q. And out of their habitat and away from anything in which they are known to essentially support themselves, these germs would live?

A. Not indefinitely.

Q. Well, in a trip around the world?

A. Oh, a long time.

Q. In a trip around the world, say sixty days?

A. I believe that they might.

Q. That would be true also of the germs of Asiatic cholera?

A. I understood that you were speaking of typhoid fever.

Q. I was, but I am asking you now as to Asiatic cholera.

A. I should be unwilling to say that Asiatic cholera might not also be conveyed around the world under certain circumstances in other things than in water.

Q. Say in clothes of persons traveling or in merchandise that went around the world?

A. Yes, and a great deal would depend of course upon the time and conditions to which the germs were subjected, but in the present state of our knowledge I see no reason why they might not be transmitted even as far as that in those ways and under favorable conditions of course.

Q. In other words it is not an impossibility?

A. I do not regard it as an impossibility.

3761 Q. Would you regard it as a probability, of a person traveling with ordinary speed around the world, that he might arrive at his departure point with the same bacilli of typhoid upon him as he started with?

A. No sir, I should expect that he would leave some en route.

Q. Would he arrive with some of them?

A. Oh, I don't know about that; he might and he might not.

Q. He might and he might not; it is very uncertain?

A. Very uncertain. The chances are that he would not. If he was a respectable person and traveling around the world he would probably take a bath and change his clothes.

Q. And strike a sleeping-car porter.

A. And he wouldn't carry them any such distance.

Q. Are the bacilli coli communis common in the waters of Massachusetts?

A. Yes—in the waters of Massachusetts, did you say?

Q. The running waters of Massachusetts?

A. That is a very difficult proposition to answer, because the running waters of Massachusetts vary very much. They are common in the sewage polluted waters of Massachusetts, or some of them.

Q. Most of the running waters in Massachusetts are sewage polluted are they not?

A. No sir, oh no; we have a great many running brooks that are quite unpolluted.

3762 Q. Is there any geographical limitation to the existence of coli communis in sewage polluted waters?

A. Geographical?

Q. Yes.

A. Not so far as I am aware.

Q. So far as you know, wherever there is sewage polluted water there may be the colon bacillus.

A. Wherever there is a sewage polluted water, there either may be now or may have been the colon bacillus.

Q. Is it a pathogenic germ?

A. The colon bacillus?

Q. Yes?

A. Not in the sense in which I define pathogenic, although it is put down in some of the books as capable of producing disease, and no doubt under certain circumstances is capable of producing disease. By that I mean it is not the cause of a well-defined, specific disease, or is not recognized as the cause of a well defined, specific disease.

Q. Is it the cause of ill-defined and general diseases?

A. Not to my knowledge.

Q. Why then is it a menace to the city of St. Louis?

GENERAL CROW: I object to the question for the reason that it assumes that the witness has testified that the colon bacillus is a menace to the city of St. Louis.

3763 JUDGE JOHNS: Yes he has, at least I have so understood him. Are the bacilli coli communis a standing menace or floating menace, or any other kind of a menace to the city of St. Louis?

A. I do not regard them so in themselves, inasmuch as every citizen of St. Louis has millions of them in his alimentary canal.

Q. Did you intend to be understood as testifying that the bacilli coli communis were dangerous to the health of the city when found in the waters supplied to the inhabitants of the city for drinking purposes?

A. Not in themselves.

Q. In what connection or relation would they be in order to become of themselves a menace?

A. They would have to be capable of producing disease.

Q. And as to whether or not they are, you are not certain?

A. I have already stated that I do not believe that they produce any specific well-defined disease, or any general and ill-defined disease.

Q. So that we may acquit the coli communis of being a pathogenic germ?

A. For practical purposes, yes.

Q. Would you acquit them in the Illinois River of being pathogenic?

3764 A. For practical purposes, yes.

Q. You have testified here about certain percents, if I understood you, of typhoid fever, based upon urban population in cities or towns of 4,000 or more inhabitants, have you?

A. The percents were not based upon urban population. I have testified to certain percentage mortalities of typhoid fever in St. Louis, in their probable relation to typhoid fever in such communities as you describe.

Q. What is the process of calculation by which you arrived at such percentages.

A. The typhoid fever mortality?

Q. Yes sir.

A. By comparing the total number of deaths from typhoid fever with the total mortality from typhoid fever, or rather with the total mortality from all diseases; or, in other words, typhoid deaths to total deaths.

Q. Do you mean to say that the typhoid deaths of the city of St. Louis since the year 1900, considered annually are about 73 per cent increased over the deaths from the same disease before?

A. Not exactly that. What I did say was this: that the increase in the average percentage mortality from typhoid fever in St. Louis, reckoned annually since January 1st, 1900, was about 73 per cent above the average percentage mortality
3765 during the previous five years.

Q. Now how did you arrive at that calculation and conclusion? I want to know the process by which you arrived at your conclusion of 73 per cent?

A. Certainly. I shall be very glad to explain that. I arrived at it in this way. In the annual reports of the Board of Health of this city will be found a table giving the total number of deaths for the number of years indicated excepting one or two which are not yet in the report, and also giving the number of typhoid fever deaths in another column, as here for instance (referring to Board of Health Report). The total annual mortality is shown in one column, and the total annual number of typhoid fever deaths in another column. If now we figure the percentage which the typhoid fever deaths were of the total number of deaths, we obtain what is known as the percentage mortality of typhoid fever for each year.

Q. That is to say as to the year 1891, the total deaths being 9530 and the deaths from typhoid being 165, the percentage mortality is as 165 to the other figure, 9530?

A. Yes sir, exactly; that is right, sir.

Q. Then you took the annual deaths for five years and the deaths from typhoid fever for five years prior to 1900, added each together and divided by 5 to find the average?

A. No, I first computed the percentage mortality for each
3766 of the five years in the way already described, and for
each of the three years following January 1st, 1900, in the same way. Added the five together and divided by 5; added the three together and divided by 3, and compared the result obtained in one case with that obtained in the other case, finding that the sum obtained in the last case, namely since January 1st, 1900, was 73 per cent higher than that obtained in the first case.

Q. As a matter of mathematics if you had added together the number of deaths in St. Louis from all causes for five years prior and the number of deaths from typhoid fever for five years prior to 1900, and then divided those sums by 5 and then added together the total number of deaths for the three years, succeeding, and including 1900, from all causes, and the total number of deaths from typhoid fever for the same period, you would have arrived at the same result, 73 per cent.

A. I don't know.

Q. Is there a rule or practice or custom among scientists of arriving at the mortality percentage in the way you have just described?

A. Is it a custom?

Q. Yes?

A. Yes sir.

Q. Is that a matter of convenience, or is it an arbitrary rule?

3767 A. There are various ways of getting at the relative efficiency of any particular disease as a death agent. The quickest way, undoubtedly, is to compare the total number of deaths from that disease, with the population ascertained or estimated. This is what is known as the "death rate" from that disease, but as I stated in my direct examination this usually involves,—and always excepting in the census year,—a consideration of population which is estimated rather than ascertained, and even based on the amount of population, is always a more or less uncertain factor. On the other hand I believe, and it is generally held, I think, that inasmuch as the total number of deaths is ascertained in most cities with considerable precision, and the deaths from any specific disease are also ascertained with similar precision, that a truer way of ascertaining the real facts is by the method which I have described as that of mortality percentages. This however, is not absolutely exact, because the reports of physicians cannot be absolutely relied upon and the recording of the deaths cannot be absolutely relied upon. It is a choice between two methods, and on the whole I prefer this one and have usually employed it.

Q. The calculation of a mortality percentage upon the basis of an urban population of 5,000 or more is an arbitrary rule or custom among sanitarians, isn't it?

A. Mortality percentages would not be computed upon
3768 the basis of population.

Q. At all?

A. At all.

Q. Well, the computation of percentages as to deaths or as to typhoid fever, based on population, only urban population, and in excess of 4,000, is an arbitrary rule, is it?

A. I do not exactly understand the question. If you mean is the assumption of 4,000 as a basis of urban population for the purposes of sanitary comparison, I should say that it is somewhat so. The basis varies. The United States census for example, classifies urban population as cities and towns of 8,000 and more, and in different sections of the country, the definition of urban population may vary somewhat, but the estimate of 4,000 as a basis for the estimate of urban population is probably a pretty fair basis.

Q. At any rate, it is an arbitrary basis?

A. More or less so.

Q. Now are you aware that on the Illinois river, the Mississippi and the Missouri, there is a very large population residing actually upon the banks, and actually upon the water, engaged in fishing largely, sometimes in agricultural pursuits, and all of whose sewage goes directly and without any intermediation whatever, into the rivers?

A. I have no doubt that that is essentially the case
3769 although I should hesitate to say "a very large" population as compared with urban communities. I should say rather, a considerable number of people.

Q. I was not instituting a comparison with either urban or other rural populations, but that a very large number of people do live upon the banks of these rivers, exist because of these rivers, and have all of their household sewage cast directly into the river?

A. I have no doubt of that fact.

Q. And you have no doubt either that among such a population, there may be, and probably is, a great deal of typhoid fever?

A. I have no doubt that there is a considerable amount of typhoid fever.

Q. Have you any doubt that the typhoid fever among such a population, on the basis of population, is very largely in excess of the rate among urban population along the same rivers?

A. That is a question that I should find it hard to answer. I should suppose that it might be greater in some cases and less in others. It would be hard to make a general statement to that question.

Q. Assume on the Illinois river 5,000 people living upon its banks directly and upon the water in house-boats, and if you place 200,000 people in what you call the urban population, wouldn't the percent of deaths from typhoid fever among

3770 those 5,000 calculated on the basis of 5,000, be very much larger than among the 200,000 urban population calculated upon the basis of 200,000?

A. That would depend entirely upon the conditions in which the 200,000 were living. If they were living in well ordered cities with good water supplies, probably I should expect, or I would say, that the amount of typhoid fever among those on the river would be larger, but if the urban population were affected, or supplied with bad water, and were living in unwholesome conditions, I do not believe the rate would be very different.

Q. That is to say, if the urban population upon the Illinois river obtained its water supplies in as crude and raw state as what we will call the river population for convenience, the per cent of mortality would be about equal between them?

A. Speaking of mortality percentages, I should expect a little higher fatality among the river population, because of the lack of medical care and the lack of proper feeding and so on and so forth, but this would be fatality rather than mortality, as we speak technically of those subjects.

Q. Wouldn't the percent of typhoid fever deaths, in this assumed river population, to that population be larger than the same per cent of the assumed urban population, having the same water supply?

A. I should expect that it would be somewhat.

3771 Q. Now in calculating these things about which you testified yesterday or the day before, you excluded all of this river population?

A. I don't understand the question.

Q. In calculating upon the basis of urban population, you excluded all of this river population from your percentages?

A. I didn't calculate any percentages on urban population. I did not calculate any percentages of typhoid fever; what I did say was that the addition of Chicago to the urban population upon the river above St. Louis, was an addition of about 63 per cent—; as far as I am aware, I didn't make any statement about the percentage of mortality in any urban population except St. Louis.

Q. Well, that was the percent to which I referred. I will say frankly I didn't have it very clear in my mind. Now, in calculating that percent, you excluded all the rural population in arriving at the per cent of population which the city of Chicago or the Drainage District bore to the total urban population. You excluded all the river population and all the rural population?

A. I simply took the facts as given in the census. The method of taking the census I am not familiar with in this part of the country. Whether they counted this river population that is floating about, into cities at the time they came
3772 around to take the census or not, I don't know; but I suppose quite a lot of them would be counted in, that would be loafing in the city, and a little later they would be out of the cities, and if they happened to be in the cities at the time the census was taken I suppose they would be counted in the urban population very largely.

Q Well, suppose that we assume that the census taken in Illinois and Missouri from precisely the same rule and precisely under the same regulations as in New York or Massachusetts, then this river population would be excluded in the computation of the urban population, wouldn't it?

A. No sir, I don't see that. It seems to me that this river population as I understand it, is a movable population, and on any one day there a lot of the men who on another day appeared on the river, might be in town, and they might give their living place or lodging house as one of the boarding houses or lodging houses along the river where they frequently stopped. I should think a lot of them might get counted as a matter of urban population. Of course a lot of them would not, but I do not think we can take all the men who are working on the river and living in houses for this purpose part of the year and so on, and exclude them from the urban population. I think we can take quite a percentage of them, but I don't know what that percentage would be.

3773 Q. But you don't know whether actually anything like that is done or not?

A. I don't know anything about it.

Q. That is a mere surmise?

A. That is a mere surmise,—No, it is not a mere surmise. It seems to me it is common sense.

Q. That assumes, doesn't it, that this river population has not sense enough to tell where it does live?

A. That is true, no doubt; if it is the same kind we have around the wharves in Boston.

Q. Now doesn't the rural population, so-called, contribute very largely to the pollution of streams in whose water-sheds they reside?

A. To the pollution, yes, using that word as distinct from infection.

Q. If some person of the rural population, who happened to have an infectious disease, he might contribute to the infection of the river, might he not?

A. He might, yes, under certain circumstances, but as a rule he would not. As I stated on my direct testimony, that is to say, taking the rural population by and large, broadly speaking, taking the whole amount of rural population, such a case would be comparatively unlikely, to infect streams. It might of course happen.

3774 Q. That is, comparatively unlikely in reference to persons in the city having drainage?

A. Yes sir.

Q. Would he be just as likely to contribute to the infection of the stream as a person living in some city or town who had not access to sewage?

A. Not quite, because in un-sewered cities and towns the system of removal of night soil from cess-pools and the like, often leads to the deposit of these things, or this thing,—or infectious materials, I will say,—leads to the deposit of infectious materials in such a way that a large quantity of the material is washed into the stream. The point is that in the rural population you have got units which are sufficient unto themselves, lead their own lives, and their wastes are usually safely disposed of on their own property. Take an un-sewered town on the other hand and after a time there comes a period when things have got to be got out of that town, or often this is the case at any rate, and these infectious materials or pollutions are removed in large masses at one time carried off away from the town, and very likely deposited somewhere where they get washed into the water courses.

Q. Do you think that process prevails in the villages and towns along the Illinois and Mississippi and Missouri Rivers, having a population of less than 4,000 inhabitants?

3775 A. I don,t know about that. I think it might in some cases.

Q. As to the population and the people living on the banks of the Missouri and Mississippi above Grafton, and the entire Illinois, that is purely a theory?

A. It is a fact as I have seen it in my experience.

Q. On these rivers in this country?

A. No sir.

Q. Then as to these rivers in this country at this time, that is purely a theory, isn't it?

A. Why, I don't know that it is purely a theory. It seems to me that it is a likelihood in many cases, or in some cases at any rate, though of course the conditions may be different here and it may not be anywhere near as true here as it is in my own experience.

Q. Isn't it a fact in sanitary science, that the pollution of rivers by what we term the rural population, is a very large factor in the consideration of the amount and degree and kind of population?

A. Of pollution, yes.

Q. But scientifically, considering infections, you do not take it into account?

A. Not so much, because in the rural population, infection to begin with, is less common, and in the second place, owing to the time factor which is apt to come in, in the partial 8776 purification of the pollutions, the infectious materials may be destroyed.

Q. Do you know whether the mortality percentage as to the rural, not the urban population along the Illinois river, from typhoid fever, is greatest in the urban or in the rural population?

A. I have no knowledge of those facts.

Q. And no means by which you can arrive at an opinion upon that point?

A. Yes, I have made studies of this question in general, and I believe that in strictly rural communities on the whole, taken in a large way, the death rate from typhoid fever is much lower than it is in cities and towns unless these be in an unusually good santiary condition. Whether that applies to this particular area or not I cannot say, but I believe that it does.

Q. On what basis do you arrive at that belief?

A. By having made computations of the rural population of Massachusetts with the urban population, defining rural and urban in my own way. Taking as I said strictly rural communities and strictly urban communities.

Q. What is a strictly rural community?

A. By strictly rural community, as I use the term I mean a farming town without any little manufacturing end to it, or any river running through it upon which there is traffic, 3777 or anything of that kind. I mean a strictly farming community.

Q. Then when you say a strictly rural population, you do not mean all the population on the watershed of a river which is in communities of less than 4,000?

A. Decidely not, for the purposes of this discussion.

Q. We will take an unscientific and common rural population, meaning by that a population not in a village or city of 4,000 inhabitants or more, including in rural population, or rather that is not included in cities of 4,000 inhabitants or more. Does not such a population enter very largely into the consideration of all sanitary questions in regard to the pollution of rivers?

A. It certainly does.

Q. Doesn't it certainly also enter very largely into the consideration of the infection of rivers?

A. Yes sir.

Q. In arriving at the conclusion that the city of Chicago added 63 per cent to the urban population of the watershed of the Missisippi, not excluding the rural population as I have defined it in the preceding question, and all the rural population where it was not in a village or city of 4,000 inhabitants or over?

A. Yes sir.

Q. Have you any means of determining what percent the rural population of the Illinois river watershed, adds to 3778 the population of the watershed of the Mississippi river?

A. I think I have. I don't know that I can lay my hands on it at this moment, but I think the data for such a comparison exists.

Q. Have you now in your mind approximately what that per cent is?

A. No, I have not.

Q. You have no definite idea of the time in which the typhoid bacilli do actually live in the waters of running streams, have you?

A. Oh yes, I think I have very definite ideas.

Q. Have you arrived at that idea from the investigations which you have made and your studies upon that subject?

A. Yes sir.

Q. Did you ever trace a typhoid bacillus by its effects from the place and time of its origin until it ceased to exist in any given case?

A. I do not understand what you mean by origin?

Q. Well, from the time they were thrown into the running water?

A. Until they ceased to exist there in that running water?

Q. Yes?

A. Yes, I think we have a certain amount of evidence of this sort.

Q. I am asking of your personal experience.

3779 A. Repeat the question.

Q. (Question repeated)?

A. Yes, I think I have. I think for example from the Newburyport epidemic I obtained a certain amount of evidence as to the time the bacilli in question remained in the flowing stream. On the other hand I do not of course know how long they may have remained in the sediment at the bottom of that stream.

Q. What was your evidence in the Newburyport case?

A. My evidence was of this character, I traced a small epidemic in Newburyport to a larger epidemic in Lowell, and I knew by the history of the disease in Lowell and in Newburyport, when I had a right to assume that the germs in the flowing water had gone by. Still, I must confess, I do not know how long they remained in the sediment of the river, if any were deposited.

Q. How long was the time in the Newburyport case during which the typhoid bacillus, in your opinion existed in the river or flowing stream?

A. As I recall the case the river appeared to have been infected from this source for about a month, but that of course doesn't mean that any one bacillus necessarily was a month in passing down the flowing stream. It may have been that
fresh infections occurred in Lowell, or it may have been
3780 that some that had come early and had been sedimented
or deposited on the bottom of the river at first, afterwards
came down, but the epidemic as I remember it, lasted about one month, the period of infection, so that the stream was infected during that period.

Q. And perhaps continuously from the sewage of Lowell?

A. There was reason to believe that it was constantly more or less infected from the sewage of Lowell.

Q. How much time elapsed from the flow of water from the sewers in Lowell to the intake or whatever it may be at Newburyport?

A. I did not determine.

Q. What is the distance?

A. I should say about 30 miles, but it is very likely 35 or 40.

Q. Is the Merrimac a rapid stream?

A. In places it is rapid.

Q. Interrupted by dams?

A. There is one dam between Lowell and Lawrence.

Q. And a sluice way around that time?

A. And there is I say, another element there, the stream is a tidal stream at Newburyport.

Q. Is it at Lowell?

A. No. sir.

3781 Q. Is it a tidal stream far above Newburyport?

A. Yes sir, quite a little distance.

Q. And with the receding tide the current would be accelerated in that part?

A. Yes sir.

Q. Well, what is your best judgment as to the time that it took the typhoid bacilli injected into the river from the sewer of Lowell to reach the intake at Newburyport?

A. The epidemic as I remembered was in August, and that was probably a period of low water in the river, in which case the Lawrence dam practically made a lake or pond, reaching back nearly to the Lowell sewers, I think I made an estimate at the time but I do not remember now what it was. I should suppose that in view of the season of the year and the probable condition of the stream, it might have been several days.

Q. Well, two or three?

A. I should say not less than three probably.

Q. Nor more than five?

A. I shouldn't suppose it would be more than five or six, but I really don't know.

Q. Then assuming that there was no other cause for the contagion or infection at Newburyport, than the infection of the river by the sewage of Lowell, you conclude that the typhoid bacillus in that particular case, actually did live in the 3782 waters of the Merrimac river for the time necessary for its transmission from the sewers at Lowell to the intake at Newburyport?

A. I have no doubt of that fact and I so reported my conclusions in reporting upon the epidemic.

Q. Now have you any other evidence upon the question as to the time that the typhoid bacillus may exist in running waters?

A. Do you mean myself personally?

Q. Yes, personally?

A. I think I have already spoken on my direct examination of the effect of the Lawrence reservoir in holding back the germs very materially in the great epidemic, where the period was considerably longer. The germs came down nine miles and were pumped presumably into the service reservoir of the city of Lawrence, and by comparing the time elapsing between the corresponding periods of the two epidemics in Lowell and Lawrence, and knowing the custom of the water department in holding the water in the reservoir, I have estimated that they may have lived in the water for between one and three weeks.

Q. And covering a distance of how many miles?

A. In that case the distance was only perhaps ten miles.

I don't mean to say that this is the only evidence that I have in this direction. From my studies at Pittsburg I was led to 3783 conclude that the germs of typhoid fever might live in running water for some days, at any rate, and come from a very much greater distance than was the case in Lawrence or Newburyport, but as I have said the element here is time, not distance I believe, mainly.

Q. Assume that a person willfully and with malice aforethought cast the germs of typhoid fever into the river with the knowledge that such typhoid germs would produce the death of some unknown person if he drank of that water and that such death under the law would be murder, and that the person charged with throwing the bacilli into the river, was charged with that consequent murder and that he must be shown to be guilty beyond reasonable doubt, if you were on the jury would you have convicted that man on the evidence you have adduced here?

MR. JEFFRIES: That charge is not in the petition, but it is very apropos of the case.

GENERAL CROW: I want to interpose an objection to it. Not but what I want the question answered, but for the reason that is so wholly foreign to any action that a man who would have intelligence enough to handle typhoid bacilli, would be guilty of, that it renders the question thoroughly inpracticable, and for the further reason that there has not been and will not be and cannot be introduced in evidence by the re- 3784 spondents any proof of the assumed fact, or in any manner tending to prove directly or indirectly any such state of facts.

JUDGE JOHNS: In reply to which I beg to say that it seems to me that it is pertinent upon the witness' understanding of the words "reasonable doubt."

Q. (Question repeated).

A. I do not understand what you mean by the evidence I have adduced here.

Q. Such as you have given here in your examination in chief, and your cross-examination as to your personal knowledge of the existence of typhoid bacilli in the waters of a supposititious running stream?

A. I cannot say what I should do under such circumstances of course, because so much would depend upon a lot of causes that are not here introduced. If the man were crazy I do not suppose I should convict him. If he set out to murder a community and succeeded in doing it, if he were a bacteriologist who knew of these things, I probably should. I don't see that I can say without knowing a good deal about the man and the conditions and everything else.

Q. Could you say whether you would or not without knowing a good deal more about what is a reasonable doubt?

A. Oh, I don't think that would trouble me so much.

Q. What is a reasonable doubt?

3785 GENERAL CROW: I object to the question for the reason that it calls for a legal opinion from the witness and he has not qualified as a legal expert.

JUDGE JOHNS: The witness has used the term "beyond reasonable doubt" on several occassions and very empatically. I want to know what that reasonable doubt is.

A. I have no objection to telling what I understand by the expression, "beyond a reasonable doubt." I mean by that an assurance of accuracy such as shall persuade me of the truth.

Q. Do you understand that a reasonable doubt is one which must rise solely from a consideration of the evidence adduced and which excludes every other reasonable hypothesis than the one of guilt, from the evidence as adduced?

GENERAL CROW: I object to that for the reason that the legal assumption that the gentleman makes is entirely wrong, unless he qualifies it by stating that a reasonable doubt is to be drawn from circumstances alone; and for the further reason that the witness has not qualified as a legal expert and has already given his opinion as to what he thinks would convince him beyond a reasonable doubt, and any further explanation from him is mere play upon words.

THE WITNESS: As I understand the question, that is my understanding of the conditions required,—I will say, if I understand the question right.

JUDGE JOHNS: And on that understanding of the 3786 term "reasonable doubt" in the case supposed just previously would you convict a man of murder, assuming him sane?

A. I cannot say what I should do under particular circumstances which might arise, but certainly if anyone maliciously threw typhoid fever germs into a stream in the expectation that they would kill people below, and if they did kill people below, I should convict him of murder.

Q. That is, if the particular typhoid fever germs which he threw into the river were shown by the evidence beyond a reasonable doubt to have produced it?

A. If the evidence was conclusive, that is the act had produced the deaths of innocent persons, if the act was knowing and intelligent, and if he knew that his act was of such a character as would be likely to produce the deaths of such persons, and if he were sane, I should.

Q. I am considering you as a scientific man, selected upon a jury, and you have the right to take into consideration all that your occupation and avocations in life leads you to know as a matter of common experience. You know as a matter of common experience in your profession and business, that you couldn't identify the bacilli at all, don't you?

A. I should hardly say that. You mean from streams?

Q. Yes, in this particular case supposed.

A. In this particular case I shouldn't expect to detect the germs, no. 3787

Q. You know as a matter of common experience, that the bacilli that killed this supposititious man, he might have received from any other of a dozen different sources?

A. Theoretically, yes.

Q. And practically?

A. Well, I should want to be sure that he couldn't have received them from other sources.

Q. Assuming that he might have received them from other sources, and that you as a juror, knew it, would you then convict the man of murder?

A. I should if the connection between his act and the result supposed or asumed, were so clear as to time, as to character, and as to every other probable condition, as to leave me in no reasonable doubt.

Q. I think that would be right, but you wouldn't arrive at a reasonable doubt about it when you considered you couldn't identify the bacilli causing death, were the bacilli thrown into the water by the defendant?

A. No, sir, I should not. That wouldn't stop me. I hold in a case of this kind, it is not necessary to discover the bacillus; it is sufficient to get the facts of epidemics and connect them as is done constantly in sanitary science and I think might be applied legally in a case of this kind.

3788 Q. In a case of this kind you wouldn't exclude every reasonable possibility from your mind, of the derivation of a death-dealing bacillus from some other source?

A. Certainly, that would be my first step. I should begin by making sure there was no epidemic above the point or at the point or below the point, and above the city or the man which would account for his death reasonably.

Q. Would you also consider that there was no isolated case, any infection from washing infected hands in the river and any other of a thousand ways in which the bacilli might be put in the river?

A. I should certainly consider those conditions and weigh them most carefully, but I shouldn't allow them any undue weight, and if this man had done this thing at that time I should feel persuaded beyond a reasonable doubt that he should be hanged.

ADJOURNED until 2:00 P. M. same day, May 21, 1903.

3789 Southern Hotel, St. Louis, Missouri. 2:00 P. M. Thursday, May 21, 1903. Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

WILLIAM THOMPSON SEDGWICK,

resumed the stand for further cross-examination by Judge Johns, and testified as follows:—

THE WITNESS: Before we begin, Judge, I should like to give you the exact dates of the Newburyport case. I have been looking it up and I find that I was wrong about the season of the year. It was not August, but mid-winter, and the cases appeared in Lowell, the supposed causative cases appeared in

Lowell in December, 1892, and reached Lawrence and Newburyport in January, 1893. I confused it with another epidemic, but in that season also the probabilities are that the river was low, although the conditions must have been different, of course, to those which would have existed in August, but still so far as any of my remarks go—I don't know that there would be any material change to make in them.

Q. Did you ever know of a case or cases of typhoid fever which were certainly traceable to typhoid bacilli which 3790 had existed for any length of time in the sediment of a running stream?

A. Will you read the question?

Q. (Question read).

A. I mentioned in my direct evidence the well known epidemic in Zurich, Switzerland, which was regarded by those who investigated it, as clearly traced to the stirring of the sediment near a broken intake pipe; and I also mentioned further the Detroit case, which to the best of my judgment and belief was conclusively traced to the stirring of sediment in the Black River near the St. Clair River.

Q. I am talking of your personal knowledge.

A. My personal knowledge. Read the question again.

Q. (Question repeated).

A. I don't think I have in my own personal experience.

Q. Your opinion as to the question, as to whether typhoid bacilli do exist in the sediment of running streams, is derived from your readings of cases in scientific books?

A. It is derived partly from my reading and partly from my general biological and bacteriological acquaintance with the typhoid bacillus, and with bacteria in general, in as much as my own studies have led me to the point of view, or points of view, which would strengthen and support the deductions drawn from my readings.

3791 Q. Well, it is an opinion, founded upon reading and study of bacteria from which you have drawn the deduction that they may live in the sediment of a running stream?

A. Well, sir, I think I may say I draw that deduction from a variety of data, largely, no doubt, from my acquaintance with literature on the subject, largely, in part from my own experiments; in part from consideration of what would be likely to go on under such circumstances, but especially from considering epidemics reported upon by others in which the investigations seemed to have been well made, and in which the results practically agreed with those of laboratory experiments and general bacteriological and biological knowledge.

Q. Do you know whether in the Zurich instance the bacillus of typhoid fever was actually discovered in the sediment which was disturbed at Zurich?

A. I don't think it is stated in the reports. My impression is that it was not. I should like to add: That, however, was at a time when our knowledge of the typhoid bacillus was less good than it is today, and while it is not readily discoverable today, it would not follow that it was not present then, as it might or not be today under similiar circumstances.

Q. Do you know of any instance either in your personal experience or as recounted or recited in books or publications, of the typhoid bacillus having been actually discovered in
3792 the sediment of a running stream?

A. I think I have read of some cases in which it was believed that it had been discovered in sediments .

Q. In what book and who was the author of it?

A. I don't remember now, and I am not even sure that such was the case.

Q. I presume that other bacilli have been discovered in great numbers in the sediments of running streams?

A. Yes, sir.

Q. And very frequently?

A. And very frequently.

Q. And without much difficulty?

A. With great ease.

Q. And because other bacilli do live, you reason that the typhoid bacilli may live or do live in the sediments of running streams?

A. I reason partly by analogy; partly from the general behavior of bacteria in organic materials, and partly from the epidemiological evidence that I have referred to.

Q. What epidemiological evidence have you that they exist in the sediments of running streams other than the Zurich instance, if that should be one?

A. And the Detroit instance. Do you care to accept that?

Q. Yes, and the Detroit—other than these two?

3793 A. Other than these two. May I have the question?

Q. (Question read.)

A. I think we have a great deal of evidence. The fact that freshets, especially the beginnings of freshets are very apt to cause epidemics of typhoid fever in communities using the water derived from such freshets, and without the contemporaneous occurrence of epidemics which would explain such increase in typhoid fever in those communities existing on the streams above, indicates very clearly that heaps of material at the mouths of sewers or in running streams when stirred up, may and do cause epidemics of typhoid fever.

Q. Would not the same course of reasoning under the same circumstances apply also as to the bacilli of typhoid fever upon the surface and banks of the streams in which freshets occur?

A. Yes, that is well known that washing in of materials from banks of streams, has, as I have stated, produced some of our worst epidemics.

Q. Having the two causes then, in the case of a freshet, the possible existence of bacteria in the sediment of the stream and the possible existence of the same bacteria on the banks, and about the immediate water drainage of the stream—surface drainage of the stream, do you prefer to attribute epidemics of typhoid fever to the sediment rather than to the surface washings?

3794 A. I should attribute them in an uncertain proportion to both and as a particularly exceptional case, like that of New Haven and several others that I have mentioned, the washing in of the stuff from the watersheds has produced disasters; but if the sediment in question was derived from a city or town constantly suffering from typhoid fever, I should expect that the stirring of the sediment thus accounted for, or thus arising, would be the major factor in the case. It would depend of course upon many intermediate conditions; but looking at it broadly and without specific and precise knowledge of each individual pollution, either of the watershed or of the water of the stream, I should say that the sediment deposited by a large urban population constantly suffering from typhoid fever, would be more likely to produce serious results below than the washing in of occasional pollutions of the watershed.

Q. Is there any positive knowledge, as distinguished from theory or deductions, as to the existence of typhoid germs in the sediment of running streams?

A. Just read that please.

Q. (Question read.)

A. Well, sir; I don't know any branch of knowledge more positive than rigid deductions, and I should say that the deductions drawn from the epidemics, like that of Detroit and at Zurich, are just as positive knowledge as we ever get in
3795 our ordinary scientific work in sanitary science, and that
they were not dependent upon theory.

Q. Well, that might be true as to sanitary science. Do you know of a single instance in which the bacteria of typhoid fever have been found,—discovered and identified, in the sediment of running streams?

A. I do not recall any such cases.

Q. Was it the former belief that the typhoid bacillus had very short longevity?

A. Opinion on that subject has varied greatly. In the early days it was supposed that the typhoid germ spent a part of its life in manure heaps and places of that kind, and had a considerable longevity outside of the human body, possibly even a requisite portion of its life history. Precisely as the *Trichina* has to go through the pig before we can get it, the old theory was that typhoid has to go through a dung-heap before a man could get it. That, however, was before the days of bacteriology and when germs were talked about only in a loose and indefinite way. Then there came a time when the typhoid was discovered and worked upon in laboratories and at first the experiments did show a short longevity, but as time has gone on, the opinion has, I think, grown among bacteriologists—it certainly has in my mind,—that those earlier experiments upon the germs
3796 were based upon laboratory conditions,—unnatural con-
ditions, and that under perhaps slightly different conditions, in mud or in manure, or in the earth, the typhoid germ might live very much longer than we had at first believed.

Q. Do bacteriologists now unanimously agree to that proposition?

A. I cannot speak of course, for bacteriologists in general, but I think I should be able to answer that question; they differ among themselves like other men.

Q. I presume that there are in the science of bacteriology schools of theories, as in medicine?

A. After a fashion, yes.

Q. And they are at war among themselves as much as doctors?

A. More or less, yes, sir.

Q. On nearly every theory of bacteriology?

A. Well, no, sir.

Q. And its usefulness?

A. No, I think they are remarkably harmonious on the principal theories. As I said in my qualifications, I have been president of the Society of American Bacteriologists, and a more peaceable company I never presided over.

Q. But they at the same time differ among themselves as to these—what may now be called modern theories?

3797 A. I don't think so, sir. Bacteriology is a rather restricted science. There are of course differences of opinion, but on the broad lines of bacteriology, and the behavior of germs in nature and in man, I think there is a remarkable unanimity.

Q. Do you know of any difference in opinion as to the pathogenic properties of coli communis among bacteriologists?

A. There have been wide differences of opinion.

Q. Do those differences still exist?

A. I do not think they do, except in the way of the definition of the term "pathogenic" which I referred to this morning.

Q. Do you know of any persons who differ with you—bacteriologists—upon the question as to the longevity of the typhoid bacillus in running water?

A. Oh, I should hardly expect that any bacteriologist would agree with me precisely, but I don't know of anyone who in my opinion would differ from me materially on that; it might be less, or more, but I think all bacteriologists are agreed that the life of the typhoid germ in water and mud and those things is uncertain and may be longer than we know.

Q. Did you ever hear any bacteriologist say that the typhoid bacillus would live in a journey of 400 miles in running water?

A. I don't know that I ever did; no, sir.

3798 Q. Did you ever hear one assert that it would live in a journey of 300 miles?

A. I don't think I ever heard a bacteriologist make any such assertions because they would be fool assertions. He doesn't know whether they would live in such a journey or not unless he knows more about the conditions,—it depends upon what kind of a journey it is and under what conditions of stream and all that sort of thing. As I have said over and over again, it is not so much the *distance,* it is the *time* that comes in, and bacteriologists don't go around making assertions of that sort, at least, the good ones don't.

Q. Do you now assert that a typhoid bacillus turned into the Illinois river from the drainage canal having its derivation in Chicago, does live in a journey down the Illinois river and the Mississippi to the Intake Tower at St. Louis?

A. I am ready to assert my conviction—my positive conviction that typhoid bacilli may and do live to make that journey.

Q. Based on what evidence?

A. Based on the whole chain of evidence which I have in my possession regarding the sanitary history of Chicago, the character of the water used to dilute the sewage of the City of Chicago, the character of the Illinois river, especially as to being subject to floods, and the character of the Mississippi river into which the Illinois empties, and with which in my
3799 opinion the Illinois freely mixes, so that such germs may be carried alive and virulent, from the people of Chicago to the Intake Tower of the St. Louis Waterworks, and further upon the vital statistics of the City of St. Louis as I have studied and compared them with the vital statistics of other communities.

Q. That belief is in direct opposition to all known experience and all knowledge as to the existence and the time of existence of typhoid germs in running streams, is it not?

A. I don't think so, sir.

Q. Well, if it is not in direct opposition, isn't it a very large and remarkable extension of the theories derived from such things as are now known to science?

A. I think I may say that it is an extension, but I am not ready to say that it is a very large or very remarkable extension, all things taken into consideration. If we bear in mind this same question of time, to which we have so constantly referred,—the evidence introduced here that the time required for the transmission of particles of water or sediment from Chicago to St. Louis, and all the other evidence that has been brought in, I don't think that it can be regarded as either very large or very remarkably extended.

Q. Suppose that a certain identified quantity of water
3800 should require in its transmission from the outlet of the
Sanitary District canal into the Illinois river, to Grafton, five weeks, would you say that the typhoid bacillus might live in that given body of water?

A. I should say that in such an identified body of sewage or water—or I suppose it would have to begin as sewage?

Q. Yes.

A. Things might happen which would cause the ready survival of the germs for that length of time, either in the moving water or in the sediment just below the moving water.

Q. Would you say the same thing if the time required were five months?

A. I should say the same thing.

Q. Would you say the same thing if the time required were one year?

A. In that case I should want to know a good deal about the sediment and the particular conditions that prevailed during that year. I can conceive of conditions which might destroy the germ en route during that time or even before that time, but I can as readily conceive of other conditions which might prolong its life, for example, the pouring of a large quantity of acid from manufacturing wastes down the canal during that year might conceivably destroy the typhoid germs in the water,
and in the sediment. On the other hand, the pouring down
3801 of an unusual amount of organic matters from the stock
yards, or from some other place, might so enrich the water as to sustain the life of the germs, perhaps even leading to a greater duration of life than that that you have stated. The fact

is that the conditions which have got to be considered in a case of this kind are so many that it is impossible to make categorical answers which will have any real value, unless all of the conditions can be assumed, and that is impossible.

Q. Then you have no explicit opinion as to the given time of one year?

A. I think the chances are good that for the greater part, the germs would have died out, but I should be afraid that some might be still alive if they came in Chicago sewage, under the conditions existing on the Illinois river; I should expect that some might still be alive—a small percentage.

Q. Would you expect that under the conditions existing on the Illinois river, that typhoid bacilli turned loose into the Illinois river at the termination of the drainage canal, would live for a period of fifteen months?

A. I should not expect very much about it; I should say that in regard to the periods beyond a few weeks or months, that in general the mortality among the bacteria—among the typhoid bacteria would be heavy; but that I should never feel certain, personally, I should never feel certain, even after
3802 one or two years, or possibly longer, that some of those were not still living there.

Q. But that is more a personal belief than a generally accepted doctrine or dogma, if I may term it so, of bacteriology?

A. I don't think that the subject has ever been investigated or studied sufficiently so that we have any "dogmas" or "doctrines" of that sort. The ordinary times given in the books are shorter than those that I have mentioned, undoubtedly, but they are given largely upon laboratory experiments, and when we come to epidemiological evidence, that has forced us thus far to prolong the time and when we take the thing in a large and broad way, and look at it biologically, I as a biologist and sanitarian can see no reason why these little fellows may not under some circumstances have their lives very extensively prolonged.

Q. And indefinitely prolonged?

A. At the present state of our knowledge indefinitely prolonged. Of course I mean in diminishing numbers, and with a small percentage left.

Q. And with decreasing vitality and virulence, as to the survivor?

A. On that ground we may, I think, fairly suppose that there is a diminishing virulence; but there again, we are very much in the dark, as we are in a good many of the finer
3803 points of bacteriology and medicine, and while I think it is probably true that under these circumstances the virulence is diminished, there is no evidence which would lead us to suppose that it would be lost or that it might not be regained pretty quickly when these possible remaining bacteria were reintroduced into the human system and had a chance to multiply.

Q. The place where typhoid bacilli thrive and multiply is in the human body, is it not?

A. The best place, yes. They thrive also in our laboratories, in our cultures under certain conditions.

Q. Yes, under favorable conditions for that purpose?

A. Under favorable conditions for that purpose, and it is possible that they may multiply in nature under unusual circumstances, e. g. tropical countries, with conditions in nature resembling those which we have in our laboratories; that is, rich food, proper temperature and everything is just right.

Q. But nothing is known as to that?

A. Nothing is known as to their so multiplying in nature, no, sir, outside of laboratories.

Q. The generally accepted theory of the most modern bacteriologists is that they do not multiply in running streams?

A. That is the general acceptation, yes, sir.

Q. Do you know any bacteria which removed from the place in which, and the medium in which it naturally thrives, and naturally exists, that positively does exist in an unnatural
3804 and unfriendly medium, for three months in nature, as distinguished from the laboratory?

A. Let us have that, please?

Q. (Question read.)

A. I don't know that I can give any positive proof of such a case, but it is commonly supposed that Asiatic cholera lives in the polluted water butts of the city of Calcutta the year around, and I think the same thing was found, or believed to be found in Egypt. There is a good deal also of indirect evidence, but valuable evidence, tending to show that diphtheria sputum and tuberculosis sputum may live outside of man and outside of the laboratory for a long time,—as long, I should say readily, as three months, and I am under the impression that in some diseases, such as smallpox and scarlet fever, there are plenty of cases on record in which the infectious material and therefore the germ, has been kept in clothing in chests and things of that sort, and when taken out even a year later, has infected human beings. I think it would be easy to collect evidence on that head, showing that germs may live outside the human body and outside of the laboratory in the environments of man for very long periods of time.

Q. If such evidence was collected as to any other one bacillus than typhoid fever, would that evidence tend to prove in your mind the same fact as to the typhoid bacillus?

3805 A. It would tend to prove it, though it would not of course necessarily establish it; but owing to the close resemblance of these various germs, biologically, a fact of that kind established in one or more other diseases would be certain presumptive evidence in favor of similar facts in regard to this disease.

Q. Are you familiar with the bacillus prodigiosus?

A. Fairly so.

Q. Do you know whether there are any varieties of that bacillus?

A. The subject of bacteriology is in such condition that it is a little difficult to answer that question directly. There are what some bacteriologists believe to be varieties, and other bacteriologists hold them to be distinct species. Following the analogy of higher forms, we should expect varieties, but on the whole I think we may say that prodigiosus as we have it in our laboratories, and as we use it is a very well defined species with no troublesome varieties turning up.

Q. On a plate in special culture it develops a red color, does it?

A. Yes, sir.

Q. And that is a peculiarity of the bacillus prodigiosus?

3806 A. Well a great many bacteria produce color, but this one produces a large amount of a peculiar color.

Q. By which it is readily identified?

A. Not by that alone but which helps very much in identifying it.

Q. Is that the distinguishing characteristic of it?

A. No, sir; that is not the distinguishing characteristic of it.

Q. What is the distinguishing appearance?

A. That, taken together with a lot of other characteristics, as to its general behavior toward gelatine and this, that and the other material.

Q. Do you know whether the bacillus prodigiosus exists in the waters of the St. Lawrence River?

A. I do not.

Q. Do you know whether it exists in Lake Erie?

A. No, I do not.

Q. Do you know whether it exists in the Columbia river?

A. I do not.

Q. Do you know whether it exists in Lake Michigan?

A. I do not.

Q. Do you know whether it exists in the Missouri river?

A. In this, and in all previous cases, I may say I do not know whether it exists, but that in my experience it is not 3807 found ordinarily, so that while I don't know whether it exists in those places or not, I should be very much surprised to find that it did exist there, unless exceptionally and rarely.

Q. Does it exist in the Mississippi river?

A. I should make the same answer as before.

Q. And the Illinois river?

A. Again the same.

Q. If it did not exist in the waters of the Missouri, the Mississippi or the Illinois, but was injected into such waters, do you know whether it would live and multiply?

A. I don't know of my own knowledge, but I should suppose that it would not.

Q. For what reason?

A. For the reason that, judging by analogy, it is not at home in our American waters, and in my experience has not been found to multiply in the waters with which I have dealt; with which I have experimented.

Q. Have you ever found it in natural waters in the United States?

A. Never.

Q. You have experimented with it from special cultures?

A. Yes sir. I have found forms that superficially resembled it, and rarely forms that came very near it, but which did not finally answer all of the tests but those forms were more common, in my experience, in deep wells than they were
3807 in running waters.

Q. Is it different in its vitality from other bacilli?

A. Each bacillus has within its bounds, its own vitality, so to speak; but broadly speaking, it is supposed to be a bacillus and fall into the same group with the other bacilli.

Q. It lives upon something, I presume, in its natural media?

A. In its natural media?

Q. Yes?

A. Yes, it was originally discovered upon starchy foods, cold bread, cold potato and things of that kind, and it derived its name, as you may have been told, from the fact that it appeared upon the communion bread in churches,—hence the name *prodigiosus*—miraculous; but that was in Europe.

Q. Can you count, or do you estimate the number of bacilli of a given kind, derived from special culture in a cubic centimeter of water?

A. May I have the question?

Q. (Question repeated).

A. In a sense, we count them, but it is such a peculiar method of counting that it comes closer to an estimate than it does to the ordinary count. We cannot pick them out, one, two three, and count them; but as you know and have been told, no doubt, we cultivate them in a jelly, make them multiply and then count the products of their multiplication which are
3809 isolated in spots; those spots being colonies. We count
their products,their descendants,so to speak, the nations or colonies which spring from them; and thus indirectly we count them.

Q. Without any knowledge or ability to ascertain how many individuals there are in any special colony?

A. Oh, quite so; absolutely—well, not without the ability, either; we can estimate the number in a particular colony, but we don't ordinarily. We can take off that colony and make a fresh plant of that and then estimate from the colony which we produce, how many there were in that colony, just as we do from a cubic centimeter of water; but that we never do, except for scientific purposes.

Q. Can you conceive of a thousand million of bacillus prodigiosus in a cubic centimeter of water?

A. I have been in the habit of doing that sir, for twenty years,—with great ease.

Q. That is easy to conceive, but very hard to understand I suppose?

A. Yes, it is—well it is not easy to conceive unless one has thought about it quite a little. I always spend quite a time in lecturing to my students in trying to get them to conceive what a cubic millimeter is even, and use illustrations—such as a granule of granulated sugar, and tell them the number that would have to be corded up in that space, in order to try to give
3810 them some idea of what millions and hundreds of millions mean.

Q. At best, all that can be said in regard to the number of bacilli of any given kind in a cubic centimeter of water, is that it is an estimate which you assume to be approximately correct?

A. Which is an approximate estimate.

MR. TODD: One or two millions doesn't make very much difference?

A. Not very much in some cases.

JUDGE JOHNS: Two or three hundred millions wouldn't make very much difference?

A. Well, it depends upon what you are after,—what you are using them for. If you simply want to make cheese, for instance, or rather, make butter, two or three hundred millions of the butter bacteria are a great advantage; if you are putting sewage in water, two or three hundred millions of typhoid germs would make a great difference.

Q. Would be awful?

A. Would make a great difference.

Q. Do you think that a medium especially prepared for the purpose and containing a thousand million of bacillus prodigiosus to the cubic centimeter, could be transported from St. Louis to Lockport by freight and the bacillus live?

3811 A. That would depend something on how long it took, I should think—Oh, you said transported by freight, and I suppose that means what? Three or four days?

Q. Oh no, 24 hours.

A. Freight trains move at different rates in different parts of the country.

Q. These were hurried.

A. I should expect, under those conditions, a slight diminution in the number—that is in 24 hours.

Q. You think they would be reduced how many millions in that time?

A. Beg pardon?

Q. How many millions do you think they would be reduced in that time?

A. Twenty-four hours?

Q. Yes sir?

A. A great deal would depend upon the culture which was used; upon the food material present. If a thousand million for example, were put in fresh food material and started on that journey, you might have ten times that number when you got there, but if you had, on the other hand, an exhausted food material, if I may use that term, when they started, then I should expect that the mortality would be rather heavy; they might fall off in numbers ten per cent.

3812 Q. If the commissary supply was not exhausted, was bounteously prepared and abundantly supplied, you think they would be able to survive?

A. I think they would, undoubtedly, and increase.

Q. And of course that is a matter of opinion rather than of any scientific knowledge.

A. Except that in a general way we know that bacteria put into abundantly rich food ordinarily grow; put into exhausted food materials, ordinarily begin to die.

Q. I presume bacteria can be transported by artificial means up a stream?

A. Yes sir.

Q. On the bottoms of boats?

A. Yes.,

Q. In buckets or any other way in which water is transported up stream?

A. Certainly, sir.

Q. So that to find bacteria of a particular kind two or three miles above the place where they were injected into the Mississippi River would not be a very remarkable thing of itself, would it?

A. Is this the Mississippi river?

Q. Yes, and the Illinois?

A. Well, I should want to know the conditions under
3813 which they were thrown in; how many were thrown in,
etc. In the Mississippi river as I saw it not long since, flowing under a south wind and with a tremendous current, whitecaps and all that, I should not expect that the bottom of a boat would carry many up stream. Of course a bucket on the boat might, but in general, the finding of them above the place in which they were put would be a surprising and a rather unusual thing, undoubtedly, provided they did not exist in that stream before.

Q. If they were put in in large enough numbers to permeate the stream, stock the stream pretty well, would it be very surprising if they were taken up the stream by boats for instance in the process of washing the decks of the boat, by pumping water from the river?

A. Then certainly, it would not be very surprising.

Q. Well, it would not be very surprising if they were conveyed up in any way in which water is ordinarily conveyed up stream?

A. If they were in that water, and the water was carried up, I should expect them to come up with it.

Q. I am desired by Judge Springer to submit to you the following questions:

Assuming that the waters and sewage coming from the drainage canal of the sanitary district of Chicago should be
wholly diverted into another channel so that none of
3814 such waters could enter into the Mississippi river or into
the intake of the St. Louis waterworks, and that the only waters that could enter such intake would come from the Missouri and Mississippi rivers, and the Illinois river, excluding the

water and sewage from said drainage canal; what is your opinion as to whether such waters would be suitable and safe for drinking and other domestic purposes in their natural condition or in the condition in which they entered the St. Louis intake?

GENERAL CROW: I object to that question for the reason that so far as respondent is concerned, it is immaterial what the character of the water supply of the City of St. Louis was prior to the time that the Chicago Sanitary District added its sewage mixed with the Chicago canal water, to that of the Mississippi, by sending it by way of the Illinois and the Desplaines river, and therefore the question asked, and the answer has no relevancy and could have no relevancy to the point at issue in this case which is, and only is, as to whether or not the mixture of the lake water with the Chicago sewage, into the Mississippi river has made less safe the water of the Mississippi river for the primary uses of the inhabitants of Missouri.

A. What is the question please?

Q. (Question repeated).

A. My opinion is that such waters would not be suitable and safe for drinking purposes in their natural state, or as 3815 they enter the intake tower of the St. Louis waterworks.

Q. In your opinion is it practicable by any of the known and recognized systems of water purification, for the waters which now enter the intake of the St. Louis Waterworks, to be so treated as to become suitable for drinking and other purposes, and as a safe water supply for the City of St. Louis?

GENERAL CROW: The same objection as last above made, with the addition that the citizens of the State of Missouri including the citizens of the City of St. Louis are entitled to the use of the waters of the Mississippi river in their ancient and accustomed flow and in their primary state, without filtration or other processes to purify the same which may have been made necessary by pollution infected by disease, put into the stream by the Sanitary District of Chicago or anyone else, and for that reason the question and any answer given to it is wholly foreign to any issue in this case.

A. Now will you read the question?

Q. (Question read).

A. Certainly; in my opinion it is perfectly possible and practicable that such water—that the waters described should be— what was that question?

Q. Question read).

A. Now erase what I began to say and I will begin again. In my judgment it is entirely possible and practicable

3816 to so treat the waters referred to in this question, that they shall be suitable and safe for drinking purposes on the part of the citizens of St. Louis.

Now kindly read the question and answer and see if I have got it straight.

(Question and answer read).

Q. JUDGE JOHNS: Do you know whether the present system of supplying water to the City of St. Louis is now substantially the same as it was prior to January 17th, 1900?

A. I do not know of my own knowledge, but I have taken pains to satisfy myself that it is substantially the same.

Q. And is it insufficient and in-efficacious?

A. For adequate purification?

Q. Yes?

A. In my judgment it is insufficient for adequate purification.

Q. And was prior to January 17th, 1900?

A. And was prior to January 1st, 1900.

3817

CROSS-EXAMINATION,

By Mr. Todd.

Q. Professor, in taking the death rate of typhoid fever in the city as a basis of calculation, why is that done in preference to taking the number of typhoid cases?

A. Oh it is a matter of taste largely. The old records were based mainly on that process.

Q. Does the death rate of typhoid indicate the number of cases?

A. Not with precision;—approximately, yes; we say for instance that for one death there were probably ten or more cases, the percentage of mortality or fatality it is better to call it, varying anywhere from twelve to eight. There are always therefore a very much larger number of cases than of deaths.

Q. In the treatment of typhoid, the number of deaths depends largely upon the treatment, doesn't it?

A. No sir, I don't believe it does—if by treatment you mean medical treatment?

Q. I mean medical treatment, medicine and attention.

A. If you allow nursing and caring and feeding, those things as a part of the treatment, as you certainly would of course, you ought to, as opposed to drugs, I should say yes.

3818 Q. Did I understand you to say that you were opposed to drugs, or "as opposed to drugs"?

A. Nursing and care as opposed to drugs.

Q. A death rate of 25 cases of typhoid fever in a town doesn't indicate the danger that the town lying immediately below on the same stream, would be subjected to, by the typhoid cases that are in the town, where the deaths occurred, does it?

A. That alone—

GENERAL CROW: Read the question again; I didn't quite catch it.

(Question repeated).

GENERAL CROW: Do you mean 25 deaths? You said 25 cases.

MR. TODD: Yes, 25 deaths.

THE WITNESS: That alone would not be a proper measure of the danger. Much would depend upon whether the town was isolated or not and whether the town below took its drinking water in such a way as to get the germs, and a lot of conditions.

Q. Have you ever estimated the quantity of fecal, and urine discharged per day from a typhoid fever patient?

A. No sir, I have not.

Q. Or the number of germs of typhoid that would be discharged by a typhoid patient in 24 hours?

A. I have not myself.

Q. Have you any opinion on the subject?

3819 A. Results have been obtained; investigations have been made and results obtained by various observers, and the general result is that the number of microbes discharged in a day from a normal human being is very large, enormous, and that in cases of typhoid fever, the probable discharge is also very large.

Q. You have given consideration to the question of typhoid in the city of St. Louis for the years prior to 1890, have you not?

A. Yes, I went back farther than that.

Q. In your testimony you used the expression that the rate of mortality in the city of St. Louis was normal.

A. Of typhoid fever?

Q. Of typhoid fever, but not in the legal sense,—I believe you used an expression of that character did you not?

A. I don't remember whether I did or not.

Q. I mean legal in the legal, not in the sanitary sense.

A. I may have used something of that sort; I don't remember using the word "legal" but I dare say I did. I did not intend however, to attach to it any special significance.

Q. For the purposes of my question I want to locate the point. What do you mean by normal as used in the connection in which you used it, professor?

A. I mean by a normal typhoid fever death rate, a death
rate which places a city or town having it, in the ranks of
3820 cities and towns having good water supplies and good
general sanitary arrangements and conditions, other good
sanitary arrangements and conditions.

Q. If it should appear that there were 788 cases of typhoid in the city of St. Louis in 1893, would that be a normal rate, while there would be only 215 deaths.

A. As a matter of fact, in 1893, if I remember right, the number was large, and was apparently connected with the great epidemic of 1892. I should like to consult my charts.

Q. The figures I give were taken from Dr. Ravold's chart.

A. I don't remember what he gives, but I have the facts right here and I will see in half a minute. In 1893 there were only 215 deaths.

Q. And 788 cases?

A. I don't know about the number of cases.

Q. (Question repeated)?

A. That would not be a normal number of cases; it would be too small. The presumable number of cases from that number of deaths, would be nearer 1500 to 2000, and all that means is that the physicians did not report the cases, as often hap-

pens in epidemics of typhoid fever. They fail to report the cases as they should do, and only the more careful physicians
3821 doing that, the upshot is we seem to get a tremendous fatality, when as a matter of fact it is about normal. But that number of deaths in that year was higher than St. Louis has had since 1884, or at least the mortality percentage was higher. I don't know about the number of deaths.

Q. In 1899 if it should appear that there were 130 deaths and 908 cases of typhoid, would that be normal?

A. That would come nearer.

Q. In a sanitary sense?

A. That would come practically down to normal. That would be for a big city of this character, I should say, a very good showing in respect to typhoid fever, but here again the number of cases is rather small for the number of deaths.

Q. What would be the normal death rate from a sanitary standpoint for typhoid in a city of the population of St. Louis?

A. About that which St. Louis had in 1895 to 1899 inclusive, although it might be lower than that under the most favorable circumstances, but as I have already stated, that was below the typhoid mortality percentage at Boston during those years.

Q. Professor, to what do you attribute the presence of typhoid, from 1895 to 1900 inclusive, in the city of St. Louis, the five years?

A. I attribute the typhoid fever in St. Louis during the
3822 period mentioned, from 1895 to 1899 inclusive, to a variety of causes, each of which probably played its proportionate part in the making up of the total. For example, I have no doubt that the water may have contributed something to the net result; milk something, oysters something, secondary infection,—by which we mean contagion, practically, dirty hands and that sort of thing, from person to person,—and also infected foods, other than milk and oysters, such as watercress, celery and unwashed fruits, flies and the numerous factors, each of which goes to keep up in all of the cities of the world a small but rather constant amount of typhoid fever.

Q. In regard to oysters, professor, how is typhoid fever transmitted through oysters?

A. In regard to oysters the method of transmission is as follows: The oysters are frequently grown or placed for a time in sewage polluted streams, and as the act of raking up,—"tonging" as they call it,—tonging the oysters to get them up with tongs, causing the valves or shells of the oysters to close suddenly, they are very apt to include within the shells a certain amount of the water in which they may have been lying, and if that water is sewage polluted, or rather if it is infected,—typhoid infected,—an oyster may carry between its shut valves a mouthful or more of the so-called juice of the oyster, which is really sea water or in this case diluted sewage which 3823 may in some cases, and has been proved in some cases to, convey the disease.

Q. Do you know of anyone who has ever discovered the germ of typhoid in an oyster?

A. I think that some English and French bacteriologists have done so or claim to have done so.

Q. Can you give me the name of any such?

A. I can not give you the name, and I don't know that I could with certainty give you the name of the book in which the results were put down, but there are two or three well known books on infectious diseases in shell-fish, and I think it is mentioned in one of those two or three.

Q. Do you know whether any of those books—

GENERAL CROW: Do you know of any recent case of prominence where it is supposed to have occurred? Where they found the bacillus. I mean where it is supposed to have occurred, the Vanderbilt case?

A. The number of epidemics—or the number of cases of typhoid fever, which are attributed to the bacillus is quite considerable.

MR. TODD: Is that among the poorer class or the richer class?

A. Well, sir, the late Governor of Massachusetts, Roger Wolcott, was supposed to have died from that source, and 3824 Mr. Cornelius Vanderbilt, who has been ill with typhoid fever lately, was supposed to have got it from that source, and it is general in this country among well to do classes, that is true; but in Italy, in Naples, typhoid fever is said to be very common among the poorer people who buy there fish and oysters and cheaper sorts of food and eat them raw.

Q. Do you know whether in these books to which you have made reference whether the scientists who made them, claim to have found the bacillus of typhoid in an oyster?

A. I am under the impression that one or two of them have done that. I cannot state positively.

Q. In regard to Wolcott and Vanderbilt. Do you know whether they ate celery with their oysters or not?

A. I presume they did. Personally I have never felt entirely satisfied that the case was made out. It is easy to say one got it from eating oysters. That saves a lot of trouble and you don't have to make investigations, and people jump to conclusions in medicine,—as they do in bacteriology.

Q. A kind of a leap-frog game, is it professor, when they can't find the cause, to attribute the cause the most easily secured as the explanation of the typhoid?

A. That may have been true or may be true in isolated cases, but we have on record one phenomenal epidemic in which the thing was proved as clearly as ever anything is proved.
3825 A lot of students of Wesleyan University, contracted typhoid fever from eating oysters which had been placed upon a bed in the Quinnippiac River at New Haven Connecticut, and so located that the sewer from the house of the owner of the oysters, emptied right over the oyster bed, while his daughter was sick from typhoid fever in the house and the germs from her unquestionably must have infected the oysters.

Q. That being true, do you know or have you made any investigation of the number of oysters that are consumed in St. Louis, or have been consumed in St. Louis for the last five years?

A. I have not.

Q. Are you prepared to state that the typhoid in St. Louis is not due to over-indulgence in these bi-valves?

A. I am.

Q. If you don't know the source of the oysters, whether they were sewage polluted or not, and the number of oysters that were consumed here by the people and whether those oysters were infected, how can you attribute any other cause to the typhoid since 1900?

A. The increased typhoid you mean?

Q. Yes.

A. This seems to me a very simple matter.

Q. For the years 1900, 1901 and 1902?

3826 A. This seems to me a very simple matter. Three years stated in the question at stake, 1900, 1901 and 1902. Repeat the question.

Q. (Question repeated).

A. Well, I have no doubt that some typhoid infected oysters may have been eaten in St. Louis during those years and may have caused cases of typhoid fever. The amount of increase in the disease, considering the size of the city would mean such a vast change in the habits of the people or in the condition of the oyster supply of the United States, that in my judgment it would be unreasonable to attribute the rise in question to any such source, particularly as oyster epidemics are not frequent, and are local, while the rise in typhoid fever in St. Louis has been persistent. It would be unreasonable and opposed to all our knowledge of sanitary science to look for the increase chiefly in infected oysters.

Q. Is it not a fact, professor, that the demand for oysters has increased at an enormous rate throughout the country within five or six years over what it was the previous five years?

A. I think not. I think the demand has fallen off a good deal. After the great oyster scare of 1894, when this epidemic which I have described took place, the oyster men of Boston almost had to go out of business for many months, and 3827 every now and then today they have to take, not only in Boston, but in other places, Baltimore and Washington—they have to take pains to announce that they get their oysters from a particularly pure source of supply, so that I don't believe that the consumption of oysters has increased inordinately or out of proportion, or much out of proportion to the increase of population.

Q. If statistics should show that the increase be as I stated in my former question, would that have any effect upon your former judgment?

A. It would have an effect, but assuming, as I suppose to be the case that some at least of the oysters of St. Louis come from the east, and knowing the general state of feeling among the oyster men, and the pains they are taking, and the influence that Boards of Health are bringing to bear upon them to improve their oyster-layings and the like, if a considerable increase in the consumption should be shown, as I daresay may be, owing to the prosperous times we have today, that would not materially alter my position.

Q. Wouldn't the fact that the growth of population bordering upon the rivers, and the longevity of the typhoid bacillus emptying into it, or into the ocean where these oyster beds are located, wouldn't this increase have a tendency to spread
3828 into the directions where the oyster-beds are, as for example, take the Mississippi river with all its tributaries, entering in at the delta and spreading all over the southern part of Louisiana, Mississippi and Alabama, wouldn't that carry this contagion into the oyster beds in that part of the country, beyond the reach of local boards of health. Would you assume that would be the danger line in accordance with the views expresed by you in your testimony in regard to the longevity of the typhoid bacillus?

A. I think it is unquestionably true that the growth of population and the other conditions that you have referred to, do have a certain tendency in that direction, for it is generally admitted today that we have got to be extremely careful in the future and at the present in regard to this matter of oysters, but the growth of population and the additional amount of sewage entering the rivers and harbors, would not in my judgment produce any such sudden or marked increase in the typhoid fever of St. Louis, as has actually taken place.

Q. Assume, Professor, that in 1899, in November and December, that the number of reported cases in November in St. Louis was 480 and in December, I think it was 352 cases, for the year 1899, prior to the opening of the drainage canal, and for those two months in 1899 the number of reported cases in the city of St. Louis has never been equaled by any two sub-
3829 sequent months from 1899 up to the present, wouldn't it be reasonable to suppose that the increase in typhoid for 1900, was largely due to the cause that led to this epidemic in the months of November and December, thereby raising the number of deaths of 1900 from 130 in 1899 to 168 in 1900?

A. The difficulty with this question is as I have already stated. The number of reported cases is a very uncertain measure of the amount of typhoid fever in any city in which the reporting is not very well done, and we have evidence that this is a city of that kind. Therefore the question makes certain assumptions which I personally doubt the truth of. I do not mean that I doubt the material truth.

Q. Let me make an assumption in addition to the question. Assuming that in 1899 the Board of Health of St. Louis, sent out a letter requesting all physicians to return all cases of typhoid and a special effort was made to secure the data, and the same in 1900 and 1901

A. I am sorry to say that wouldn't materially modify my answer thus far, because physicians are notoriously not obedient to the Boards of Health which request them to do these things. Inasmuch therefore as the question makes assumptions which in my judgment are at least questionable, and probably, judging by the deaths, at variance with the facts, I am unwilling to draw any conclusions from those assumptions.

3830 Q. What additional facts that were included in this question do you have to state that the increase in 1893 resulted from an overreaching of 1892's epidemic, if you so stated?

A. I believe I did so state.

Q. (Question repeated).

A. It was not additional facts that I found out, but different facts. I had the deaths for the year and if I remember right, by months, and I ought to have in order to answer this question intelligently, the deaths by the months rather than the cases by months. However, I want to get at and tell the entire truth in this matter and all that I know and believe, and I may say frankly that I do believe that a part of the rise in 1900, was due to the same causes which operated at the end of 1899.

Q. That's what I was trying to get at.

A. Exactly.

Q. In a city the size of St. Louis, how many deaths from typhoid fever would there have to be to characterize the situation as epidemic?

A. That is almost an impossible question to answer. There is nothing more confusing than the terms "epidemic," "endemic," "outbreak" and the like, as applied to typhoid fever. In many cities and towns in which I have been investigating what I considered epidemics the local officials would try to 3831 hush up the use of that term, declaring that somebody would be scared away from the town, and they would refer to the thing as an out-break, or avoid calling it anything at all.

Q. My question applies to you as a sanitarian.

GENERAL CROW: He is answering it.

MR. TODD: If there is any reason that can be had.

A. And I should be unable to state any precise answer to your question. I should be unable to give a limit to the word "epidemic." In answering your last question or two, in which you use the term "epidemic" I hesitated to fall in with the question because of that use, but I thought that the word was so difficult to define anyway that it was not worth while to stick at that point. Now as a matter of fact it is questionable whether the amount of typhoid fever at the end of 1899, in a city of this size, and considering the season of the year, is entitled to be called an epidemic, but it was somewhat above the ordinary.

Q. Well, substitute for "epidemic" a "large increase." I am not captious about words.

A. Exactly, neither am I.

Q. I am after ideas.

A. We are a unit on that.

Q. In a city the size of St. Louis, would you regard an increase in the total number of deaths of fifteen or twenty 3832 as a large increase for the year?

A. That would depend upon the total mortality somewhat, assuming that mortality from typhoid in the sense you employ the term. If the total mortality were smaller than usual, or larger than usual, such a number of deaths might be excessive.

Q. (Qustion repeated).

A. Then, what is meant by large increase, is that it?

Q. Yes?

A. I should consider an increase such as I have actually found for the period since the drainage canal was opened, 73 per cent a large increase.

Q. If in 1900 you attributed a part of the mortality to conditions that existed in 1899, would you consider 38 death by typhoid in a city of the size of St. Louis a large increase?

A. Other things equal I should consider it a considerable increase because it means three or four hundred cases. It must be remembered that small things in typhoid fever count for a good deal, and a small increase may be indicative of a serious situation. The number of deaths from typhoid fever for instance in 1899 was 131, according to this (referring to board of health report) and that is not a large number of deaths from ty- good deal, and a small increase may be indicated of a serious phoid for a city of this size? If therefore, we have an increase the next year of 38 deaths, 38 is a pretty large percentage of 131,
and it seems to me that means a very serious state of
3833 affairs. We are dealing here with small numbers now.

Q. Suppose in 1890 there should be 277 deaths?

A. You mean 1900?

Q. 1890.

A. There were not, there were only 140.

Q. This chart has 277 deaths.

A. I don't know anything about that chart. Here is the table of the Board of Health.

Q. This has been introduced in evidence and marked Complainant's Exhibit No. 22.

A. In 1890, the number was not so very high according to this, 140. It must be a blunder on that chart according to the books. I go according to the report of the Board of Health.

Q. Assume, professor, that this chart is correct and there were 277 deaths in 1890. This chart has been verified and introduced in evidence by the City Bacteriologist of St. Louis.

GENERAL CROW: I beg your pardon; the city of St. Louis didn't have any bacteriologist. It was Dr. Ravold.

MR. TODD: Then by Dr Ravold.

GENERAL CROW: He wasn't city bacteriologist.

A. Everybody is subject to error. He probably made a mistake and got the wrong year.

3834 Q. But assuming that this is correct and that table there is a typographical or clerical error, because this has been sworn to and that has not. What would you attribute the high death rate in 1890 to?

A. I cannot answer that question. That would be a puzzler.

Q. What's that?

A. I don't believe I should be able to answer that question. I don't know. I would have to give it up.

Q. Do you know from what months those statistics are made up?

A. This (referring to board of health report).

Q. Yes.

A. No sir, I do not. They are published I believe by the Board of Health, and are such as I have usually in my studying.

Q. (Question repeated).

A. I will say that I cannot answer that question.

Q. If the total number of deaths in 1890 was 277 and the total number of deaths in 1891 was 160, and in 1892 was 488, caused by the sewer at Bissell's Point wouldn't you attribute the high death rate of 1890, to the cause of the high increase of 1892?

A. If I understand the question I think that I probably should, because if it had been found out that said water supply was contaminated from one of these sources in 1892, so
3835 much so as to make an epidemic, or as to have made an epidemic, I should be very much inclined to attribute a large number of deaths only two years before, to the same cause. That is, if I had found out unexpectedly a new and dangerous cause, I should expect to find that cause had probably been operating for the past two years, particularly if it was a clear case like that.

Q. Those causes operate to increase rather than reduce, do they not professor?

A. What causes?

Q. Of epidemics?

A. Sometimes to increase and sometimes to decrease.

Q. If the cause of the epidemic in 1890, wherein there were 277 deaths, was the same cause in 1892, wouldn't the increased number of typhoid cases in St. Louis in 1890, serve to contaminate the water supply more excessively, and thereby increase the number of deaths rather than reduce them in 1891?

A. I should expect that it would, yes.

Q. Then if the number of deaths in 1891 fell to 160 as against 277, in 1890, would you attribute the large number of deaths in 1890, to the cause which operated the epidemic in 1892?

A. I don't think I am quite clear on that.

Q. (Question repeated)?

A. Oh, I might or I might not. The causes of epidemics
3836 are intermittent oftentimes, and not continuous, and the
mere fact that the number had fallen between times would not be conclusive as to whether the same causes were or were not operative, but I cannot concede without further investigation, the assumption that there was an epidemic in 1890.

Q. I did not use the word "epidemic" for 1890 or for 1892.

A. I thought you did.

Q. I am wary of that word "epidemic." It was for 1890.

A. Well then I will put it in this way, but my own statistics show that there was no marked increase in 1890. 1890 and 1891 having had almost exactly the same amount of typhoid fever measured by mortality percentages and neither year being very different from the previous eight or ten years, so that all these assumptions and conclusions and deductions and inferences do not seem to me to have any value.

Q. Assuming that 277 for the year of 1890, is correct, and 160 deaths for 1891 is correct, as plotted on complainant's Exhibit No. 22, then what would you say?

A. In regard to?

Q. To the cause of the large increase in typhoid deaths in 1890?

A. From the conditions included, or rather from the facts
assumed and the conditions included, I should be unable to
3837 state because we have no knowledge of what had been
going on during 1890, and as I have already said, I think that assumption is probably contrary to the facts.

Q. Assuming that the assumption is in acordance with the facts?

A. Then I should still be unable to state.

Q. Then assuming that the assumption is in accordance with the facts of conditions in regard to deaths in 1890, the number of deaths in 1890 exceeded the number in 1900, 1901, 1902, didn't it?

A. On this exhibit it does.

Q. For each year?

A. For each year, yes sir. The annual number of deaths. But as I say, I am unwilling to accept this without further investigation because either there is a mistake in the reports of the Board of Health or else there is a mistake here.

Q. Do you consider an increase of 20 deaths in a city the size of St. Louis, which brings the total number of deaths up to 222, as being a normal increase in typhoid?

A. I must understand by normal increase that which would come from the growth of population alone, and in my judgment an increase of 20 deaths or about 200 cases in a city of this size would be abnormal and deplorable. Cities of the size and character of St. Louis should be diminishing their death rate rather than increasing it, and speaking generally all over the
3838 world they are doing so. Boston for example, with which I have compared St. Louis, has on the whole for many years been reducing its death rate, although there have been times when it has raised for a short period, the death rate from typhoid fever. I should therefore regard an increase of 20 deaths, under all the circumstances, as an abnormal and as I have said, a deplorable increase.

Q. Would you consider the mortality percentage on 10,601 cases, 198 deaths from typhoid fever, above the normal in a city the size of St. Louis?

A. I should, because that means 2000 cases, or rather very nearly 200 deaths to two thousand cases, and a mortality percentage higher than St. Louis has had at any time with the exception of 1892, 1893 and 1894,—since 1883, and also because it is very, much higher, in fact it is double the mortality percentage of New York and London, or very nearly so, as well as perhaps one-third higher than that of Boston at the same time.

Q. In a city of this size do you give any credit to the increase of typhoid fever which is contracted by citizens, outside of St. Louis and other places?

A. Certainly. That is one of the sources other than polluted water which I might have included in my list of flies, oysters, celery, milk and the like, and to that list I should

3839 like to add ice as one possibility, especially if it is made
from polluted water like that flowing in the Mississippi
river.

GENERAL CROW: Do you mean natural ice or artificial ice?

A. Either, it depends upon what the ice is made from. If it is made from Mississippi water and is not distilled or purified, it might be one element, although I believe a small element, in the production of typhoid fever. If it were natural ice cut on a polluted stream, I believe that might be one element, although a very small element, in the cause of typhoid fever.

Q. My question refers to people or citizens who have contracted the disease in other cities and other towns?

A. And die here?

Q. Yes, wouldn't that amount to quite a large percentage in this increase in death rate?

A. It would probably not amount to a large percentage of the increase, because people went away before 1900 and contracted typhoid fever very much as they do today. We may allow of course that there is more travel every year, but there is no sign of any such effect in New York City or London or Boston. St. Louis stands alone in that respect if that cause is the principal factor here. After a very careful consideration of all the circumstances and making due allowances for probable propor-
tion of persons dying in this way, coming and dying in the
3840 hospitals here and contracting the disease at summer re-
sorts and coming in and adding their name to the death
record, I see no reason to suppose that any unusual or extraordinary change has taken place since January 1st, 1900, and I may say further that I have taken some pains to inquire in regard to the hospital cases, and found no marked increase.

MR. JEFFRIES: Hospitals where?

A. The hospitals here in St. Louis.

WILLIAM T. SEDGWICK.

ADJOURNED until 10:00 A. M., Friday, May 22, 1903.

3841 Southern Hotel, St. Louis, Missouri. 10:00 A. M., Friday, May 22, 1903. Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

WILLIAM THOMPSON SEDGWICK,

resumed the stand for further cross-examination by Mr. Todd, and testified as follows:

Q. In addition to oysters conveying typhoid fever, you stated that celery might do so. In what manner, professor?

A. It is held by sanitarians that almost any form of uncooked food may under unusual circumstances, become a vehicle for typhoid fever. Among such uncooked foods celery and lettuce have often been mentioned, because these are sometimes manured with liquid or solid fertilizer which may have been contaminated with the infection of typhoid fever. As a matter of fact, however, there is no case on record in which it is clearly, quite clearly and satisfactorily established, so far as I am aware, that either of these vegetables has been the carrier of typhoid fever. I know of one case in which the evidence seemed
3842 tolerably clear in regard to celery, but this is the only case
with which I am familiar, and sanitarians generally do not allow any considerable importance to these or other vegetables as carriers of this particular disease. They rather look upon elements of this sort as going to make up that small amount of typhoid fever to which I have referred as the "normal" amount in civilized cities and towns, the word "normal" in this case being defined as I have already defined it, and perhaps rather unwisely used for a disease which ought not to exist at all in civilized communities. The true "normal" would be zero, for as someone has said, for every case of typhoid fever somebody ought to be hanged.

Q. In your last answer, professor, you gave what the views of sanitarians were, without mentioning who the sanitarians to whom you referred were. Do you adopt the views yourself which you have expressed as the views of sanitarians?

A. I ought perhaps to have said that these are my opinions, strongly held, and I believe are in entire accord with the general body of opinion of competent sanitarians generally and everywhere.

Q. In regard to the last expression in your previous answer; do you approve of that saying?

A. In the present state of civilization I consider it an extreme statement, because a great many cases of typhoid
3843 fever cases are caused by simple ignorance, and none, so far as I know, by malice.

Q. Do typhoid fever germs appear in the breath of patients?

A. I don't believe that they appear floating in the expired air, but if a patient should cough and a small particle of sputum should fly off in the breath, that particle might contain the germs of typhoid fever.

Q. Typhoid fever may be contracted from kissing, may it not?

A. It is held that it may be.

Q. Do you hold it?

A. Yes, I hold it.

Q. Are there any other ways by which typhoid may be contracted, than the ones which you have enumerated?

A. I have no doubt that there are.

Q. Are you acquainted with the number of wells in the city of St. Louis?

A. I have made some inquiries upon that subject.

Q. And what information have you been able to receive?

A. That there is a large number of wells.

Q. About how many?

A. I should have to refer to my notes, but my impression is at least two or three thousand.

Q. Do you know whether these wells are located in the neighborhood of outhouses?

3844 A. I don't know, but I have no doubt that some of them are.

Q. If the majority of these wells are located where there are privy vaults, and the inhabitants of the houses where these wells are situated use the water from those wells for drinking purposes, is there any way of estimating what effect those wells so situated, would have upon the typhoid increase in the city of St. Louis?

A. May I have that question please?

Q. (Question read).

A. I think there is.

Q. In what way, professor?

A. I think that any expert by a consideration of all the circumstances so far as he could learn them, and making careful inquiries as to changes in the custom of the people before and after a given time, would be in a position to say positively whether any such increase was due to any such cause—whether any considerable part of such increase, I will say even any inconsiderable part, was due to such cause.

Q. Do you know whether such a thorough investigation as you have indicated has been made of these wells for the years 1900, 1901 and 1902, in the city of St. Louis?

A. I think so.

Q. By whom?

3845 A. By myself. I have ascertained the number of wells. I have considered the question whether such number was materially changed before and after. I have used my general knowledge of American communities and their behavior in regard to wells and water supplies. I have taken into account the typhoid fever and the characteristics of the population as nearly as I could ascertain them by inquiry and observation, and I have come to the conclusion that there is no reason to suppose that any material change in the habits of the people in regard to the use of such wells or well waters since the time mentioned has occured, and that therefore that element may be entirely excluded as of consequence in causing any portion of the increase. I might even go further and say that as between wells taken in a general and large way, and including a certain number of polluted wells, and a city water supply, not above suspicion, it is by no means clear in my mind that the use of such wells would at any time increase the typhoid fever rate over and above the use of a water supply which was not entirely pure. I therefore exclude altogether the wells of the City of St. Louis as producing any important part of the increase in typhoid fever since January 1st, 1900.

Q. Do you consider that the information which you have is sufficient to establish your conclusions beyond all reasonable doubt?

3846 A. I do.

Q. How many wells in the city of St. Louis have you investigated personally, that privies drain into?

A. None.

Q. How many privies in the neighborhood of those wells, within these three years, have received the excreta of typhoid patients?

A. I don't know.

Q. How many people living in the houses where these wells are located and drinking the well water, have contracted typhoid fever from them if you know?

A. I have no means of knowing.

Q. And in the absence of knowledge upon those three propositions, do you claim as an expert sanitarian that your conclusions in answer to my former question were established beyond a reasonable doubt?

A. I do.

Q. I believe that you stated in one instance, of an epidemic that the same was caused from the excreta of one typhoid patient on the side of a hill. If a typhoid patient or several should discharge their urine and feces in a privy vault adjacent to a well in the City of St. Louis, and the people should drink the water from the well, is it possible for the water of the well to be contaminated by the infected fecal and urine discharge from
3847 the typhoid patients?

A. That depends altogether upon circumstanmes. If the material of the earth through which those infectious materials must pass, be of the right sort for purification *en route;* or if they be impervious to the passage of such materials; then no infection would arrive in the well. If on the other hand, cracks or fissures existed so that there was a free communication between well and privy, it is possible that typhoid fever might arise as suggested. The well water theory, however, has in my judgment been seriously overworked, and I am on record in my book entitled "The Principles of Sanitary Science and the Public Health," as stating that in my judgment the public belief in the dangers of well waters has been greatly exaggerated. In my epidemiological experience, which is now quite extensive, I but very seldom have had occassion to attribute to infected wells epidemics of typhoid fever. I may say that I have never seen an epidemic of any size derived from such source. The most famous epidemic on record in which a contaminated well was the cause of the trouble, was that at Caterham, in 1879, when the dejecta of one workman digging in a well, from which the water went quickly to the people, did apparently cause a serious and extensive epidemic, but the well water theory is in my opinion,—in the popular form of it at least,—based largely upon insufficient evidence.

3848 I know from my experiments for the State Board of Health of Massachusetts upon the purifying power of earthy materials, that as a rule the passage of infectious materials through open soil, removes all traces of infection. If the soil is not open; if it is impervious, obviously nothing can pass. The only cases in my judgment, in which privies are dangerous to wells, are those in which the soil is either very open, or cracked or fissured in some way.

In view of all these facts, and further, in view of the fact that no material or essential change, so far as I can discover, has taken place in the habits of the people of St. Louis since January 1st, 1900, I should exclude altogether the wells as any element in the increase which has taken place since that time. They may have contributed to keep up the usual amount of typhoid fever in St. Louis. No doubt a few of them have, but to look to them as in any sense, or in any degree, a reasonable explanation or a reasonable source of the increase,—the large increase,—of typhoid fever, the steady and continued increase since January 1st, 1900, would in my judgment, be a serious blunder.

MR. TODD: Just read my question.

(Question read).

MR. TODD: I move to strike out all of the answer that is not responsive to my question.

3849 GENERAL CROW: Complainant submits that the answer is entirely and directly responsive to the question asked by the gentleman, and answered in a manner exactly as the witness has a right to answer.

MR. TODD: If conditions existed in any of the wells of St. Louis where fissures appeared, permitting the contamination of privies to enter the wells, such as you have indicated in part of your answer, have you investigated to ascertain whether that condition obtains or not?

A. I have not.

Q. If that condition should obtain, would you say then as a sanitarian, that the water of that well would not spread the contagion of typhoid?

A. Am I to understand that you assume a typhoid infected privy near a fissure, or communicating with fissures leading to a well?

Q. Yes.

A. That in my opinion would be a serious menace to the health of the people drinking that water.

Q. Do you know whether in the three thousand wells or more in the City of St. Louis, that condition obtains in one or more wells?

A. I do not.

Q. Can that fact be ascertained in any way except a personal investigation of all the wells?

3850 A. It cannot even be ascertained in that way, for it would require the taking up of the earth about every well and in the process of digging, fissures might be filled up by the workmen, which fissures had previously existed. It is an impractical proposition, and the facts are, in my judgment, beyond the power of human discovery, broadly speaking. It might of course in some cases be found, but a personal inspection alone would probably not disclose it in a single instance, unless by some rare good fortune.

Q. If the theory of well contamination has been overworked, would you as a sanitarian, permit wells to be built in the neighborhood of privies, the waters of which wells are used for drinking purposes?

A. I should certainly not recommend such procedure, because while safety may, and in my judgment does, ordinarily follow it, the water of said wells would almost inevitably contain a more or less purified sewage, and for mere aesthetic reasons quite apart from all dangers of infection, I should not recommend such a course; and moreover, one can never know when a fissure may be formed or under what circumstances it

may have originally existed, so that while I believe, as I have said, that the well water theory of the causation of typhoid fever has been unduly pressed, I do not believe that well
3851 waters are entirely free from either suspicion or danger.

Q. You do admit, do you not, professor, that conditions may exist *whereby the water of a well may be contaminated, as* well as infected?

A. Certainly, sir.

Q. If that condition should exist in St. Louis, and there can be no evidence, or practically so, to disprove that assumption, and water from that well should be drunk by people visiting the household where such a condition exists, notwithstanding the fact that the parties or party who drank the water at this house, also drank the water from the water supply of the City of St. Louis, and contracted typhoid fever; is there any way known to science to prove from which cause the typhoid fever was contracted,—the well water, or the drinking water from the St. Louis water supply,—during the years 1900, 1901 and 1902?

A. Not by an examination of the patient alone; but under certain circumstances, it might be possible to establish it with a high degree of probability. If, for instance, at the time when the patient contracted the disease, as shown by the subsequent history of typhoid fever in St. Louis, few people were coming down with that disease throughout the city at large; and, further, if it could be shown that at that same time there was an outbreak of typhoid fever among persons regularly or ordinarily using the water of that well, then an
3852 epidemiologist would be justified in concluding that the patient had probably contracted the disease from the well water, and not from the city water. In the absence of some such evidence as this, however, it would be impossible to tell, as it often is in single or sporadic cases of typhoid fever, exactly where the patient contracted the disease.

Q. Suppose that there should be a number of such wells answering like conditions as are pre-supposed in the former questions, and during the year 1900, in the City of St. Louis there should be 1213 cases of typhoid; 1901, 1101 cases of typhoid, and 1902, 1112 cases of typhoid; then with like conditions prevailing at each of the places where a number of wells are located, such as is assumed in the previous questions, would it be possible for you, in the absence of a personal investigation of the water of these wells, to ascertain whether these cases of typhoid fever for these different years as I have numbered them, came *from these wells*, or a *large* part of them, came from the wells, or from the drinking water of St. Louis, or from other causes?

GENERAL CROW: Read that question.

THE WITNESS: Perhaps we had better have the previous question read.

MR. TODD: Read the previous question.

(Two previous questions and answers read.)

3853 A. Now, what do "these cases" refer to, to the total?

Q. These cases for the three years before mentioned.

A. It depends upon what you mean by personal investigaiton. If by that term you mean that I must go personally and endeavor to seek out such limited outbreaks and discover whether they form a large part of the total number of cases, then I do not consider it necessary. If on the other hand you mean merely to ask would it be necessary for me to take into consideration the possibility that such local outbreaks have occurred, or that in my studies of the vital statistics of St. Louis I should make inquiries of competent persons, familiar with local conditions, sufficient to satisfy myself in regard to the actual facts so far as known, then I may say that I do regard it as necessary, and as a matter of fact I have in my studies, taken into consideration precisely such conditions. I have satisfied myself as an expert, by careful inquiries, and by a study of the local conditions, that no serious or numerous outbreaks of this kind have occurred, or any which would justify me in coming to any different conclusion to that which I have come, namely that wells—polluted and infected wells—as an appreciable factor of the increased typhoid fever mortality in St. Louis, must be excluded.

Q. By personal investigation I mean such an investigation made by yourself or some competent, reliable person who
3854 is able by competent evidence to establish the existence or non-existence of the facts assumed in the hypothetical

questions put to you. With that definition, have you in that manner satisfied yourself as an expert, of existing conditions in regard to wells?

A. Just read that question and also the previous question.

(Two previous questions read.)

A. I have.

Q. I believe you stated that you made no personal investigation?

A. I made no personal investigation of individual wells.

Q. In St. Louis?

A. In St. Louis.

Q. From what person or persons who have investigated the conditions of these 3,000 wells in the City of St. Louis and have submitted the results of their investigation to you, that you have been able to be satisfied of the actual conditions of those wells, as they existed during the last three years?

A. I have not satisfied myself in that particular way, but in a different way. I have examined the approximate location of the places of death of persons dying of typhoid fever in St. Louis and from my general knowledge of typhoid fever outbreaks, based upon experience and my general training as 3855 an expert, I have satisfied myself conclusively that no such outbreaks have in fact happened during the period mentioned, of such magnitude as to make any perceptible impression upon the increased death rate in St. Louis during the years mentioned.

GENERAL CROW: I beg your pardon. Do you mean death rate generally, or death rate of typhoid fever?

A. Death rate by typhoid fever, of course.

Q. MR. TODD: What locations or approximate locations of places of death or persons dying of typhoid fever in the City of St. Louis have you investigated and give the location of those localities?

A. I have investigated the distribution of the deaths by years, by months and by districts throughout the city and I find that the characteristics of typhoid fever in St. Louis are precisely such as might be expected and have in fact been experienced in epidemics—the causation of epidemics or other appearances of typhoid fever,—due to an infected water supply. In

the rare instances in which epidemics or outbreaks have been traced to wells, the deaths are numerous within a short time, bunched together, so to speak, both in time and in space. I find nothing of this kind in the City of St. Louis during the years mentioned, which would lead me in any degree to modify
3856 the opinions already expressed as to the source of the increase of typhoid fever.

GENERAL CROW: Allow me to suggest that instead of the years mentioned, that you interpolate into that answer, the precise years.

MR. TODD: It is understood that you mean the years 1900, 1901 and 1902..

A. It is understood that the years mentioned are the years 1900, 1901 and 1902.

Q. What districts throughout the city have you investigated for typhoid fever?

A. The so-called sanitary districts.

Q. How are they designated?

A. By numbers.

Q. Can you give the numbers?

A. I can. There are seven.

Q. Are those seven districts co-extensive with the city limits of St. Louis or are there other districts in St. Louis aside from those seven?

A. I shall have to get a map for that. (After referring to map). They cover the city of St. Louis for sanitary purposes, and form the basis of the statistics which have been so often referred to.

Q. Do you know, Professor, whether the city of St. Louis is divided up into sanitary districts?

3857 A. I understand that it is.

Q. And how many sanitary districts are in the city of St. Louis?

A. Do you mean in the legal city,—in the municipality?

Q. Yes?

A. I don't know, but I supposed that the seven districts were co-extensive with the city boundaries, but whether they are or not, they are the districts upon which the statistics have been founded all through, and they are practically at least, taken together, the same thing as the city of St. Louis.

Q. That is, that the statistics of typhoid cases, and deaths, —especially the deaths that have been talked about here in evidence, are compiled from these seven districts?

A. That is the case.

Q. Have you investigated all those seven districts?

A. I have.

Q. How are those districts designated, by numerals or by some other means?

GENERAL CROW: He has already said they are numbered.

THE WITNESS: Yes sir.

Q. Take district No. 1, how many wells are located in District No. 1?

A. I have that information, on another paper which I do not seem to have here. If it is important I can send down 3858 and get that; it is downstairs.

Q. Yes, I would like to have it.

A. (Witness procures papers referred to). Of course I cannot undertake to say precisely, but the number I have today is 492.

Q. District No. 2?

A. 1073.

Q. District No. 3?

A. 101.

Q. District No. 4?

A. 1058.

Q. District No. 5?

A. 300

Q. District No. 6?

A. 311.

Q. And District No. 7?

A. 1877.

Q. How many deaths from typhoid fever were in district No. 1?

GENERAL CROW: What year?

MR. TODD: For the year 1900, if you have the figures.

A. I cannot of course guarantee the absolute correctness of these, but these were compiled from the official records by officials, and as I have them here, there were 19. This is for the year 1900; you asked for 1900?

Q. Yes, 1900?

3859 A. 19.

Q. And 1901?

A. Same number.

Q. And 1902?

A. 26.

Q. District No. 2—1900?

A. 14.

Q. For 1901?

A. 1901 for the second district, 27.

Q. And 1902?

A. 21.

Q. District No. 3?

A. 28 for 1900; 30 for 1901 and 36 for 1902.

Q. No 4?

A. 24 for 1900, 27 for 1901; 34 for 1902.

Q. No. 5?

A. 18 for 1900; 18 for 1901; 23 for 1902.

Q. No. 6?

A. 42 for 1900, 46 for 1901; 57 for 1902.

Q. No 7?

A. 23 for 1900, 30 for 1901; 25 for 1902.

3860 Q. Now as to the physical conditions and sanitary conditions in these wells, in any of these districts, has anyone reported to you an investigation to ascertain their physical and sanitary conditions?

A. No.

Q. Assuming that in these different districts where the typhoid was high in comparison with the other districts, that there existed a number of infected wells, wouldn't that condition account for the typhoid in the city of St. Louis?

GENERAL CROW: For what period of time?

MR. TODD: For 1900, 1901 and 1902.

A. It might, if one were justified in making such an assumption and excluding from the same assumption the possibility of the occurrence of infected wells in other districts. Any such assumption unless it covers the whole city, is a gratuitous one, and such wells are no more likely to occur in one place than in another. Besides there is in no case in these districts any such excess as would lead to the expectation or to the supposition that any such infected wells had existed and inasmuch therefore, as the assumption is so to speak, entirely in the air, and does not include all the conditions which any assumption of this kind must include, I do not think that the larger numbers of typhoid deaths in certain districts can reasonably be accounted for in this way.

3861 Q. But assume that an infected well exists out of this great number of wells in the city of St. Louis, in the absence of any personal investigation of all these wells by a man competent to pass upon their sanitary condition, you wouldn't consider as a gratuitous assumption, would you?

A. Repeat the question.

Q. (Question repeated)?

A. No sir.

Q. If such a well should exist and be connected with a dairy where the water from the well was used in diluting milk, could not that spread the disease of typhoid throughout the city if the milk was delivered to different houses and consumed by the people?

A. If the route of the dairyman covered the whole city or any considerable part of it, and the conditions were as you have stated, it is possible that an infection might be spread from such a source; but any milk epidemic produced in this fashion if of appreciable size, is usually easy to discover and there are none of the ear marks of any such epidemic so far as I have been able to discover, about the typhoid fever deaths in the City of St. Louis during the years 1900, 1901 and 1902.

Q. Do you use the word "epidemic" in the sense that you defined it yesterday as applicable to conditions existing
3862 in St. Louis during 1900, 1901 and 1902?

A. I do not remember exactly how I used it yesterday.

Q. You gave a definition of an epidemic in connection with a question that I used in which I employed the term.

A. I was under the impression that I rather avoided defining the word "epidemic" for, as I then stated, it is a debatable term. The word means "upon the people," and I believe that the typhoid fever in St. Louis during this period, during the years 1900, 1901 and 1902, would justify the use of that expression. At the same time I like to reserve the use of the term rather for such violent and brief explosions of the disease as occurred, for example, in St. Louis in 1892 and in Chicago in 1891. At the same time I should not hesitate to employ this term for the entire three years of the period mentioned, especially as the disease has been gradually increasing during that time and it may hereafter appear that worse conditions are to follow. I have, however, in my direct testimony, and I think nearly always, referred to the condition as an increase of 73 per cent. rather than an epidemic; and for the reasons mentioned.

Q. If the wells in St. Louis were typhoid contaminated to a sufficient extent to account for the increase of typhoid, how would it be possible to ascertain and demonstrate that fact, Professor?

A. I think that would be a comparatively easy matter. 3863 For in that case, inasmuch as it is absolutely inconceivable from a sanitary standpoint, that any very large number of wells should be so infected, the vital statistics must then show a large number of cases and deaths in restricted or special localities, a much larger number than have hitherto occurred in such localities, and so localized in time as to pass like a wave over even the locality in question. I believe that any competent epidemiologist would readily discover such a condition if it existed, by its results.

Q. Assuming that a household consisting of a family, had a visitor from some other city who had the typhoid fever, contracted elsewhere than in St. Louis, and the discharge of this person found its way into a well, and that the water in that well became typhoid infected, and assume that the water supply to that family should suddenly be cut off, and the question for decision would be, is that water usable. Is there any way known to science whereby it could be decided whether that water was usable or not?

A. For drinking purposes?

MR. TODD: Yes, sir.

Q. (Question repeated.) Aside from the knowledge contained in the assumption that it was infected?

A. Not with absolute certainty.

Q. What do you mean by absolute certainty, Professor,
3864 in the answer to the preceding question?

A. I mean not with accuracy. One might by chemical and bacteriological analyses gain a good deal of information. He might arrive at a high degree of probability, but our methods of chemistry and bacteriology are not so perfect but that there would remain a possibility that something had been overlooked, something had escaped observation. Samples would have to be taken as the whole well cannot be examined. One would have to take what we call for lack of a better word, a "typical" sample, but there again we have only approximate information. No sample can be absolutely typical of all parts of anything when that thing is made up of heterogeneous material. We, however, analyze these samples by processes which are open to human fallibility and which are at best only approximate, so that although we may arrive at a high degree of probability and might believe that the water was usable for drinking purposes, I cannot as a sanitarian, state that the water would be or is absolutely and indubitably free from any possibility of infection; and as long as I could not state that,—under the assumption of a previous infection, a known infection,—I should be unable to arrive at what I call an absolute certainty.

Q. Then the only proof of the infection of that water would be its effect upon the people using it, wouldn't it?

3865 A. If one obtained a positive result,—if he were fortunate enough to discover the typhoid bacillus, or a large number of colon bacilli, or other organisms characteristic of polluted water, he would have some evidence of its unfitness. If, however, chemical analysis revealed similar evidences of pollution, which might possibly be accompanied by infection, then such positive results would not require the occurrence of disease in the person using the water in order to answer the question and enable an expert to come to an opinion; but in the absence of such results, at the other end of the scale, if one found the analyses fairly satisfactory, or even very satisfactory, chemically and biologically, there would still remain an element of doubt which would prevent the expert from affirming an absolute certainty.

Q. Has the germ of typhoid ever been found in running water?

A. That is a disputed question. Some bacteriologists think that they have discovered it in running waters. Others feel that while they may have discovered something very closely related to it, yet that they have not sufficiently established the fact that they did discover the real germ of typhoid fever, so that I am unable to answer that question point-blank, with "Yes" or "No." I have never discovered it in running water, and although one of my assistants at one time, thought that he
3866 had discovered it in the tap water of a city, which water
was sewage polluted, that was a number of years ago when our methods were not as keen as they are today, and I have never felt entirely satisfied that he had the real and only germ of typhoid fever. The matter is a very difficult one at best, but at the same time some observers, especially some foreign observers, do believe that they have discovered the typhoid bacillus in running waters, and if I am not mistaken, in the sediment deposited from sewage polluted waters, and it is possible that they are right. I do not wish to set my opinion against theirs. I simply state my own, the fact that I have never found it, and that it has been found very rarely, if ever.

Q. If the well should be typhoid polluted, does that mean that the water in that well is capable, if taken into the human system, of causing typhoid, that water or parts of it?

A. That also is a very difficult question to answer. If the infection is sufficiently extensive, or if the well is small in proportion to the amount of infection,—which would come to the same thing; if, furthermore, time be given for agitation or distribution by the ordinary processes of diffusion in quiet bodies of water, or if the well be stirred up by pumping or by a bucket, or fish, such as are often kept in a well in the country,—and the stirring up of the sediment by fishes must always be borne in mind in a sewage polluted stream, and the possi-
3867 bility of a return of the infection to the supernatant water
by such agitation of sediments which have become partially typhoid infected; then it is possible that a very considerable portion of the water,—I don't mean every atom or every mollicule, but every glass or pitcher-full of the water, if you choose,—may become infected, and certainly no one would be rash enough to say that the typhoid pollution or infection of

a well will leave any part of it safe to drink, until such infection has been effectually removed.

Q. But you can conceive of conditions where people drinking of that well, some of them would be affected with typhoid and others not?

A. That, sir, is the ordinary experience in all kinds of epidemics. There we have to bring in the matter of vital resistance. Out of 50 people drinking water from an infected source, from a public supply or well, or taking milk or celery or any other infected food material, some may be immune by virtue of previous attacks of typhoid fever, and some may be in such buoyant or robust health as to be able to deal successfully with the infectious material, so that it is a common experience to find, it is a universal experience to find, that only a portion of the persons exposed to infection do actually succumb to the disease.
3868 I look upon it somewhat in the manner of a battle. A regiment may be exposed to a similar fire, but not every man is hit, and some are hit worse than others.

Q. If it is impossible, chemically and bacterially to ascertain whether a well is typhoid infected or not and everybody using this water is not susceptible to being infected by the water, and the possibility or probability that some of these wells in St. Louis, or a great number of them are infected, could not the typhoid condition in St. Louis for the last three years, in excess of what you have denominated a normal condition, from celery, oysters and matters of that character be attributable to those wells?

A. Decidedly not, because there is absolutely no reason to the best of my knowledge and belief, to suppose that any different condition prevails on the whole in the wells of the City of St. Louis since January 1st, 1900, to that which had prevailed there for years before, and I should regard it as absolutely impossible and absurd to attribute the excess of typhoid fever which has appeared in St. Louis since January 1st, 1900, to any such source.

Q. In examining the statistics of typhoid offered here in evidence, I find in the city of Lincoln, Nebraska, for the year 1900, 4 deaths.

1901, 13 deaths,
3869 1902, 2 deaths.

In the city of Kansas City, for 1900, 49 deaths,
1901 58 deaths,
1902, 58 deaths.

In Quincy, Illinois, for 1900, 10 deaths.
1901, 14 deaths,
1902, 17 deaths,

In the City of Des Moines, Iowa, for 1900, 7 deaths,
1901, 22 deaths,
1902, 21 deaths.

In the City of Minneapolis for 1900, 13 deaths,
1901, 121 deaths,
1902, 66 deaths.

In those different cities which I have mentioned, the deaths from typhoid fever indicate a gradual rise from 1900 to 1901, to 1902, with few exceptions. From your investigation and consideration of the typhoid fever in these different locations, have you any opinion to express as to what is the cause of this apparent increase for these years, in these different cities?

MR. JEFFRIES: I object to the question because it doesn't call the witness' attention to the falling off of the cases in other cities during the same period on the same watershed.

GENERAL CROW: I object to the question on the fur-
3870 ther ground that the increase in the cities named is wholly immaterial in this case.

MR. TODD: In explanation of Attorney-General Crow's objection, I will state that in view of the fact that the witness has expressed an opinion as to the cause of the increase of the typhoid in St. Louis, as a sanitarian, I ask these questions to see how extensive his knowledge is upon questions of a like character arising in other places.

GENERAL CROW: In reply to the explanation of the objection by respondent's counsel, complainant states that the asking of the witness' opinion as to typhoid epidemics in other places, certainly cannot test the accuracy of his opinion in this case, for the reason that counsel for respondent has by a long and continuous, not to say wearying cross-examination, tested fully the knowledge of the witness as to the condition of affairs in St. Louis.

MR. JEFFRIES: And I object to the question further for the reason that the witness is not informed in the assumption or in the question the distance or number of miles that the respective cities are located from St. Louis?

MR. TODD: In reply to that objection I submit that in the longest hypothetical question in the record propounded by Mr. Jeffries all these distances were assumed and have been given
to the witness, and I do not care to incumber the record by
3871 repeating what is already supposed to be in evidence.

A. Having made no investigations of the sanitary conditions and causes of the typhoid fever in any of the cities mentioned, I am unable to give any reason for the facts stated. I may, however, say that in the case of Minneapolis, the large number of deaths in 1901, namely 121, must obviously have been due to some special epidemic inasmuch as the deaths in 1900 were only 13 and fell off in 1902 to 66. Here we see no such steady rise as is found in St. Louis, and the remarkable condition of 1901 appears to have been temporary and passing, while that of St. Louis appears to be thus far at least, permanent, and steadily growing worse.

In the case of Des Moines, Iowa, the numbers given are not materially different from the number of deaths in the immediately preceding years, and in my judgment do not constitute any such remarkable difference from the years preceding, as do the deaths in St. Louis since 1900 compared with those during the five years immediately preceding. I may make the same statement in regard to Lincoln, Nebraska, where, although the number of deaths in 1900 was only four, it is obvious from a comparison of this number, with those which occurred in the years immediately before and afterwards that the typhoid fever mortality in those particular years was unusually low and the rise which came from this abnormally low period to the two following years made the number of deaths in those years
3872 only about the same as in the previous three years, a condition of things totally different to that in St. Louis.

In the case of Kansas City, so far as I have the figures before me, there has been some rise, and I am unable to account for this without having made any investigation. It is apparently not very large and may be due simply to the rapid increase in population.

Adjourned until 2:00 p. m., Friday, May 22, 1903.

3873 Southern Hotel, St. Louis, Missouri. 2:00 p. m., Friday, May 22nd, 1903. Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

WILLIAM THOMPSON SEDGWICK, resumed the stand for further cross-examination, by Mr. Todd, and testified as follows:

THE WITNESS: If you will read my answer (just before adjournment) I think I said that the same state of facts applied to Quincy.

(Answer read.)

THE WITNESS: That is all right.

MR. TODD: Professor, in the hypothetical question put to you by Mr. Jeffries, and the tabulation of typhoids from each of the cities located on the water-shed of the Missouri, Mississippi and Illinois river, exclusive of the sanitary district of Chicago, would you regard the excreta of the typhoids that appeared in each one of those several cities, if emptied into the river, upon which those cities are located, alone sufficient to make unsafe, the water supply of St. Louis? By that I
3874 mean any one city as distinct from all the cities?

A. I should certainly regard the rapid and practically continuous pouring of typhoid excreta from such a number of cases as appears to have occurred in any of these cities, as contributing to make the water supply of the city of St. Louis unsafe; but inasmuch as this is purely a theoretical question, and as a matter of fact such a condition does not, and in the nature of the case, cannot exist; and furthermore, keeping in mind the partial purification of the water supply of St. Louis after it has been taken from the river at the chain of rocks; I cannot say whether I should or should not under real conditions, so regard the water.

Q. Assume that in 1897 the total number of deaths from typhoid fever as tabulated in the hypothetical question put to

you by Mr. Jeffries, for the cities lying along the water-sheds of the Missouri, Mississippi and Illinois Rivers, were 374, and for 1898 were 375, and for 1899 were 387, and that the excreta from these typhoids which have been tabulated as the ones who died, as well as those who survived, entered the different tributaries,—the different rivers above the St. Louis Intake, would the excreta of this number of typhoids, including those who died as well as those who survived, be sufficient to render unsafe and dangerous the water supply of St. Louis for those three
3875 years, as it comes into the intake tower?

A. I have no doubt that the number of typhoid fever deaths and cases existing during the three years mentioned, upon the water-shed above the intake of the St. Louis waterworks, which numbers would indicate perhaps between three and four thousand cases, annually, would render the water supply of the City of St. Louis, if taken at the chain of rocks and delivered to the citizens, unpurified, somewhat unsafe and somewhat dangerous, but it must be borne in mind that many of these deaths occurred at very remote points. It must be remembered furthermore that at no one time was there anything like any such number of cases as three or four thousand, and that for some periods the number of cases and deaths upon this immense watershed must have been comparatively very small, so that there may have easily been times during those years, or any one of them, when the water was neither unsafe nor dangerous. Putting all the facts together, then I should say that inasmuch as at no time was there any very large number of cases or deaths upon the said water-shed, exclusive of the sanitary district of Chicago, so far as I am aware, and inasmuch further, as the water taken from the intake tower at the chain of rocks was considerably purified by sedimentation before its delivery to the people of the city, the danger at any one time could not have been very great. In point of fact the statistics show
3876 that during those years typhoid fever in St. Louis was, for St. Louis, remarkably low, and the water probably better than for many years previous, excepting the years 1895 and 1896, when the conditions of the intake were similar to those which prevailed during the three years under consideration.

Please read that answer.

(Answer read).

MR. TODD: Is that your answer, Professor?

A. Yes sir.

Q. What element in this question involved anything connected with the sanitary district of Chicago?

GENERAL CROW: I object to that for the reason that it is wholly immaterial as to whether or not the witness can so interpret the question of counsel as to make it relevant to the defense of the respondents in this case.

MR. TODD: Read the question.

(Question read).

GENERAL CROW: You refer now, Mr. Todd to your question?

MR. TODD: To my question, yes.

A. I am not sure that any element in the question required reference to the Sanitary District of Chicago. My only idea in referring to it was to make it perfectly clear to which part of the watershed I referred in my answer.

3877 Q. The data from which these summaries for 1898, 1899 and 1900 are made,—have you had an opportunity to look over them?

A. I have; most of them at any rate.

Q. From that data is it not a fact that there was typhoid fever in some of these places during nearly every month of the year?

A. I think it is, in a general way, yes.

Q. Do you hold as a sanitarian that where the excreta of persons suffering from typhoid is thrown into a running stream that cities below, located upon that stream below the place where the excreta was received, and taking their water supply from the stream, that that water supply is not unsafe and dangerous, whether the distance is 50 miles or 800 miles?

A. Will you read the question?

Q. (Question repeated).

A. As I have already repeatedly said, it is not after all so much a matter of distance, as to time, and speaking broadly, I do hold that the pouring in of raw sewage materials into a drinking water stream, is likely to render the water below unsafe for drinking purposes. There may be however times when such water could be used with safety, owing to the so-called self-purification en route, by dilution, sedimentation and the time-factor. The trouble is that no one never knows when such factors shall have had their perfect work. Days or weeks may go by when the water may be consumed without danger, 3878 and then owing to a change of conditions or circumstances, such as a stirring of the sediment or a quickening of the flow, a stream that was previously safe for a while may become a source of the greatest danger for an uncertain period.

Q. Assume, Professor, that you occupied the position in St. Louis as a sanitary engineer, and you were acquainted with all the conditions in regard to typhoid for the years 1897, 1898, and 1899 on the watershed, as have been proven here in evidence, and as have been included in the different hypothetical questions, both the one put to you by Mr. Jeffries, and the ones that I have presented to you; would you be able, from your experience as a sanitarian, as well as a scientific man, to state what times under conditions existing in St. Louis, as they did during those three years, in regard to its water supply, when it would be safe for the citizens to use the water that comes from the intake and when it would not be safe, as explained in your previous answer?

A. Just read that question.

Q. (Question repeated).

A. No, I should not be able to state the times when it would or would not be safe under the conditions assumed.

Q. That being the case, would you as a sanitarian, recommend to the citizens of St. Louis to use that water at any time during those periods, and recommend the same as being 3879 a safe drinking water?

GENERAL CROW: Complainant objects for the reason that it is wholly immaterial to any issue in this case as to what the witness might have recommended under the assumed conditions, because complainant was and is entitled to the use of the waters of the Mississippi river on the Missouri side, for drinking and all primary and domestic purposes, free from pollution by the Sanitary District of Chicago or any one else, and the question as to whether the water supply of St. Louis is such as would be recommended by a sanitarian as reasonably safe for use prior to the 17th of January, 1900, is wholly immaterial in this case.

Q. (Question read).

A. I should probably not have recommended it for drinking purposes, or as a safe drinking water at any time during that period without treatment and purification, inasmuch as one would never know—could never know, assuming that typhoid bacilli once found access to the river above in these large numbers—could never know with any precision or certainty that these would have been effectually removed. Especially is this true with a water-shed of this character, upon which a rain, limited as to the area upon which it falls, might seriously affect the problem and inasmuch further, as the stirring of sediments
3880 by steamers or by fishermen might at any time
convert what would otherwise be a well purified, flowing stream, into one laden with danger.

Q. Professor, do you know whether the Health Department of the City of St. Louis has ever examined any of the wells located in the city of St. Louis, for the purposes of ascertaining their sanitary condition?

A. I do not know, but even if they had I should not feel certain as to the results of such examination, because in the present state of the art, as I stated this morning, it is often impossible to tell by ordinary methods of examination whether a well is or is not safe for drinking purposes.

Q. In the hypothetical question put to you by Mr. Jeffries, in which no facts in regard to typhoid were assumed for the city of Alton, between Grafton and the St. Louis intake, if the facts should disclose a considerable amount of typhoid fever at Alton would that fact have any effect upon the answer that you gave?

A. May I ask what year?

Q. For the periods included in the question.

MR. JEFFRIES: Included in what question?

MR. TODD: Mr. Jeffries' question?

A. Now read that again.

Q. (Question read).

A. It might, although Alton is on the other side of the river, and considerably nearer St. Louis than the mouth 3881 of the Illinois, but as a matter of fact this question is purely hypothetical because no such facts can be disclosed. I have myself visited Alton in order to make good the blank in our record which unfortunately existed, and in order to avoid any possible blunder in this direction and I not only found no such excess, but every indication of a low death rate from typhoid fever.

Q. What did you find at Alton, Professor, in regard to typhoid?

A. I found that for the year 1903 thus far, there had been only three deaths, I think it was, from typhoid fever, in a city of 15,000 people, as recorded by the city clerk. For the year 1901 there was no record at all; for the year 1900, no record at all, and having been informed by the newly appointed City Clerk that I should get all the facts, if there were any, at Edwardsville, I took pains to visit Edwardsville and myself examined the county records but found nothing material in addition to what I had already discovered, or failed to discover, in Alton. The fact is, the Alton records are miserable in the extreme from any standpoint of sanitary science,—or were previous to January 1st, 1902, for a number of years. One of the ridiculous things that came out was that in the year 1900, I think it was, in a city of 15,000 people, only three persons had died from all 3882 causes,—a state of affairs which shows the absolute worthlessness of the records. It is perhaps the most remarkable death rate that I ever heard of.

Q. Professor, if the excreta of typhoid fever should be placed in a privy vault, how long would it have to remain there before it would lose its infection?

A. No man knows.

Q. It might be days, weeks or years, might it not?

A. I believe so.

Q. Do you believe in the theory of what is known as septic tanks?

A. I believe in a septic tank, but I know of no one "theory" of that tank.

Q. Would a privy vault operate as a septic tank for the purification and destruction of pathogenic germs?

A. Ordinarily a privy vault does not closely resemble a septic tank because it is a mass of tolerably solid material, while a septic tank is essentially standing or stagnant sewage. That is to say something very much more dilute. At the same time, some privy vaults are undoubtedly septic tanks, but as to septic tanks, while I believe that pathogenic germs are relatively quickly destroyed, we are not yet in possession of sufficient evidence to enable us to speak with entire precision
3883 on that head. I do believe that under some circumstances the typhoid excreta in a septic privy vault might be disinfected and under slightly different conditions, might not; but the ordinary privy vault is not in my judgment, a good septic tank.

Q. And if the contents of such a vault should be placed where the same should get into a stream it would contaminate that stream both by way of pollution and infection, would it not, if the contents came from typhoid patients?

A. Read that please.

Q. (Question read).

A. It would, unless as stated in the previous question, the pathogenic germs might have died out.

Q. When you made your investigations in regard to typhoid in the city of Chicago, was that investigation made under the authority or by the direction of anybody?

A. No.

Q. It was an individual investigation?

A. A labor of love,—purely a labor of love. I was informed that typhoid fever was excessive in amount in the city of Chicago not long before the opening of the World's Fair, and realizing what it meant to the whole country, not to mention visitors from other countries, to have Chicago in the midst of so great a typhoid epidemic as that from which it was then suffering, I deemed it my duty to collect the facts and publish them.

3884 Q. In your investigations, to what did you attribute the conditions of typhoid in the City of Chicago?

GENERAL CROW: Have you got that report, professor?

A. Yes.

GENERAL CROW: You might refresh your memory?

A. Chiefly to the pollution and infection of the water supply, although of course, the usual factors of secondary infection, milk and the like, were also considered. We,—for Mr. Allen Hazen was with me in the investigation,—found in the reports of the State Board of Health of Illinois and in those of the Chicago department of health, as well as in certain documents published by associations of citizens such statements as drew our attention at once to the water supply, and further studies led us to believe that this was indeed the principal cause of typhoid fever in Chicago.

I should be glad to read in support of this position if it is proper to do so—

MR. TODD: I don't care to do that. I just wanted to ask you a preliminary question—

GENERAL CROW: You can put that in the record if you want to.

MR. TODD: Well, I object to it—Just read my question.

(Question read).

MR. TODD: Now that doesn't call for the report.

3885 GENERAL CROW: It is not his report; it is somebody else's.

MR. TODD: Do you consider that the question that I asked called for your report, Professor?

GENERAL CROW: It called for what he based it on.

MR. TODD: Read my question.

(Question read).

GENERAL CROW: You can finish your answer to the other question and then answer the last one.

THE WITNESS: Well, I will answer the last one first.

I do not consider that it calls for the whole of my report, but I am glad to be able to show briefly what the condition was at that time, in order to justify my conclusion that the epidemic was due to the pollution of the water supply.

MR. TODD: Q. Now that is all that I want for the purposes of my question. If you are desirous of putting your report in, why it is a matter that you have a perfect right to do; but it is a matter that I did not request and do not call for it.

THE WITNESS: I should like very much to put it in.

GENERAL CROW: In reply to the suggestion of respondent's counsel, the complainant states that the respondent has no right to dictate the answer for the witness, and that if the witness wishes to put something into the record which respondent thinks should not go in, he can move to strike it out.

MR. JEFFRIES: And I would make the further suggestion that the records from which the witness desires 3886 to read, state conditions as they existed at that time, and as he found them, and speak for themselves with more force than if stated by the witness from memory today, because it has been ten years since the incident occurred.

MR. TODD: I want to state in objecting to the introduction of the report, that the answer that the witness gave, namely, his conclusion, in regard to the condition there, was all that was intended and all that the question implied.

JUDGE JOHNS: I object on the part of the State of Illinois because the proposed reading is not in any sense or way pertinent to the question nor an answer to it.

THE WITNESS: Just read my answer there.

(Answer read).

THE WITNESS: (Continuing). If it will save the time of counsel, I can introduce the entire report, but if that is not proper nor timely, I should be glad to read some extracts from it.

MR. TODD: I made no request for any extracts from the report, and if the witness reads any extracts he does it voluntarily.

THE WITNESS: Certainly, in justification of my position at that time.

MR. TODD: As my question did not call for any facts upon which the conclusion was based—

3887 THE WITNESS: That is true, but to justify myself I should be glad to present some of the facts.

JUDGE JOHNS: To justify yourself about what?

A. About my conclusion.

Q. What conclusion?

A. That the water supply was the cause of the typhoid fever.

MR. JEFFRIES: And involves a question which was put to the witness by Mr. Todd originally.

JUDGE JOHNS: Your conclusion then or your conclusion to which you have testified now?

ATTORNEY GENERAL CROW: His conclusion then.

JUDGE JOHNS: Well, I am asking the witness.

A. You mean my conclusion in 1892.

GENERAL CROW: I am aware that you are asking the witness, but I have a right to suggest.

THE WITNESS: My conclusion in 1892, yes.

JUDGE JOHNS: Your conclusion in 1892?

A. Yes sir.

Q. What has your conclusion in 1892 to do with your conclusion in 1903?

GENERAL CROW: Your co-counsel asked that question, and the record shows it.

MR. TODD: That is correct; I wanted an answer on that
question for another question that I want to predicate it
3888 on. But I don't consider that because I asked the wit-
ness for a conclusion and he happens to have written a
book on the subject that the book should go in the evidence. I have no power to keep it out, except by motion to exclude, that is all; but it has no relevancy to the question which I had intended to follow it up with.

ATTORNEY GENERAL CROW: I suggest that the witness go ahead and read what he wants to, and you can cut it out afterwards.

THE WITNESS: I should like to change the word "justify" there to—where I said—what is the previous question?

(Question read as follows:) In your investigation, to what did you attribute the conditions of typhoid in the city of Chicago?

MR. TODD: Wait a minute; I would like to modify that question.

GENERAL CROW: I object. You can ask additional questions but let the record stand as it is.

MR. TODD: I want to change that question from "conditions" to "causes."

THE WITNESS: So that it will now read?

(Question read as follows:) In your investigations, to what did you attribute the causes of typhoid in the City of Chicago?

A. We attributed the cause of typhoid fever in the city
3889 of Chicago at that time to a pollution of the water supply
by sewage which according to the best information we

could obtain was from time to time washed out of the sewers and the Chicago river into the intake cribs, especially by floods and freshets, having found that the records of a number of years described a very remarkable and most unsanitary state of affairs, especially in the Chicago river. We did not ourselves make any further investigation than a study of the vital statistics and an examination of the local conditions. We did, however, find a remarkable series of records or statements in the reports of the Department of Health of the city and of the State Board of Health of Illinois, one or two of which seem to me to be germane to this case, and especially instructive under the conditions upon the Illinois river since the construction of the drainage canal—

MR. TODD: Now I object to the witness giving any facts which he believes germane to this case, as he is called as an expert to answer questions and not to give th [illegible] any bearing on this case one way or the other, as he may decide.

THE WITNESS: (Continuing). On page 16 of our report, we record the following statements in regard to the sanitary history of Chicago and the emptying of the Chicago river after freshets. It is taken from a report of the Citizens'
3890 Association upon the Main Drainage and Water Supply of Chicago, 1885.—

MR. TODD: Wait just a second, Professor; I want to get some objections in here. I object to the witness reading from any report of the Citizens' Association as the same is not legal evidence, and for the reason that it is not responsive to my question, but is injecting statements into the record that are not responsive and not competent as evidence.

THE WITNESS: (Continuing, reads from book.) "The "Sanitary history of Chicago is a history of makeshifts and "expedients. In the great rain of August 2nd, of this year— "1885—the contents of both branches of the Chicago river, with "the sewage accumulation of many weeks in the south fork, the "contents of slips, and the washings from several hundred miles "of low grade sewers, were in a few hours incontinently belched "into the lake. At every considerable freshet in the Desplaines "and in the north branch, or several times in an average sea-

"son, a similar obnoxious flood, differing little in degree, is "turned into the lake water. The ejection of such volumes of "sewage into the lake at irregular intervals, is a matter for "most serious consideration, in connection with the water supply. That it sometimes reaches the crib under favoring conditions of wind and current is a matter of direct observation "and evidence from city hydrants. * * *

3891 "That raw, unoxidized sewage occasionally and not "rarely contaminates our drinking water, does not admit of serious question. On Wednesday, August the 5th the "river discharge was obserbed in an unbroken stream to and "around the crib." There is much more of the same material but I think I have read enough to show that we had good reason to believe that it was the flushing of this great mass of accumulated sediment which was largely responsibe for the contamination of the water supply, especially as there was abundant evidence of a cumulative character in the official reports of the State Board of Health of Illinois and of the City Department of Health of Chicago and as, furthermore, we ourselves on one or two occasions saw the dark sewage material flowing out from the river toward one of the cribs, which we believed it might easily reach. We were loth to come to this conclusion because at that time we believed in the efficiency of the lake as a storage basin and purifying place, an opinion which was justified by the general opinion of sanitarians, and we had to fortify ourselves at that time by all the evidence that we could get, in order to come to that conclusion.

MR. TODD: I move to strike out all of the evidence as taken from this report as not responsive to the question.

Q. Did you ever find anybody that differed with the con-
3892 clusion that you arrived at, that the typhoid of Chicago was caused by the polluted water supply of the city.

A. We did, indeed.

Q. Who did you find, Professor?

A. The newspapers for the first few days after we published our report, referred to us as "jealous Bostonians" and men who did not know anything about it, affirming that the water supply of Chicago was "pure and unadulterated," and that "Lake Michigan is the most magnificent water supply in the world."

Q. (Question repeated).

A. I think my answer is responsive. They further quoted, if I remember right, some of the city officials who made similar statements.

Q. When was this report made, Professor?

A. I don't remember the exact date. Yes, it was read before the American Statistical Association on the 22nd of January, 1892.

Q. Did you know at that time that the Hering Commission had made a report upon the condition of the water supply of Chicago?

A. If I did, I have forgotten it.

Q. Did you know that a bill had already passed the legislature for the building of the drainage canal?

3893 A. I am not sure whether we did or not. I suppose we did. We certainly did before the paper was published, because it is referred to here with some satisfaction.

Q. Well, the bill I believe, was passed in 1889.

A. Then we probably knew.

Q. Assuming that the water supply of Chicago was contaminated by the sewage emptying into the lake, and this sewage was what caused the prevalence of typhoid fever in Chicago, would the elimination of all that sewage from Lake Michigan cause, in your judgment, a reduction of typhoid in the City of Chicago?

A. I should certainly expect it to do so.

Q. Do you regard the lake water at Chicago, if the sewage of the sanitary district, including Evanston on the north and Calumet on the south, as well as the city of Chicago, is eliminated from the lake, as contaminated water?

A. I never have until recently. Someone I believe, has lately suggested,—an engineer of some repute,—that possibly it is, from the sewage of Milwaukee, or the shores of Lake Michigan, at other places than those mentioned.

Q. My question is, do you. I cannot cross-examine these other people. I want to know if you do, you are a sanitary expert.

(Question repeated). And dangerous to the public health
3894 of the City of Chicago for drinking purposes?

A. I should certainly not consider it a seriously contaminated water, and certainly not very dangerous to the public health, but in view of the fact that steamers are constantly passing in and out of the mouth of the Chicago River, and in view of the fact that the Lake apparently is used by numerous fishermen and pleasure seekers, and in view of what I suppose to be the fact that in times of extraordinary rainfall the Chicago River may, even today have its current reversed for a time, I cannot say that I should consider the water of Lake Michigan within four miles of the shore, on the lake front of Chicago, as a perfectly wholesome and suitable material for drinking purposes, under the conditions assumed.

Q. Assuming that the river will not reverse its course when a gravity flow of 600,000 feet is passing the Bear Trap Dam, by the largest kind of a rainfall, eliminating that factor, what would you say?

A. Then, certainly the danger would be very much diminished, the present danger would be very much diminished, but would, I believe, still exist in some degree. The requirements of a pure water supply are steadily rising, and keeping in mind how great a city Chicago is likely to become in the near future, and keeping in mind also the increased use which will be made of the water on the lake front for commercial and pleasure purposes, I cannot escape the conviction that the 3895 water, even at the Four Mile Crib, would not be under the conditions assumed, entirely proper for drinking purposes, or likely to remain so.

Q. Do you know of any large city in the country whose water supply rises to the perfect standard fixed by sanitarians?

A. I do not.

Q. Do you know of any city in the country that will have a better water supply than the city of Chicago when the sewage of the Sanitary District is completely eliminated from Lake Michigan?

A. Yes, I think so. I think that the water supply of New York is better than that of Chicago would be under those circumstances, or would be likely to be later on. I think that the water supply of Boston is another example.

Q. Any other?

A. I think that the water supply of Philadelphia, if the filters now under construction and others which are contemplated are carried to completion, and are rightly constructed and rightly managed, will be such a case.

Q. What effect in your judgment as a sanitarian will the elimination of the sewage of Chicago have upon typhoid conditions in that city?

A. You mean the elimination by completing the sewers 3896 and bringing all that can be so brought into the drainage canal?

Q. Yes, and I will state that the system when completed, will be a complete elimination of the sewage of Chicago.

A. That ought to be followed by a material reduction in the typhoid fever death rate, and I should expect that it would be.

Q. As the reduction of typhoid takes place, the danger from the sewage of Chicago going into the lake will be thereby decreased, will it not?

A. Yes sir.

Q. And the elimination by that process will tend gradually to purify and improve the water conditions of Chicago, will it not?

A. I believe so; so far as that element is concerned.

Q. And that in turn will eliminate to a large extent the pollution and infection of the Illinois river, will it not?

A. The infection, not the pollution.

Q. I mean the infection.

A. The infection, yes, it ought to do so. But yet even it the rate is lowered it will not necessarily do so. The quantity of material put in will depend not upon the rate, but upon the total number of cases of course.

Q. I am speaking of the infection.

A. Exactly; but if the rate fell off one-half, and the 3897 total number of cases continued the same by the growth of the city, or by any other means, then the quantity put in would remain the same, the quantity of typhoid material put in would remain the same.

Q. But that is what is known as a gratuitous assumption, is it not? Under the conditions that I have assumed for the lake water?

A. I don't think so sir. I assume that Chicago is going to be one of the greatest cities of the world, and although I assume also, under the conditions mentioned, that the tyhoid fever death rate will fall off very largely, yet the total amount of typhoid material thrown into the drainage canal may even get bigger than it is at present.

Q. Do you believe that the growth of Chicago in population will be co-extensive with the increase of typhoid, with pure drinking water?

A. I don't understand the question.

Q. That the typhoid conditions with pure drinking water in Chicago will increase at the same rate that the population increases?

A. I should hope not. No man can tell, of course. I should hope and I look confidently for a material reduction in the death rate of typhoid cases and typhoid mortality per 100,000 of population, when the sewage is taken out of the lake 3898 altogether, but there will always be some typhoid probably in a city of that kind, and whether with an increase of the city in numbers, the total amount of typhoid infection going down the drainage canal will be as great as it was before, no man knows. I hope that it will not be. I should suppose that it ought not to be.

Q. Aside from the drinking water as a source of contamination, are there any other precautions that a city can take to prevent the presence of typhoid?

A. There are many other precautions. The matter of disinfectants, for example, of the excreta under the careful supervision of the Board of Health, with free disinfectants furnished to the poor, and with sanitary police to make sure that such disinfection actually takes place in the houses of both rich and poor; the careful isolation of cases as far as practicable, so that walking cases and the like, shall not distribute their excreta throughout the city; a better inspection of milk farms, so that cases of typhoid fever arising on the milk farms shall be shut out from the dairy yards and barns and the utensils which the milkman uses; the careful supervision of the oyster supply; the careful examination of the ice supply as to its origin, with pains taken that such ice as comes into the city shall be cut from proper sources, not exposed to sewage pollution, nor from sewage polluted streams of lakes. There are many pre-

cautions which could be taken to diminish the existence of
3899 typhoid fever in a city over and above that of pure water
supply.

Q. An anti-kissing society would be a good thing too, wouldn't it?

A. I think that it might restrict the spread of various diseases, though I have no great expectation that any such will be formed.

Q. Was the Chicago river at the time you made your investigations up there, and drew the conclusions that the sewage ot Chicago contaminated the lake, did it have any element or attribute of what is known as a septic tank?

A. I think it had in places, many of the elements and attributes of septic tanks a good deal of the time. It resembled very closely septic tanks in that it was essentially a mass of liquid sewage with a scum on the top, fermenting and purtrifying, as a septic tank should do.

Q. What is your opinion as to whether the conditions that obtained in the river at that time would destroy the presence of the bacteria of typhoid?

A. As I recall the river, and as I have refreshed my memory of it by reading my report today, or parts of it, I should say that some parts of the Chicago river at times were undoubtedly in such a condition as to be likely to abreviate life of pathogenic germs. I may add, however, that our knowledge of the life
of pathogenic germs in septic sewage is not as extensive
3900 as I wish it were, but so far as it goes, it points towards
their destruction under some circumstances in such
sewage.

Q. When the sewage of Chicago is diverted from the lake and the number of typhoids in Chicago are reduced, in your opinion, would the sewage discharged through the drainage canal in coming out into the Illinois river, spreading over the bottomlands and mingling with the vegetation there, would those conditions have a tendency to purify and eliminate the infection from the Chicago sewage?

A. There can be no question that such conditions as are mentioned near the end of the question, would have a tendency to remove from the flowing liquid the infectious germs referred

to and in so far to purify such flowing liquid. As to the first part of the question, the removal of the sewage from the lake into which it now goes and its turning down the drainage canal, other factors come in which must be carefully considered. As now is, the sewage going into the lake enters a large body of comparatively deep, cool and quiet water, in which the conditions for sedimentation and the detention of the typhoid bacilli upon the bottom are favorable. It is a grave question whether, after the sewage now thus going into the lake, and there undergoing more or less purification is gathered into intercepting and
3901 other sewers and sent rapidly down the drainage canal,
unpurified in any way, it may not actually bring it about, that more typhoid germs shall arrive in the Illinois valley than now arrive there. I have not, however, taken into consideration thus far the probable diminution in the typhoid fever death rate in the City of Chicago. If this diminution results, as I hope that it may, in a smaller quantity of typhoid fever excreta, this will be an immense gain; but if the city should grow, it may happen, as I have already indicated, that an amount of typhoid excreta may still be turned down the drainage canal, as great as that flowing through it today, or even greater, and if this should happen, there would be no sanitary advantages from the conditions assumed, but rather a disadvantage, especially if the rate of flow in the drainage canal should be increased.

Q. Professor, has the origin of the typhoid germ ever been located?

A. I think so, sir. Yes sir. It is found in various parts of the human body, especially in the spleen and in the alimentary canal.

Q. Does it have its origin in those locations of the human anatomy?

A. If I understand what you mean by "origin," I think I may say that it does. The origin of species is something
3902 which Darwin wrestled with a good many years ago, and
precisely where the first microbe, or the first man come from is still uncertain, but speaking of the origin of typhoid germs, for sanitary considerations, I think I may say that it is essentially as already stated.

Q. Is the typhoid germ found in any other animal than man?

A. I believe that there are so-called cases of typhoid fever in some of the lower animals, but these are, to say the least, uncertain, and I cannot say that the existence of such well defined germs has ever been made out. We therefore look to the human subject as the source of pollutions of water, sewage and the like, rather than to any of the lower animals.

Q. Will the sewage which enters the Illinois river at Peoria purify itself within 25 or 50 miles, in your judgment?

A. To a certain extent, yes, but not to such an extent that I should consider the stream in which it is poured fit for drinking purposes.

Q. In a hypothetical question, the last one that was put to you by General Crow, that if a conduit connected with Lake Michigan at the mouth of the Chicago river transmitted a volume of water equal to 300,000 cubic feet per minute to Grafton and emptied the same into the Mississippi river, whether that amount of Lake Michigan water would endanger the water supply at the St. Louis intake. 3903

GENERAL CROW: You have not all the facts that I assumed. I assumed also that the conduit contained all the sewage of Chicago emptying into Lake Michigan.

MR. TODD: That is what I was going to add to that. And, adding the suggestion that General Crow just made, did you assume in that question the sewage that now empties into Lake Michigan as distinct from the sewage which empties into the Chicago river, a limited sewage contamination, to that which entered lake Michigan?

A. That was my understanding of the question. Assuming that only water of Lake Michigan, at the mouth of the Chicago river and its vicinity—I think the question ran like that.

Q. Have you ever made an analysis of the waters of Lake Michigan at that point?

A. No sir.

Q. Would the analysis of the water at that point made by any method now known to science, assist you in coming to the conclusion that you did?

A. Analyses are always valuable aids, but even if I had, as was the fact, no analyses, I should have to come as I did come, to the conclusion simply upon the fact that the sewage of somewhat more than a quarter of a million of people, as I under-

stand, is now going into the lake not very far from that
3904 point, and that the water of the lake is now being taken
into the Chicago river, thus drawing upon these not very remote points of sewage discharge, and also sucking in the inevitable contaminations which the lake front in any big city must receive from steamboats and fishermen, and so on.

Q. Are you acquainted with the lake front in Chicago?

A. Fairly well, but not very well.

Q. Do you understand that on the North Side of the City there are fishermen?

A. No, as I remember the North Side, it is the beautiful residential portion.

Q. And on the south side from 12th street south to 53rd is occupied by the Illinois Central Railway tracks?

A. I am aware of that, and it may not be a fact today; but certainly not many years ago when I was there, the whole shore just outside of the tracks was lined with fishermen, so that every post had a man sitting on its top with a fishing pole in his hand. That may have all been done away with. I haven't been there very lately, but it was a remarkable fact, because I have made some investigations of the exposure of drinking waters to the doings of fishermen, and once traced an epidemic of typhoid fever in Haverhill, Massachusetts, to the probable infection of
the water supply at the intake or reservoir by fishermen
3905 who were out in a boat in that vicinity.

Q. What proportion of dilution would such a volume of water entering the Mississippi at Grafton, bear to the Mississippi River?

A. Dilution of sewage, do you mean?

Q. Yes?

A. I don't know, I should say that the dilution would be enormous from Chicago.

Q. In that hypothetical question, taking 300,000 cubic feet of water?

A. Exactly, as I say I should think that the dilution of the sewage at two ends of the Sanitary District, whatever they are, would under that condition be enormous.

Q. And mixing with the Mississippi river at Grafton?

A. It would be still further increased?

Q. And that condition in your opinion would render the water supply of St. Louis dangerous and unsafe?

A. Without some form of purification.

Q. Under the present conditions, I mean?

A. Under the present conditions, that is, at the intake you mean?

Q. Yes sir.

3906 A. Yes sir.

Q. And would that be more dangerous than the water supply of St. Louis was prior to the opening of the drainage canal?

GENERAL CROW: I object to the question because it is wholly immaterial.

A. I cannot say as to that. I have already testified, I think, to the fact that I did not regard the Mississippi water previous to the opening of the drainage canal as it arrived at the chain of rocks, as suitable for a modern city, but as to less or more I cannot say without a very careful investigation.

Q. Professor, in the question that I asked you in some previous part of my cross-examination, I assumed that the number of typhoid cases in St. Louis for the month of November was 480, and for the month of December 350, and I find the facts to be 482 in November and 116 in December. If the questions had been correctly stated according to those figures, would it make any difference in your answers?

A. No sir, that would probably have made no difference in my answers.

WILLIAM T. SEDGWICK.

ADJOURNED until 10:00 A. M., Saturday, May 23, 1903.

3907 Southern Hotel, St. Louis, Missouri. 10:00 a. m., Saturday, May 23rd, 1903.

Parties met pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

WILLIAM THOMPSON SEDGWICK

resumed the stand for re-direct examination by Attorney General Crow and testified as follows:

Q. Professor, in your previous testimony you used the term "normal typhoid," is that an accurate expression and will you please define to me what you mean by that term as used in your testimony?

A. I have used the word "normal" typhoid and, although I perhaps explained it sufficiently for passing purposes, I want to be careful not to give an impression that this is a common term, or a safe term for use in this kind of work. In thinking the matter over since, I am inclined to prefer the word "residual" typhoid, to normal, meaning by that that the amount of typhoid which remains in any community after deducting any particular element under consideration and especially any larger important element—

3908 Q. Element of what?

A. Element of the causation of the fever itself, or what contributed to it. I had in mind what contributed to it.

Q. That's what I supposed, but you didn't state that.

A. I am simply trying to arrive at a good scientific statement of the case for use hereafter if need be. The word "normal," as applied to a disease being objectionable, and I should say, for example, that in the city of Chicago, after deducting the typhoid fever which might be reasonably attributed to infected water, if it should appear that the amount then remaining in the city was fairly comparable with the amounts remaining in cities having good water supplies, such remnant or remainder might well be called the residual, rather than the normal typhoid, and I should say the same thing of St. Louis or New York or Boston or any other city. It is simply that I wish to place myself straight on the use of a term which I do not altogether like, the more I think of it.

Q. Now Professor, in your cross-examination you dealt somewhat with the question of number of cases of typhoid. fever in the watershed tributary to the intake tower at St. Louis, and those cases in the Sanitary District of Chicago. Have you any figures that would enable you to give me the total amount of cases as reported from which the complainant has submitted typhoid statistics on the water-shed tributary
3909 to the intake tower of the St. Louis waterworks for the years 1897, 1898 and 1899?

A. Yes sir.

Q. What are the towns?

A. Those that I happen to have before me are St. Charles—

Q. Well, never mind. You needn't name the towns. It will just take up time. If you have the number of cases, give *them.*

A. You mean the number of deaths.

Q. The number of deaths as given by the statistical reports that were put in on that territory.

A. These are all in the record and have been referred to repeatedly, I think, by counsel on both sides and are in round numbers for the years 1897, 1898 and 1899, something like 1,100 deaths.

MR. TODD: Is that for the three years?

A. That is for the three years, yes sir. This would mean say about 11,100 cases for the three years under consideration.

GENERAL CROW. Now have you any statistics which would show the number of deaths from typhoid fever in the Sanitary District of Chicago for those three years, 1897, 1898 and 1899?

A. Do you mean that for the same years, 1897, 1898 and 1899?

Q. Yes, that's what I mean?

A. In the city of Chicago during the same years, 1897,
3910 1898 and 1899, the total number of deaths reported was
1,515, which would mean about 15,100 cases.

Q. Now have you any statistics that would give the number of deaths in the water-sheds tributary to the Missouri river, as reported by the statistics for that territory submitted by complainants heretofore during the years 1900, 1901 and 1902?

A. I have, and these amount, according to the figures I have before me, to 1,144 deaths.

Q. How many cases would that amount to?

A. About 11,400 cases.

Q. Now have you any figures which would give the deaths, by typhoid fever from the Sanitary District of Chicago for 1900, 1901 and 1902?

A. The total deaths for the period of 1900, 1901 and 1902, in Chicago was 1647, which would amount to about 16,400 cases.

Q. Now, Professor, in your cross-examination, one of the first questions that was asked you was with reference to whether it wold cost any more to filter the water supply of St. Louis after the opening of the drainage canal and now, under present conditions, and those that existed then, than it would have cost before, and I want to ask you what you have to say about that proposition now, considering your answer as given then, and the state of facts as they exist?

A. The question, as I remember it, was in regard to puri-
3911 fication by filtration and my answer was, that the cost
would probably not be materially increased by the addition of the pollution and infection derived by the city of Chicago or the opening of the drainage canal. On reflection, however, I realize that I did not take into consideration with sufficient care the fact that aside from the masses of filth that might be washed down on certain occasions, such as freshet periods and which would add somewhat to the cost of the cleaning of the filter and caring for the same,—a cost which might or might not be a material increase in the conduct of those filters according to the importance attached to the word "material",—there is and would be the necessity for a much keener watch of the filters in regard to protection of operation, so that it might make a difference for example between the employment of a low-salaried man and a high-salaried man as resident manager of the works. The fact is that in all our big cities using water filters, although at first it was thought that almost anyone could manage them, and low-priced men were often put in charge, experience is rapidly teaching us that the best men are none too good to supervise filters and safe guard the citizens against the incoming of the germs of infectious diseases. The volume of water passing through is so large that possibilities of damage, by frost, to the filtering material, and the possibility of channels working
through the filters, and various other factors are making
3912 it every day more and more clear that we have got to have
able and experienced and high priced men in charge of these things, so that even at present I do think there would be a material increase of cost in the probable management of such filters because of the added pollution and infection from the city of Chicago. This is more particularly the case at present be-

cause there either is now or lately has been in the city of Chicago, a typhoid fever epidemic, the number of deaths in the year 1902 having been larger than at any time since the great epidemic of 1890, 1891 and 1892. The actual occurrence of such an epidemic at the present time, or very lately would of necessity be a source of the greatest solicitude on the part of anyone operating filters in St. Louis during or shortly after any such epidemic and it would be necessary to employ extraordinary care in operation and superivision of such filters even at the present time because of the epidemical condition of typhoid fever in Chicago in 1902. Furthermore, inasmuch as Chicago has repeatedly suffered from outbreaks of the disease which can be fairly called, and have been called, epidemics, the present operation of filters in the hands of any competent person would require extraordinary and constant attention and skill; and such things are costly.

Q. Well, can you state whether or not there might in the future rise a condition by reason of the increase in popu-
3913 lation of Chicago to say, three or four million people that a single filtration would not suffice?

A. I think I have already intimated in some part of my testimony,—I have already expressed in some part of my testimony, an opinion to that effect and in consideration of the already large amount of typhoid fever in the Sanitary District or City of Chicago, and in view also of the rapid increase of population in that city I should expect that such cost of maintenance and operation of filters as has been just referred to might steadily increase until it might even become necessary to resort to double filtration. Looking still further into the future, there might even come a time when at low periods of flow, the oxygen in the river should disappear altogether for brief periods and septic conditions should rise and new difficulties in filtration be introduced, not necessarily by the typhoid fever alone, but by the presence of mere filth which should so corrupt the stream as to render the water unfit for drinking purposes under any consideration. This, of course, would probably be a very long time in the future, but it is entirely within the bounds of possibility. Many a stream that was once bright and pure has been converted into an open sewer, a stinking nuisance, not only unfit for drinking purposes, but a source of obnoxious odors and the like; as for

instance happened in the Blackstone River in the state of
3914 Massachusetts, which was formerly a bright, pretty
stream, but which has been so defiled by the sewage of the city of Worcester, that between Worcester and the town next below,—Millbury by name,—it is simply an open sewer; or as has happened, I suppose, in the little stream in St. Louis known as Des Peres, which anyone can see is now practically an open sewer, but which was presumably a few years ago a decent stream. It seems to me that it is precisely these long looks into the future that we have got to take in cases of this kind. The population on the Missouri and the Mississippi is rapidly growing, the defiling of the rivers is increasing and likely to increase because of this growth, and the addition of a vast population like that of Chicago, discharging its filth into the Illinois River, a tributary of the Mississippi, and contributing to that general deterioration of the river is bound to go on unless some steps are taken to correct it, is a matter, it seems to me, of grave consequence and likely to add a heavy financial burden to any city using its water. I may say still further in regard to the Blackstone, the history of which is very interesting in this connection and important, that while the Blackstone river is furnished with various dams which were formerly sources of water power, these are gradually filling up and although at times the water flowing over them is very clear, at flood times it is black and dirty and
the river, flushing itself to a certain extent, removes these
3915 impurities and puts them further down, but has thus far
failed to come anywhere near purifying itself in the upper reaches, and is of course not used as drinking water below. The stream has been turned from a respectable river, into a most objectionable and abominable open sewer between Worcester and Millbury. Bearing in mind furthermore, that the dry water flow, the low water flow of the Mississippi river at St. Louis is something like 40,000 or 42,000 cubic feet a second; and that Chicago is already pouring down 5,000 cubic feet a second of mixed water and sewage; and that the drainage canal is built in places for the carriage of at least 10,000 cubic feet a second, it seems to me fair to inquire what will be the effect of that mixture of 10,000 feet a second of water and sewage with the Mississippi river, which at times is only flowing 40,000 or 42,000 cubic feet

a second in volume at St. Louis. Here we come it seems to me, near to the danger line. It is not at all inconveivable that all things considered, when 10,000 cubic feet a second are poured down, and are more readily charged at Chicago with mere pollution,—quite aside from typhoid fever,—the presence of this material in the Mississippi, itself growing more polluted meanwhile may bring about or help to bring about at certain seasons of the year a condition approaching that of a septic tank, when the oxygen will begin to fall off in the water and that
3916 water will begin to degenerate into a condition of dilute
sewage. All these large and general propositions, it seems to me, have got to be kept in mind. I think they involve added cost today, and I think they will involve a very greatly increased cost in the near future, and they may even amount within fifty or a hundred years to such a pollution of the Mississippi river in dry weather times, low water times, as to make it an impossible source for any modern civilized city; for it is fair to suppose that cities in the meantime will not relax their sanitary requirements as to water supply, these having long been steadily rising, so that even double filtration in time may not suffice. In regard to the probable number of cases of typhoid fever in Chicago during the last three years, as compared with the number in the cities on the rest of the watershed during the same period, and in regard to the number in the cities on the watershed before the opening of the drainage canal above the intake of the chain of rocks, I am deeply impressed with the fact that while I have been able to learn of only about 11,000 cases in the cities on the watershed during each of the three year periods referred to, before and after.

Q. During each or during the total?

A. During each of the three year periods,—above the chain of rocks and exclusive of the sanitary district of Chicago;—I find that there must have been about 16,000 cases in
3917 Chicago during the period of three years since the open-
ing of the drainage canal; so that it appears that the opening of the drainage canal has more than doubled the probable number of typhoid fever cases in the urban communities on the watershed above the intake at St. Louis. Moreover, al-

though Chicago is some 358 miles distant from the city of Louis, some of the cities on the Missouri and Mississippi wat sheds are even farther away, many of them, perhaps, fartl away. When I consider all of these facts taken together, I c not escape the conclusion that the opening of the drainage ca was a very grave addition to the sanitary and financial burd of the people of the State of Missouri using the Mississippi ri below Grafton.

MR. TODD: In behalf of the Sanitary District of Chica I move to strike out the answer as not responsive and as i proper on re-direct examination.

GENERAL CROW: Professor, in your cross-examinati reference has been made to the dams I believe, in the Illin river, to their probable effect on the flow of the stream w reference to the effect of currents and sedimentation and t general proposition of the result of dams on the disappearar of infected sewage in running water, and I will ask you to st from your knowledge of the general subject what in general
the effect of the dams in running streams on the dis
3918 pearance of infectious matters in the waters, which ki
of infectious matters may convey water-borne diseas

A. The general effect of dams is of course hold back the water and to produce slack water basi especially when the dams are high enough to che the flow entirely or essentially, and any checking the flow and slowing down of the stream, other thi being equal, favors sedimentation and the disappearar from the supernatant waters of the infectious material. T sanitary significance of this is, as I have already stated, e tremely interesting and important. The carrying down of t germs of infectious diseases and the longer or shorter detenti of them in the sediment, in the first place removes them from t moving water, or tends to remove them, and in the second pla by detaining them gives them an opportunity to die out, more less. These factors of sedimentation and storage are, in n judgment the principal factors in the so-called self-purification streams; on the other hand it must be carefully kept in mi that streams are subject to scouring more or less frequently a that the disappearance of infectious materials is not necessar

their destruction. It is even possible to conceive of such conditions in the bottom of a stream or pond as shall favor the longevity of germs, but broadly speaking, generally speaking,
3919 sedimentation and storage, as favored by dams, are temporarily at least of much value to the water from which they disappear. Again, broadly speaking and keeping in mind the conditions in this case, I think we must be very careful not to assume too readily that such sedimentation and storage or such disappearance of bacilli or other microbes, is necessarily or even occasionally equivalent to a continuous or uninterrupted purification of the stream. A considerable increase in the flow of such a stream as the Illinois river must tend to favor the return to the supernatant stream or lake or pond of some of the materials which it had previously deposited. The same thing may happen with wind currents. It is a well known fact that Lake Erie for example is so readily disturbed by winds as to bring up sand and sediment from the bottom, and interfere with the use of the water at Buffalo for drinking purposes. It is a well known fact that shallow ponds and lakes are particularly susceptible to disturbance by currents produced by winds. In my judgment one can never know when some of the deposited material may be returned to the flowing stream, nor how long it may stay there. The problem is by no means a small one, and while there is undoubtedly a high value in sedimentation and storage of infectious materials, and a tendency toward their permanent removal, either mechanically or by death, I do not
3920 feel that the processes referred to, are trustworthy means of sewage purification under such conditions as exist in the Illinois river.

Q. Now the term "standard of dilution for reasonable safety," has been used somewhat by those asking questions in the cross-examination. I will ask you to state if in sanitary science of water supplies there is any standard of dilution for reasonable safety that is recognized and adopted, for drinking purposes?

A. I never heard of it.

Q. Now I believe you stated in your cross-examination that typhoid bacilli have been rarely found and identified in running water?

A. I think I did. Very rarely.

Q. Are there other bacilli that are transported by water and convey what you call water-borne diseases, that are also, very seldom found, yet generally recognized as a source of drinking, water-borne diseases?

A. Yes sir.

Q. What are they?

A. The cholera germ for example, the Asiatic cholera germ.

Q. Any others?

A. And the supposed germs of diarrhea, dysintery—

Q. Any that convey animal diseases?

3921 A. Yes, glanders. While I do not know whether glanders has been found in the water, still glanders is supposed to be conveyed to horses, from one horse to another by water.

Q. How about anthrax?

A. I think that anthrax has been supposed to be conveyed by water.

Q. How about hog cholera germs?

A. One moment. In regard to anthrax. There is every reason to suppose it might be so conveyed, because it is one of the hardest germs to kill of all that we have. It is a spore bearing germ, and when it so to speak, goes to seed, those seeds are very enduring; they are very tough, resisting heat and long periods of keeping, without destruction, and I should think that there might be no question that these would live a very long time in water, although whether they have actually been found in running water I do not recall. I think they have. But in all this matter of finding specific disease germs in water one needs to know who has found them, because some bacteriologists are more readily persuaded of their presence than others.

Q. Well, isn't there a record of the anthrax bacilli having been found in the Illinois river by the State Board of Health of Illinois?

A. I dare say, but I don't know.

Q. What about the hog cholera bacilli, are they conveyed 3922 by water?

A. These animal diseases I am not thoroughly posted upon but my impression is that any of them may be conveyed by water and that hog cholera is often conveyed in that way. I do not wish to give that however, as my positive opinion, because I do not recollect.

Q. Now as to the result of typhoid fever, and Asiatic cholera in persons, the bacilli being so hard to obtain from the water, in what manner must the conveyance of that disease therefore be judged by?

A. I don't quite understand the question.

Q. By what must you judge the conveyance of these waterborne diseases, typhoid fever and Asiatic cholera if you are unable as a rule to find the bacilli in the water?

A. One must judge by the effects which the water produces upon those who use it.

Q. You judge by the results?

A. By the results. That is the one final standard we have in sanitary science today and it is the best standard because, after all that is the point at issue. If a community drinks sewage polluted water and it can be clearly shown that there is a connection between the use of such water and the typhoid history of that community, we have far better evidence than any chemical or bacteriological evidence can possibly be, in the present state of these various sciences? 3923

Q. You said something in your cross-examination, about having studied the life history of typhoid bacilli during the Lowell and Lawrence epidemic, now I will ask you if that experience furnished you the only knowledge you have on the question of longevity and life of the typhoid bacilli?

A. No, I did not intend to say that by any means. Those were laboratory studies and of course at that particular time, such epidemiological evidence as I could get. A little later came the Newburyport instance, which was very instructive as to the longevity of typhoid bacilli, and since that time by observing the work of others, and by studying other epidemics I have considerably extended my acquaintance with the subject.

Q. Now you were cross-examined with reference to the Lowell and Lawrence epidemics, as to whether or not there couldn't be some causes on the watershed adjacent to the water supply of Lowell and Lawrence and Newburyport that might have contributed to the cause of those epidemics. I will ask you to state what examinatoin if any, you made of those watersheds at that time to determine that question?

A. I started out from Lowell and went up the bank of the river to North Chelmsford, inquiring along on one side, (there were no houses at all on the other side) and in walking
3924 along I asked the physicians who lived nearby if they had seen any typhoid or heard of any around there, and did not find any between Lowell and North Chelmsford. I also made careful inquiries above North Chelmsford, not only along the banks but in the cities discharging sewage into the river, to see if there had been any epidemic above, which would explain the facts, for they were always pouring in sewage above, and Lowell for a long time, had had considerable typhoid, but nothing unusual could be discovered at any of the points, urban or rural, upon the river as far as I went. Of course I didn't go all over the Merrimac water-shed which is a very large affair, but I went far enough to satisfy myself that no unusual condition had existed nearby or in any of the big cities, or in any place where the sewage would not be subjected to more or less sedimentation and storage and dilution. Then when the Lawrence epidemic appeared, I did not myself go along the river, but I sent one of my assistants, a trusty fellow, to see if he could find anything between Lowell and Lawrence, and especially as the Lawrence epidemic came in later than we at first had expectd, for we were not then aware of the full value of storage and sedimentation as we are today, at least I was not, and having expected the Lawrence epidemic a little sooner than it came I sent him to Lawrence to see if any people had been taken sick along the shore from the Lowell sewage, that would go along
3925 there, but he didn't find anybody, besides, if we had found one or two cases, this would not have accountd for the facts in the Lawrence epidemic because the Lawrence epidemic was more severe, proportionately to the population, than the Lowell epidemic and the water supply was guarded by a reservoir, so that the simplest explanation of the law of parsimony would have been, even if we had found a few cases up there, that it was 500 to 1000 cases at Lowell, which was producing the epidemic, rather than the few cases along the shore. I went along the shore more to find out whether the people got it from Lowell

rather than whether they were giving it to Lawrence, but we didn't find anything at all.

Q. Now you have said in your cross-examination I believe, that the epidemic at Newburyport in proportion to the population was more severe than either Lawrence or Lowell?

A. I don't remember that I said that.

Q. Was it or was it not?

A. I do not recall, I shouldn't have said that it was.

Q. I thought you did.

A. I can easily tell by looking it up.

Q. You can look it up at noon or some other time.

A. I think I can tell in a minute by figuring.

Q. Well, go on, you can do that later.

A. All right.

3926 Q. Now I will ask you if you meant to state in your cross-examination that the typhoid fever at Pittsburg, was caused by the typhoid fever epidemic at Oil City, Pennsylvania?

A. The typhoid fever that existed, did you say?

Q. Yes?

A. No sir, I had no evidence of any epidemic at Oil City, or at Johnstown, which was another of the urban communities on that watershed; nor did I find any "epidemic," using that word in the sense of explosion and a large number or unusual number of cases for a short time,—in Pittsburg. The condition in Pittsburg was rather more like that in St. Louis today, a large amount of typhoid fever, rather than what I should call an epidemic, though as I said yesterday, some people might call it an epidemic in either case, Pittsburgh or here, and I came to the conclusion that the state of affairs, whatever it was called, in respect to Pittsburgh was due, not to any epidemic in Oil City, any special epidemic, or in Johnstown, or in any other community upon the watershed,—because I couldn't find in any of these any such unusual occurrence of typhoid fever,—but rather that the regular and steady occurrence of typhoid fever in many places on the watershed had each contributed its proportional share to the making up of the total in Pittsburg; and as the case at Pittsburg is interesting, it seems to me, and important in this

case, I should like to read twenty lines or so from my pub-
3927 lished report as to just what I did find and report at that
time.

JUDGE JOHNS: I object to the answer so far as Pittsburg is concerned, because the subject was gone into in chief and cross-examined upon, and is not a proper subject of re-direct examination, and I object to the reading of anything upon this re-examination upon that subject, and the extract proposed to be read, whatever it may be, as neither relevant nor competent evidence, and as not pertinent upon a re-examination of the witness as to the condition of affairs found in Pittsburgh, as narrated in his testimony.

MR. TODD: I join in the same objection in behalf of the Sanitary District.

A. (Reading) "The life of the typhoid germs in water while
"it has never been satisfactorily determined is without question
"capable of extending over a considerably greater period than
"that required for the water of the Allegheny to pass, even from
"remote points on the water-shed, to the intake of the Pittsburgh
"waterworks, so that there seems to be no escape from the con-
"clusion that typhoid fever infection introduced even at remote
"points, may and even must be delivered to the citizens of Pitts-
"burgh in an active and virulent condition. Oil city is distant
"from Pittsburgh 113 miles, but such is the peculiar character
"of the river and such the character of the watershed,
3928 "that infection introduced at much more remote points
"than Oil City may in my opinion be actively dangerous
"to the health of Pittsburgh." This is from my report to the Filtration Committee of the City of Pittsburgh, published in January, 1899.

JUDGE JOHNS: I move to strike out the extracts so read as irrelevant and incompetent.

GENERAL CROW: Now, something was said in your cross-examination about your not having considered in estimating the pollution of the waters tributary to the intake tower of St. Louis waterworks, the number of fishermen along the Illinois river and other streams. Now I will get you to state if you know whether or not it is a fact or if you know in what degree the people living upon the banks of, or adjacent to running streams in rural communities, pollute such streams and infect them?

A. I have no personal knowledge of the actual conditions on the watershed above St. Louis in this particular,—

Q. I mean running streams generally.

A. I was going on to say,—but speaking from such knowledge as I have I may say that it would depend a good deal upon the streams broadly speaking, since upon streams passing through large, uninhabited districts, there must be large stretches in the river in which no pollution at all would take place. On the other hand, in agricultural communities,
3929 the use of the banks and the occupancy of house-boats and
the presence of fishermen would undoubtedly contribute its natural quota, whatever that might be, to the pollution and even the infection of the stream; but inasmuch as the shores of streams are always small in extent in comparison with the watersheds which they drain I should suppose that this factor would not be a large element in the pollution or infection produced by such a rural population. In the case of rivers passing through cities, and apart from the sewage pollution from sewers, owing to the larger number of people on the banks of the stream, and to boats and the like, there must be a considerable pollution; but broadly speaking and proportionately speaking I should not expect that the river pollution by persons upon or near the river itself, would be of much consequence in proportion to those remote from such streams,either in rural districts or in cities, respectively; that is, there would be more of course where cities border on a river, but that I should suppose would bear some such proportion to the people in the city, as the people on the rivers in the country would bear to the people on the rural watershed. Of course any such estimate is all guess work, I really do not know much about it. Nobody does.

Q. Well, as a matter of fact do you know whether the
3930 agricultural people, people living on the farms in the
watershed, and away from the banks do, or do not pollute the running streams to any degree?

A. I have already said, broadly speaking, that they take care of their own wastes upon their own farms.

Q. You said in your cross-examination in answer to a question asked you that you thought perhaps the typhoid increase in December, 1899, did reach over into 1900. I will ask you to state if you know how far into 1900 you think that reached, if you have any idea as to how far it reached?

A. I think that question is very easily answered.

Q. Will you please answer it?

A. Because while in 1900 there were 19 deaths from typhoid fever, which was a larger number than had happened in January for several years, at least, in February the number of deaths was only five, which was a smaller number than in 1897, 1898 or 1899. This in my judgment, shows that the little outbreak at the end of 1899, whatever it may have been due to, had spent itself, while the occurrence of 16 deaths in March, 1900, has been attributed, and I believe properly attributed, by Dr. Ravold, to the opening of the drainage canal on January 17th. At least a part of that increase may have come and probably did come from that source. On the other hand the deaths in the next month fell off again to four, which was lower than during the two previous years, so that it is not easy to be absolutely sure that the number 16 did really come to any great extent from the
3931 first arrival of the material held in the drainage canal. I may add that it is only by taking these things in a large way and for considerable periods that any safe conclusion can, in my judgment, be drawn.

Q. Professor, after sewage which is infected with bacilli of waterborne diseases is placed in running water, is there any absolute safety in using that water afterwards for drinking purposes within a month's time?

JUDGE JOHNS: I object to that question as not re-direct examination, the subject having been gone into in chief extensively.

A. Broadly speaking, I do not think that there is.

ADJOURNED until 2:00 P. M., same day.

Southern Hotel, St. Louis, Missouri.
3932 2:00 P. M., Saturday, May 23rd, 1903.
Parties met pursuant to adjournment.

Present the Commissioner and same counsel representing the respective parties.

WILLIAM THOMPSON SEDGWICK,

resumed the stand for further re-direct examination by Attorney General Crow, and testified as follows:

THE WITNESS: I have been looking over what I said this morning, or parts of it, and I find that in answering the next question to the last I contradicted myself and I desire to put myself right on the matter.

(Question and answer referred to, repeated as follows:)

"Q. You said in your cross-examination in answer to a question asked you, that you thought perhaps the typhoid increase in December, 1899, did reach over into 1900; I will ask you to state if you know, how far into 1900 you think that reached, if you have any idea as to how far it reached?

A. I think that question is very easily answered, because while in 1900, there were 19 deaths from typhoid fever,
3933 which was a larger number than had happened in January
for several years at least, in February the number of deaths was only 5, which was a smaller number than in 1897, 1898,or 1899. This in my judgment shows that the little outbreak, whatever it may have been due to, had spent itself and the occurrence of 16 deaths in March, 1900, has been attributed, and I believe, properly attributed, by Dr. Ravold to the opening of the drainage canal on January 17th. At least a part of that increase may have come and probaly did come from that source. On the other hand the deaths in the next month fell off again to four, which was lower than during the two previous years, so that it is not easy to be absolutely sure that the number 16, did really come to any great extent, from the first arrival of the material held in the drainage canal. I may add that it is only by taking these things in a large way and for considerable periods that any safe conclusion can, in my judgment be drawn."

THE WITNESS: Now I should like to have the greater part of the answer stand as it is. Will one of you read it while I alter it?

JUDGE JOHNS: Suppose you make an answer now, and leave that answer stand.

A. Very well; I will make an entirely new answer.

(Question and answer repeated).

3934 A. In answer to the question I may say—

GENERAL CROW: Professor, excuse me. Let the record show that being as the gentleman wants your other answer to stay in there, that counsel do not want that answer changed, that you now want to correct your former answer by making this answer. That makes it connected.

A. I do not quite understand.

GENERAL CROW: The gentlemen object to your altering your former answer and taking it out of the record.

A. I did not intend to do that.

GENERAL CROW: Let your answer show the reason for giving a new answer, so that the record will explain itself without any interpretation.

A. Well I supposed that the stenographers had already taken down my statement that it was self-contradictory which would be a sufficient reason for changing it, and now I was going to change it into a form which would not be self-contradictory. What I intended to say was this, that there is evidence that the out-break at the end of 1899 reached over into 1900, as is seen in the fact that there were nineteen deaths in the month of January in the City of St. Louis from typhoid fever, a larger number than had occurred in that month for several years previous. On the other hand it is very clear that the out-break referred to had spent itself in February for the number of
3935 deaths from typhoid fever in St. Louis in February, was
lower than in any of the three years preceding; the number rises again, however, in March, being sixteen, a number larger than for several years before in that month, and it might be thought by some epidemiologists, in fact I should myself have suspected, if I had no other explanation of the fact that these sixteen deaths meant a recrudesence of the previous outbreak. Fortunately, however, we have a simpler explanation in the fact that the Chicago Drainage Canal was opened on January 17th, 1900, and it is in evidence, I believe that not long after a mass

of black and dirty water arrived at the intake of the St. Louis waterworks, which was believed to have come directly from the Chicago drainage canal. In view of this evidence I regard the excess in March, or at any rate, the larger part of it, as due not to a recrudesence of the outbreak at the end of 1899, but to the pollution of the St. Louis water supply by material arriving from Chicago. This conclusion was reached, I believe, or a similar conclusion by Dr. Ravold, who, as it seems to me, very properly attributed the greater part of the excess in this month to the cause described.

MR. TODD: I want to enter an objection to this witness testifying to the conclusions expressed by another witness
3936 in the case, as being plainly incompetent.

THE WITNESS: I should like to continue. Read the last part of my other answer.

(Answer to former question read to witness).

A. In April on the other hand, the number was again low, which goes to show that the cause which operated, or the cause of the deaths in March, was apparently absent, or at least very slight. In matters of this kind we must take the statistics in a broad way, and cover considerable periods of time if we wish to be absolutely sure.

MR. JEFFRIES: Professor in a question put to you by Mr. Johns on cross-examination, he stated as an assumed fact that the population along the banks of the Illinois river produced a larger number of typhoid cases than populations not upon the river, whether they be urban or both, and that the typhoid dejecta would more readily find its way directly into the Illinois river coming from the population along the banks of the river, and the towns situated upon the banks of the river. Now state in your opinion, what effect the increased flow of water in the river coming through the canal at the Bear Trap Dam would have on hastening this typhoid dejecta to the mouth of the Illinois river and into the Mississippi river?

MR. TODD: I object to the question upon the ground that
3937 the preamble is not a part of the question itself, and that the question has already been answered on direct-examination and is not a proper matter to go into again on re-direct examination.

A. You mean the increased flow from the drainage canal?

MR. JEFFRIES: Yes, hastening the typhoid dejecta at any time after they opened the canal.

A. It would obviously move it forward more rapidly and quicken somewhat its delivery into the Mississippi river and the time of its arrival at the intake of the St. Louis water works.

Q. Assuming that the water supply of the City of St. Louis has been treated in the same manner since 1895, what in your opinion, was the sanitary condition of the water supply of that city after treatment, for the years 1895, 1896 and 1897, based on the typhoid fever death rate of the city for those years?

JUDGE JOHNS: I object to the question on the ground that it is not a subject of re-direct examination.

MR. TODD: I make the same objection.

A. If I understand the question, it is, what was the sanitary condition of the water supply of St. Louis during the years 1895, 1896, 1897, 1898 and 1899?

MR. JEFFRIES: Yes.

3938 MR. TODD: I want to object because the question does not assume all the typhoid conditions that existed during those years along the watershed of the Illinois river, the Mississippi river and the Missouri river.

A. My answer is that judging partly by my knowledge of the method of sedimentation employed, but chiefly by the typhoid fever death rate in St. Louis during those years, that the sanitary condition of the water supply as actually delivered to the citizens during those years, was good.

MR. JEFFRIES: What is your opinion as to the sanitary condition of the St. Louis water supply based on the typhoid fever death rate of the city since January 1st, 1900, which includes the three years that the Chicago drainage canal has been opened, assuming that there has been no change in the treatment of the water supply of St. Louis.

MR. TODD: I object to that question in behalf of the Sanitary District, on the ground that it is not re-direct examination.

JUDGE JOHNS: The State of Illinois joins in the objection.

A. Using precisely the same line of reasoning as before, and assuming that there has been no change in the method of treating the water, which I believe to be the fact, that there has beeen no essential change in the treating of the water, the 3939 typhoid fever death rate of the city of St. Louis for the years 1900, 1901 and 1902, is of such a character as in the absence of any evidence of any other factors of its increase, than the change produced in the water supply at the chain of rocks by the opening of the Chicago drainage canal, as to place the said water supply under the gravest suspicion of contamination, to tend to remove it from the class of cities having good water supplies, and to place it in or near the class having polluted water supplies. This is particularly the case in 1901 and 1902, both of which years showed a considerably higher mortality percentage from typhoid fever than the year 1900, and one of which, namely, the typhoid fever record for 1902, belongs clearly in the class of polluted water supplies. I may add that one of the most serious phases of the situation is the fact that the annual increase since the opening of the drainage canal in typhoid fever mortality in St. Louis has been steady, an increase which has as yet shown no signs of cessation.

RE-CROSS-EXAMINATION,

By Judge Johns.

Q. Since your answer to Mr. Hamlin, stating that the expense of filtration of the waters of the St. Louis supply would be probably the same, whether the waters of the Illinois river were added or not, you have been giving that question 3940 considerable thought, have you?

A. Some, yes sir.

Q. You think now that owing to the polluted condition of the water coming from the Illinois river an extremely careful and scientific filtration here would be more expensive because of that condition in the Illinois river?

A. No sir, an extremely careful and well supervised filtration would be expensive anywhere, but what I meant to convey was that in view of the infection that I believe comes from that source, we should have to have here a more careful and expensive system than we would have had to have without it.

Q. While it is evident to your mind that at any time in the last ten years the water supply of St. Louis ought to have been filtered?

A. Broadly speaking I should say "Yes," although as I have just answered a question of Mr. Jeffries, there perhaps have been times when the city did get on remarkably well without it, but I think that it ought to have been filtered even then.

Q. If they ought to have a filter it ought to be managed with great care by good men in any event ought it not?

A. It certainly ought.

Q. If it ought to be conducted by good men with great care under any circumstances, why ought it be conducted by better men with greater care, on account of the Illinois river?

3941 A. Simply because the added danger should require the best care possible, and greater care than would have been required with none of that river.

Q. With typhoid germs coming down the Missouri and the Mississippi river in greater or less amounts and in varying amounts at different times, ought not the keeper of the St. Louis filters, if there were such, to be vigilant and competent at all times?

A. Certainly, but there are degrees in this thing, and inasmuch as they got along very well without such supervision, they might, as our cities are managed in the United States, very likely have somebody who was not thoroughly up to the mark. It is a practical consideration, and if they should have such a person they would get into trouble more than they did formerly.

Q. But assuming it their duty to have good men, exercising great care at all times, if they happen to have bad men exercising small care at some times, that would be their neglect and not the fault of the Illinois river, would it?

A. It certainly would be their fault if they had bad men exercising small care at any time, but that is not the question it seems to me—

Q. Excuse me, it is my question.

A. Well, as I understand—

MR. JEFFRIES: I submit the witness has a right to answer the question. 3942

A. The problem, however, would be more difficult of solution inasmuch as it is one of the fundamental precepts of water purification that a city should obtain the purest raw water possible. It is not merely a matter of skill. It is partly a matter which is outside of skill. Accidents may happen and the best laid filters may occasionally go wrong, even under the best supervision, but of course the best paid manager and the best built filters will be more likely to exclude danger than a worse one.

Q. JUDGE JONES: Assuming that the waters in the Illinois river, which enter the intake at St. Louis, speaking broadly and in a general sense, are as 1 to 16, of all of the water which enters the St. Louis intake and that they do enter the St. Louis intake in a polluted condition. What proportion of the great expense incurred in filtration, should be attributed to the Illinois river?

A. I should find it very difficult to say, but as I said this morning, of course the fact is that a much larger amount than that—

(Question repeated.)

A. I should suppose that would be a matter for a jury to determine, rather than for a sanitary expert.

Q. Well, if you have any opinion as to what proportion
3943 of that expense should be attributed to the waters of the Illinois, state your opinion?

A. I haven't any, at least I haven't anything worth stating in figures.

Q. Assuming that the waters of the Missouri river are sixty per cent, speaking in broad general terms, of the waters which generally enter the intake at St. Louis, and that they are polluted with typhoid germs, and that the waters of the Mississippi river above Grafton are 34 per cent of the remaining 100, and that they are polluted with typhoid germs, and that the waters of the Illinois river are six per cent of the entire 100 and that they are also polluted with typhoid germs, what proportion of the great increased expense of the filterting out of these germs shold be attributed to the Illinois river?

A. I should be unable to answer that question, because it is not merely the removal of typhoid as stated this morning, it

is partly the mere introduction of added filth, and while the mud which came from one river might be more abundant than that from another, the manufacturing waste that came from say the Illinois, might be more serious than that that came from the Missouri or the Mississippi. It is a very complex problem, and when it came down to the actual question of damages, I should think that it would require very serious investiga-
3944 tion. I mean the proposition that it would be an added expense.

Q. If the typhoid germs and the germs of other water-borne diseases were common in the water supply of any city, ought not there be always great care and all the devices known to sanitary science, exercised and used?

A. Certainly.

Q. In the filtering of the waters of that city?

A. I think so sir, yes, undoubtedly.

Q. If the filtration plant of the city of St. Louis was built with a view of excluding from its water supply the germs of water-borne diseases, would it have to be any better or more complex because the supposed mass of water-borne germs was greater or less?

A. I think it would. The larger the number in the river, and the greater the amount of organic matter the more perfect should be the construction of the filter; that is to say, for a water containing a rather low number of pathogenic germs, a more rapid rate, for instance might be used than anyone would dare to use if the water is more heavily contaminated. The filtering bed of sand, if it were a slow-sand filter, ought to be made deeper in case of a river which is rich in infection than in one which is poor in infection. I think it would really practically add to the difficulty of construction and operation.

3945 Q. Then your theory is, that if there are a small number of germs in the water, they are less likely to get through a given filter than if there are a large number of germs thrown into the same filter?

A. Other things equal, yes, and if some should get through from a small number applied, if anything happened to the filter in its ordinary operation, or even if it was working normally, and some had slipped by, the chances of more getting by,—a dangerous number getting by,—from a large dose than a small dose, I think is admitted by all filtration students.

Q. Well if you were endeavoring to exclude by filtration germs from water, your endeavor would be to exclude as far as possible all germs?

A. Certainly all disease germs.

Q. And you wouldn't want to take any chances on that?

A. Certainly not; that is what filters are built for, but we have to take chances; that is to say, even in the best filters there are occasional times when for some unexplained cause there is evidence that a few may get through; no filter is perfect, I think we may say, for very long periods of time, but the number that pass in a well constructed filter, a thoroughly constructed filter, thoroughly up to date and well operated, is extremely small.

3946 On the other hand in inadequate filters and filters that are not well attended to, we have reason to believe that it is largely this factor of safety which is to be taken into account, and the difficulty of operating the filter is universally increased, so it is held by all filtration experts I think, although I do not pretend to be a filtration engineer,—is held to be increased by any marked deterioration in the quality of the water.

Q. In a pure water for a water supply, such a water as being intended for a water supply, would be termed by a sanitarian, pure, there ought not to be bacteria of any kind, disease-bearing or non-disease-bearing, except in very small number?

A. Except in small numbers, and only such as escape from the filter.

Q. Is it necessary to make a different construction of a filter with reference to pathogenic germs than it is for non-pathogenic germs?

A. I don't think anyone ever made a filter for non-pathogenic germs, and I shouldn't suppose that it was, broadly speaking, no.

Q. Now if the Missouri river has twice as many germs in number, bacilli in number, as the Illinois river and Mississippi river combined at the intake, then it would be necessary in filtering against the entrance of those germs to have very great care taken of the waters from the Missouri river, wouldn't it?

3947 A. Assuming that they came in an equal quantity of water, yes, and assuming that all were equally polluted of course.

GENERAL CROW: There is one factor in there that both of you didn't mention. Are you talking of pathogenic or non-pathogenic germs?

A. I understood this to be non-pathogenic.

JUDGE JOHNS: Yes, non-pathogenic germs is what I was talking about.

MR. JEFFRIES: I object to the question as being immaterial.

JUDGE JOHNS: If the Missouri river contains more germs of all kinds than the combined waters of the Mississippi and the Illinois at a given time, and ten times as much of solids in solution and suspension, as the combined waters of the Illinois and the Mississippi at the same time at the intake of the St. Louis waterworks, would it be necessary to filter that water with reference to the Missouri river or with reference to the Mississippi river or with reference to the Illinois river?

A. Well, I don't think that the man in charge would work with reference to either river. He has got to have filters constructed and arranged for all possible waters that may come down. I can conceive of times when it might be more difficult to purify the Missouri than the mixed Mississippi and Illinois, and I can conceive of other times when it might be more difficult to purify the Mississippi and the Illinois than the Missouri, 3948 but in building and operating filters we have got to look at the thing as from year to year and there would be certain seasons, as I testified this morning, when the content of Illinois water in the Mississippi might rise as high as 12 per cent, and at times I suppose, in the near future may rise as high as 25 per cent. Now at a time like that the Missouri must be a comparatively small portion of the whole, because if the Illinois alone is 12 per cent—no, that doesn't necessarily follow, of course it might be or it might not, but at any rate it would be a small per cent, and the thing is apt to be sometimes one way and sometimes another, and you cannot run filters on hypothetical questions.

Q. Well, you can construct filters with reference to conditions, can't you?

A. You have got to construct them with reference to conditions.

Q. Well the conditions being assumed that the Missouri river as to all kinds of bacteria combined and all kinds of solids in suspension and solids in solution, much worse than the combined waters of the Mississippi and the Illinois arriving at the intake of the waters leading to the filter, it would be necessary in the preparation of that filter, to recognize the condition of the Missouri river, wouldn't it, and arrange the filter to filter the waters of the Missouri combined with the other two?

3949 A. Certainly, if that were the fact and if that were the whole fact, but I don't understand that it is.

Q. I am assuming the questions and am responsible for them. If that were the fact then in constructing the filter you would construct it with reference to the very large predominance of the Missouri water requiring filtration, wouldn't you?

A. Certainly if that were the fact and it was so all the time.

Q. So that if that were the fact and it would not be very necessary to provide at a large and great expense, against the filtration of Illinois water in a filter which must be arranged the same, whatever water is to be filtered?

A. Well, if I understand the assumption, and I want to be sure that I do—

Q. (Question repeated.)

A. In reviewing the question I observe that one of the conditions is the combined bacteria of the Missouri river and these might be clearly non-pathogenic for the most part, so that reference would have to be had to the kinds of bacteria delivered by the respective rivers. If the assumption covers that point, then I should answer the question in the affirmative, but practically I believe that the filter would have to be built under local conditions with reference to each of the waters, because at some sea-

sons far more of one is got than of another, and I still cling
3950 to my original statement that the purer the water which
is to be filtered the easier and safer is the process of filtration.

Q. Do you believe because you cannot find pathogenic germs in the water of a running stream that if you attempted to filter such waters, the pathogenic germs would slip through easier than any other time?

A. No, I don't think so, broadly speaking. Some might but I don't think so as a general proposition.

Q. Suppose that a filter was constructed which would at all times and under any circumstances, filter successfully the waters of the Missouri river, wouldn't that filter at all times and under all circumstances filter with equal success, the waters of the Illinois?

GENERAL CROW: I object because it is wholly immaterial for the purposes of this case, and for the reason that the city of St. Louis is not bound to filter its water supply, nor is any other inhabitant of the State of Missouri, to prevent hostile, contagious diseases, by reason of the water being polluted by the respondent.

A. I don't know. I should have to know more about the chemical composition of the waters of the two rivers, at different seasons and times. I should suppose that from a manufacturing city like Chicago, and a place like Peoria, a good deal of manufacturing wastes would come down, and it might even
3951 happen that a water polluted with acid sewage should
issue from the mouth of the Illinois River. Not being sufficiently familiar with the general character of the waters to form an opinion, I should be unable to answer that question. It has been found for example at Worcester, where they are purifying their sewage in order to keep it out of the Blackstone River, to which I referred this morning, that the filtration which they employ has to be of a peculiar kind because of the presence of wastes from the wire works, which make the sewage acid. Now if the material from the stock yards and from the factories of Chicago happened to be of a kind which interfered with filtration as ordinarily conducted, or made it difficult, I can easily

conceive that a filter might have to be differently built than it would if it had just to filter the Missouri River water.

Q. Assuming that the waters of the Missouri River are polluted with acids from Kansas City and other cities upon its banks, having their sewers drained into the Missouri river and that a suppositititious filter erected at St. Louis successfully filtered that water, thus polluted with acid, would not the same filter also successfully filter the waters of the Illinois?

GENERAL CROW: I object to the question because the question as to whether or not a filter that would filter the Missouri River water would also filter the Illinois river water is wholly immaterial and does not tend to prove or disprove
3952 any issue in this case, and for the further reason that the question assumes and asks for an opinion of the witness without stating whether or not the Illinois river and the Missouri river are equally polluted, while the evidence in the case clearly shows that the Illinois river is the more polluted of the two streams.

A. I should have to answer as before, that I don't know because the two waters might or might not be the same in other respects, even if they were the same in respect to acidity, but I do not think that anybody could tell in advance whether a filter that would purify one of them would not also purify the other.

Q. If you as a sanitarian were giving advice as to the kind of a filter that should be used at this point to filter the waters for St. Louis, would you go to Kansas City to determine the kind of sewage which was thrown into the Missouri river from that point?

A. I think I probably should. As a matter of fact of course, I probably shouldn't be put in charge of such an enterprise. It is a little out of my line, but if I were I should certainly go up each stream and see what was put in, for fear that in low water in that particular stream I might get a heavy dose of something that I wasn't aware of at other times. I should depend mainly, however, no doubt, on chemical analyses ex-
3953 tending through years, chemical and bacterial analyses.

Q. Suppose that the chemical analyses of the waters of the Missouri show that it is a polluted stream, you couldn't tell from the chemical analyses what the pollution was?

A. Not what the origin of the pollution was, but one could tell the present state of pollution as to certain points.

Q. You couldn't tell what was the character of the pollution from the chemical analyses?

A. Sometimes we could, but very often not.

Q. More frequently you could not, than that you could?

A. I should say so.

Q. If the bacteriological examination of the waters of the Missouri also showed that it was a sewage polluted stream, you couldn't tell from the bacteriological examination what the character of the sewage pollution was, could you?

A. Not with absolute certainty.

Q. Then that would be equally true of the Mississippi?

A. Yes sir.

Q. And equally true of the Illinois?

A. Yes sir.

Q. If the chemical analyses of the waters of the Missouri river showed that it contained vastly greater amounts of solids in suspension, and in solution, and vastly greater amounts of some chemical constituents injurious of themselves, than 3954 either the Mississippi or the Illinois, and the filter erected here successfully filtered the waters of the Missouri, wouldn't that filter as successfully filter the waters of the Illinois, confining your answer to the consideration of the facts assumed in the question?

GENERAL CROW: The complainant objects for the reason that no defense in this case with reference to pollution and infection of the water supply of the State of Missouri below the mouth of the Illinois, that a filter which would reasonably and safely filter the Missouri river water, would safely filter the water of the Illinois river, is made, and for the further reason that the question doesn't state what kind of matter is supposed to pollute the Missouri river or the Illinois river.

A. Do I understand that the chemical constituents injurious in themselves, are also in the other waters?

JUDGE JOHNS: No, you are not to understand anything more than that the waters of the Illinois, and the chemical constituents of the waters of the Missouri as stated.

(Question repeated.)

A. I couldn't say.

Q. What is your best opinion on that question?

A. I should decline to give an opinion on the conditions stated.

Q. In your remarks upon re-examination this morning, 3955 upon the considerations of the future, did you take into consideration the prospective enormous increase in population of all the other places upon the water-sheds of the Illinois, the Missouri and the Mississippi, or did you consider only the prospective and possible prospective increase in population in Chicago?

A. I intended to take it in all through the valley of the Mississippi and Missouri and Illinois, as well as in the Sanitary District.

Q. Do you conceive that in the future, there might be an increase in the population of the urban cities; that is, the cities having a population of 4,000 and over on the watersheds of the Missouri and the Mississippi and Illinois other than Chicago, in proportion to the increase in Chicago?

A. Approximately I should say, except that Chicago has naturally grown faster and no man can tell whether she is going to outstrip the other cities or not; but I intended to allow a very rapid growth to all the other cities as well as to Chicago.

Q. Do you know whether or not the total increase in population of Chicago upon the basis of the census of 1890 and the census of 1900 is equal to or greater than the total increase in population of all the other cities in the watersheds of the three rivers combined?

A. I do not.

Q. If the population along the banks of the Mississippi 3956 in the cities should increase as you anticipate, and excluding the population of the city of Chicago and its consequent sewage, there might in the future come a time at very low water, when the Mississippi would be almost a river of dilute sewage, might there not?

A. I intended to include that idea in my remarks, yes.

Q. If there was such an increase as I have described, along the banks of the Missouri, this Missouri might at some time in the future become at very low water, simply a stream of dilute sewage?

A. Certainly.

Q. In which case it would be necessary for St. Louis to get its water from the Merrimac, or resort to double filtration?

A. No man can say, but something would have to be done, something serious.

Q. Do you not anticipate that at some time in the future all these things will be changed, and these communities will destroy their sewage at their point of origin?

A. I have often wondered about that and tried to imagine what was likely to happen. As I think I intimated in some part of my testimony, that has been the general line of human progress in the most civilized communities. In England, for example, they are paying more and more attention to the purification of the sewage before they put it into streams, and similar
3957 processes are going on today in the older communities of this country.

Q. If these Utopian ideas in the event of the enormous increase in population should prove to be realities, do you not think then some other inhabitant of Utopia might not also conceive that the sewage would be destroyed?

A. I think such a supposition is not difficult, nor unreasonable.

Q. Do you know that in 1900, when the drainage canal was opened that the waters of the Illinois River were very high?

A. Yes, I was told that it was.

Q. And a very high stage of water?

A. I understood that it was high; I don't remember just how high.

Q. You have been told that after the waters of the drainage canal were poured into the Illinois river in January, 1900, there was an appearance of black water at the intake of the St. Louis waterworks?

A. I have been told and I think I read it also in the evidence in this case.

Q. Did you know anything at the same time with reference to the stage of the Mississippi or the Missouri?

A. I understood that at that time the Missouri was low, or at any rate, that the conditions were such that the mixed Illinois and Mississippi found ready access to the intake.

3958 Q. Did you understand that the Mississippi was high?

A. I understood that the thaw did not extend at that time to the Mississippi, but I do not remember about the height of the water.

Q. You know that for fifteen years prior to 1900 the city of Chicago had been pumping into the Illinois and Michigan Canal the sewage of the City of Chicago from sustantially the same area as it is now pouring in from the drainage canal?

A. I know that there were pumps at Bridgeport, and that when they did not break down, which happened pretty often, they were operated, and that they did lift a large amount of sewage into the Illinois and Michigan Canal.

Q. Well speaking in a broad and general way—

GENERAL CROW: Let the witness finish.

JUDGE JOHNS: I beg your pardon, I thought you had finished.

A. But one of the reasons why typhoid fever was so abundant in Chicago in 1891 and 1892, as nearly as I could discover was that the Bridgeport pumps had been supposed to be out of order a good deal of the time, and there are frequent statements to that effect in the report of the Health Department of the City of Chicago and in the report of the Board of Health of the State, so I have always regarded the Bridgeport pumps as an uncertain element in the matter, but undoubtedly at times they did lift considerable sewage into the Illinois and Michigan Canal. 3959

Q. Did you know the purpose of putting the pumps at Bridgeport was to pump the sewage of the city of Chicago into the Illinois and Michigan Canal from substantially the same area as is now drained by the Sanitary Canal?

A. I have understood so.

Q. What would be the difference in time in your judgment between the flow of water in the Illinois river before 1900, in January and after that time, with reference to the arrival of the waters at its mouth at Grafton?

A. I haven't made any special study of that point, but I should suppose that it would have made a difference of a day or two or something like that. That, however, is largely guess work?

Q. Assuming that the sewage from the city of Chicago poured into the Illinois and Michigan Canal, thence into the Illinois River, would have two more days of time in arriving at the mouth of the river at Grafton, would that two days' time so immensely purify the water that it would be inocuous?

A. I shouldn't expect that, assuming the quantities of sewage to be the same.

Q. Would it be so immensely purified in that lapse of two days as to remove 30 per cent of its dangerous qualities?

A. Assuming that the dangerous qualities were equal in
3960 the two I shouldn't expect that.

Q. Assuming that the dangerous qualities were equal before 1900 and after 1900, would you assume that the lapse of two days' time would remove ten per cent of the danger?

A. I shouldn't make any such assumption because it would be contrary to the facts; that is to say, there would be times when it would be slower in getting here than some time since January 17th, 1900. But there would be other times, when owing to floods it might get here quicker, and I do not think that any accurate comparison can be drawn except on averages for long periods, and I haven't the data to make any such things.

Q. Assuming that all other conditions as to floods, speaking in broad and general terms, were the same before 1900 as after, do you think that the lapse of two days in time would rob the sewage of Chicago of ten per cent of its danger?

GENERAL CROW: I want to interpose a formal objection. I object to this examination because it is wholly foreign to any re-direct examination, because there was nothing said in re-direct examination about the Illinois and Michigan Canal.

A. I don't think that a difference of two days would make any very great difference in the degree of purification under the conditions assumed, or existing, because the two days would be so small a portion of the whole period that if for instance the sewage came down in ten days, two days more would not

3961 make any difference,—certainly would not make very much difference,—in the life of the germs.

Q. Confining your answer to the lapse only of two days' time, you think it wouldn't make much difference?

A. A difference of two days I understood you.

Q. Yes.

A. Much practical difference I mean. Of course there would be more purification in a longer period.

Q. Which one of two individuals, one on the Lake front in Chicago and one on the Illinois River below Joliet, immediately casting dejecta, one into the waters of Lake Michigan and the other into the waters of the Illinois would be most dangerous to the health of the city of St. Louis, if both were typhoid infected persons?

A. Excuse me, before leaving that other subject, I thought you were going on with, I want to say something about the conditions in the Illinois and Michigan Canal.

JUDGE JONES: I have no doubt General Crow will afford you the opportunity.

GENERAL CROW: No sir, I will not. If the Illinois and Michigan Canal were sufficient, they never would have built this one.

Q. (Question repeated.)

3962 A. That means of course at the present time, today.

Q. Under the same existing conditions.

A. I think, other things equal, the one at Joliet.

Q. Assuming that there is what was termed here in your cross-examination a river population of 3,000 people on the Illinois river and its banks between Joliet and Grafton, why isn't their household sewage precisely as injurious to St. Louis as the sewage of the same number of people fishing on the lake front in Chicago, to Chicago?

A. I think it is as dangerous to St. Louis as that is to Chicago. Repeat the question.

Q. (Question repeated.)

A. Largely because St. Louis treats its water and removes a very considerable portion of the microbes by sedimentation, while Chicago takes water unfiltered or un-treated, at the cribs, and I can easily conceive of conditions in which the sewage of the 3,000 people on the lake front might do more harm to the citizens of Chicago than the same amount of sewage from similar persons on the shores of the Illinois to those of St. Louis.

Q. Assuming the conditions of the previous question, why isn't the household sewage of the river population on the Illinois river as dangerous to the waters of the intake tower at St. Louis as the dejecta of the supposed 3,000 fishermen on the lake front of Chicago, is to Chicago?

3963 A. I am not prepared to say that it wouldn't be.

Q. Did you want to be understood this morning as saying that what I have termed river population on the Illinois river, did not cast its sewage into the Illinois river directly?

A. No sir, not if I remember right. I have never denied or failed to believe that there must be a lot of people along the shores of the river, who threw things into the river. I think what I said was that these bore a similar relation to the people behind on the land, as the people on the rivers bore to the people in the cities.

Q. Did you want to be understood this morning as saying that the typhoid deaths or the deaths from typhoid fever, according to the evidence introduced in this case, was double after the opening of the drainage canal to what it was before the drainage canal was opened.

A. In Chicago?

Q. In the Illinois valley?

A. No indeed, I did not so intend to state. What I did intend to say—at least not unless Chicago be considered a part of the Illinois valley. What I did mean to state was this: That for the three years preceding the opening of the drainage canal the total of typhoid fever deaths in or on the watershed above the intake of the St. Louis waterworks, in urban communities, so far as we have been able to discover them, was about 3964 1,100; while owing to the addition of Chicago—the very great addition of Chicago to the watershed on January 17, 1900—the deaths upon the watershed above the intake of the St. Louis waterworks for the three following years was a similar sum (1,100) plus, if I remember right, 1,647. That is to say, this sum (1647) shows the increment in typhoid fever deaths and presumable infection upon the general watershed of the Mississippi River above the Chain of Rocks since January 1, 1900.

Q. Considering that there is substantially the same amount of sewage now coming down the Illinois river, as there was prior to January, 1900, and substantially the same population, urban and rural, on the Illinois river now as before the opening of the drainage canal, using the waters of the Illinois river in substantially the same way and in substantially the same quantities during a period of three years prior to·the opening of the drainage canal and three years after, on your theories as to the increase of typhoid fever, which period should have the greater death rate from typhoid fever, the one for the three years before the opening of the drainage canal or for the three years afterward?

GENERAL CROW: I object to the question because it is ambiguous and it assumes that there was the same amount came down before the opening of the canal as comes now, and for the further reason that it is an assumption that cannot be made applicable to this case under any circumstances.

A. I should say the three years after.

Q. Why?

A. Because, (1) assuming that the same amount of sewage from the same population was pumped in in the old way, through the old Illinois and Michigan canal, it was really a very different sort of sewage. The conditions then existing on the Chicago river were totally different to those that exist today. At that time the Chicago river was a kind of sedimentation basin, and it not infrequently ran in the opposite direction to that which it now takes. It was for the most part a putrescent stream, resembling more or less what we sometimes call a septic tank. And also (2) because in certain places, owing to these facts, there were opportunities for the dying out of typhoid fever germs in that river or its branches, but thirdly, and perhaps chiefly, because the sediment deposited, as I have indicated, was from time to time belched out into the lake as I have said, so that the Chicago water supply was often worse infected than it is today, indicating that the typhoid germs which now very likely

come down to St. Louis, at that time, if alive, went on into the lake much more freely and more readily polluted the water supply of the city of Chicago. To sum up, because the conditions in the Chicago river were so different from those which exist there today, that it is not, in my judgment, diffcult to
3966 explain the facts. I have, of course, thought a great deal about this question, and have endeavored to give it the fairest possible consideration. It is a perfectly natural question which you have asked me, and one that occurred to me long ago, and I have met it to my own satisfaction, studying all the conditions and remembering all the circumstances, and I may say that I believe that the period since the opening of the drainage canal would be far more likely to be the one showing high typhoid fever in St. Louis largely because the typhoid germs formerly held back in the Chicago river, where they either died or were washed out into the lake by heavy rains from time to time, have, since January 17, 1900, for the most part, been sent down the Illinois river, and, although many of them no doubt have disappeared en route, at least for the time being, they have in greater or smaller numbers, nevertheless, survived at other times, and even at some times have reached the intake tower of the St. Louis waterworks and caused typhoid in St. Louis.

Q. Assuming the conditions in the second preceding question, during which period, the three years before or the three years after the opening of the drainage canal, ought the death rate from typhoid fever on the Illinois river below Joliet and to Grafton be the greater?

GENERAL CROW: Complainant objects for the reason, first that the examination could not under any possible
3967 construction be interpreted as being re-cross-examination, and secondly for the reason that it is wholly immaterial and does not tend to prove or disprove any issue in this case, as to whether typhoid fever, under assumed conditions is greater or less on the Illinois river, because the evidence in this case so far has failed to disclose that anyone used the Illinois river water for drinking purposes—of the towns or cities on its banks.

MR. JEFFRIES: And for the further reason that no town or city on the Illinois river is using the water of the Illinois river for its water supply or for drinking purposes.

Q. (Question repeated.)

A. I don't know of any facts which would enable me to answer this question.

JUDGE JOHNS: What was the average flow of the water in the Illinois and Michigan canal for fifteen years prior to January, 1900?

A. I don't know.

Q. What has been the average flow of the waters in the drainage canal since the 17th of January, 1900, per mile?

A. I don't know that. I only know that the amount supposed to be poured down is five thousand cubic feet per second, but what the actual amount poured down has been I don't know.

3965 Q. What was the average rate of flow per mile of the waters in the Illinois and Michigan canal for fifteen years prior to 1900?

A. I don't know.

Q. What is the average rate of flow of the waters in the drainage canal since its opening?

A. I don't know.

RE-CROSS-EXAMINATION, By Mr. Todd.

Q. Professor, in the question put to you by Mr. Jeffries, I believe it was the second, in regard to the years 1895, 1896, 1897, 1898 and 1899, based upon the typhoid conditions in the city of St. Louis, you stated that the water supply from a sanitary point, was good; what did you mean by the word "good" in that sense?

A. I meant that it must have been of such quality as to have probably produced little or no typhoid fever.

Q. Is the word in the sense you used it, safe and drinkable, the word "good"?

A. I should have considered it so in view of the facts.

Q. And you took into consideration all the facts in connection with typhoid for those years, did you?

A. I did. WILLIAM T. SEDGWICK.

ADJOURNED until Monday, 10:00 a. m., May 25, 1903.

3969 Southern Hotel, St. Louis, Missouri. 10:00 A. M., Monday, May 25th, 1903. Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

GARDNER STEWART WILLIAMS,

called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Attorney General Crow, and testified as follows:

Q. Will you please state your name, address and occupation?

A. Gardner Stewart Williams. Ithaca, New York; present occupation Consulting Water Supply and Hydraulic Engineer and professor of experimental hydraulics in the Cornell University.

Q. You gave your residence, did you?

A. I gave my residence, yes.

Q. How long have you been at Cornell University?

A. Since the fall of 1898.

Q. Where were you educated, professor?

A. In the primary grammar and high schools in the state of Michigan, and in the engineering department of the University of Michigan, where I took my degree in 1889. In 1899 I took the advanced degree—

3970 Q. Degree of what?

A. Took the degree of bachelor of science in civil engineering in 1889, and in 1899, the advanced degree of civil engineer, which was awarded to me as a result of my experience and studies in connection with water supplies, particularly from a sanitary standpoint, and the diseases likely—and in relation to the diseases likely to be communicated by them, and upon investigations upon the flow of water. I may say that the results of some of these investigations which were presented to the American Society of Civil Engineers during the past two years, recently received the Normal medal, awarded by that society.

Q. Now, Professor, what experience have you had as an expert on water supplies?

A. I began my experience as a water supply engineer in connection with the construction of the waterworks at Bismarck, North Dakota, where I had charge of the work of getting the intake into the Missouri River; I was then in charge of the construction of the waterworks at Greenville, Michigan, and afterwards at Owasso, Michigan, and in 1893 became the Civil Engineer to the Board of Water Commissioners of the City of Detroit, in which position I had responsible charge of the design and construction of all the engineering work that was done in connection with the plant of the city of Detroit, which was then supplying between 275,000 and 300,000 people, and had a 3971 distribution system of between four and five hundred miles, until the fall of 1898. During that time I was engaged as consulting engineer in connection with numerous other plants and prepared plans and specifications, and had supervision of the construction of works at several other places and since that time have prepared plans and supervised the construction of extensive additions to the waterworks plant at Ithaca, New York.

Q. Well, you are now the consulting engineer, are you, for the water system at Ithaca, New York?

A. I am now consulting engineer of the Ithaca Waterworks Company.

Q. Now you have made the study of water supplies one of your principal occupations, have you, in the last ten years?

A. I have.

Q. Have you anything in the way of an experimental station at Cornell University, that enables you to study flow and action of water on the beds of streams, etc.?

A. The hydraulic laboratory of Cornell University, which has been under my direct charge since the fall of 1898, is by far the most extensive and most noted hydraulic experimental station in the world, and it represents an outlay there of some $50,000, which, were it not for the natural advantages of the location would have cost certainly two or three hundred 3972 thousand dollars. During the time that I have had charge of that laboratory, extensive experiments have been carried on, on the flow of water in open channels, and over dams; part of them for the United States Board of Engineers on Deep Waterways; part of them for the City of New York in connection with their investigations regarding the Croton water supply; part of them in connection with the New York State Canal survey, and we are now engaged upon an extensive series of experiments for the hydrographic department of the United States Geological Survey. In addition to this I may say that a number of less important investigations have been carried on directly as a result of inquiries set on foot by the laboratory itself. During this time I have also been engaged in investigations of the flow of the water at Holyoke, Massachusetts, and at Sault Ste. Marie, Michigan, and in investigations on the discharge of St. Mary's River at Sault Ste. Marie, Michigan. I might also say that during my connection with the Detroit Waterworks, I had occasion to make an extended series of investigations upon the flow in the American Channel of the Detroit river, and have on numerous occasions investigated problems involving stream flow generally.

Q. Generally speaking then, you have a practically equipped channel and streams of water, etc., there at Cornell, with which these hydraulic experiments were made?

3973 A. I have. We were able to produce on the actual scale on which they exist, a very large number of the structures which are met with in the ordinary streams of the United States.

Q. And the apparatus and the streams you have there, and the dams, etc., are used in connection with the instruction which is given to the students under your charge in hydraulic engineering?

A. Both in connection with instruction, and in the line of original investigation, independent of questions of instruction.

Q. Now have you had any experience in the study of epidemics?

A. I have.

Q. Of disease epidemics?

A. As a water supply engineer, I have naturally been interested in any of those and all of those diseases which are influenced by the quality of the water supplies. I have made investigations of typhoid epidemics at Detroit, Michigan, Saginaw, Michigan, Charlevoix, Michigan, Ithaca, New York, and have made an extensive study of the information published in regard to epidemics of water-borne diseases both in this country and abroad.

Q. Then you have made epidemiology another branch of your studies in connection with water supplies?

3974 A. I have to a very considerable extent.

Q. Now, Professor Williams, are you acquainted with the quality of the water supplies of the cities on the Great Lakes of this country?

A. I am.

Q. Did you obtain that information from your own personal observation largely?

A. In a great many cases, very largely.

Q. How does the water supply of Chicago compare with those of the other cities on the Great Lakes?

JUDGE JOHNS: I object because the comparison is not competent or relevant evidence.

A. The water supply of Chicago viewed from a sanitary standpoint is certainly the worst of any supply furnished to a large city on the Great Lakes; in fact, I doubt if there is a supply of any of the smaller towns that has such a continuous reputation for infection.

Q. Explain if you can, the conditions which affect the water supply of Chicago?

A. The water supply of Chicago is drawn from Lake Michigan, through a number of intakes located at various distances from the shore of the lake, which lake has received for a number of years to a large extent, the sewage of the city of Chicago.

This sewage has generally not been discharged directly in-
3975 to the Lake, but into the Chicago river, which in times of
flood has delivered its contents into Lake Michigan with the result that the bottom of the Lake in the vicinity of the outlet of Chicago river and in fact very extensively along the lake shore both ways therefrom, has become covered with accumulations of sewage matter which in times of storm are stirred up and carried out in the lake to the intake cribs. The intakes of the city have been moved to greater distances from shore, but such changes have only afforded temporary relief, and the supply still stands as a seriously infected one.

Q. You have stated that the water supply of Chicago is infected by the sewage of the city. What composes the sewage of Chicago?

A. The sewerage system of Chicago is what is known generally as the combined system; that is, it receives not only the household sewage, but the washings from the streets and all forms of filth from a great city, and so that the sewage is made up of both sorts. The discharges from something like one and three-quarters of a million of people go into the sewers of Chicago, and although a portion of that has recently been diverted by means of the Chicago Drainage Canal, into the Illinois river, there is still being delivered into Lake Michigan the sewage from about one-quarter of a million people.

Q. Professor, can you estimate the amount of human 3976 feces discharged daily into the Chicago sewers?

A. Yes, the amount of human feces daily delivered into the sewers of Chicago is in the neighborhood of 4400 cubic feet. This is considering the fecal matter alone, leaving out other impurities and filth.

Q. Does that relate to the fecal matters as they are suspended in the liquids or water and the urine, or does it relate to the solid substances,—those measurements?

A. That means the solid human feces.

Q. Aside from any liquid mixture?

A. Aside from any liquid mixture.

Q. In tons what would that be?

A. Somewhere in the neighborhood of about 150 tons.

Q. That is every 24 hours?

A. That is every 24 hours.

Q. How does that compare with the suspended solid matters at Lockport?

A. It amounts to something more than 50 per cent of the suspended matter of Lockport, as appears from analyses there.

Q. That is, this 150 tons of human feces amounts to more than fifty per cent—

A. Amounts to more than 50 per cent of the total suspended matters.

Q. You have stated Professor, in your testimony that 3977 a portion of the sewage of Chicago is still delivered into Lake Michigan. What is done with the remainder?

A. The remainder is delivered into the Chicago river and its branches, and from there carried through the Chicago Drainage Canal into the Des Plaines river and thence into the Illinois river and on down that river into the Mississippi.

Q. You have said that the remainder of the sewage of Chicago is mixed with water from Lake Michigan and discharged through the drainage canal into the Des Plaines and Illinois rivers. What can you say as to the quality of the water of Lake Michigan used for this mixture, as compared with that pumped through the intake of the Chicago Waterworks?

A. The water used to dilute this sewage as it is drawn through the drainage canal, is taken from Lake Michigan, near the mouth of Chicago river, and therefore from immediately over these large beds of sewage deposits, which have been found by investigators to be from one to four feet deep in some cases. The condition of Lake Michigan along the docks is such that even today one can hardly fail to see that it is an impure supply. A few years ago, when I was engaged in Chicago in work along the docks, the odors arising from the water even at a considerable distance from the mouth of the Chicago river, were highly offensive, and the suspended matter in the water was such
3978 as to cause light colored substances, dropped into it, to
disappear within a few feet of the surface, whereas in the pure lake Michigan water such as you meet at Mackinaw, such substances can be seen at depths of 20 feet or more. This water becomes clearer as you go from shore, and at the intakes is certainly very much better than that which would be found along the shore, where it is being constantly agitated by the passage of boats, which stir up the deposits on the bottom, and put them in such a condition that they may be readily drawn into the mouth of the Chicago river when the current happens to lead that way. Moreover, the bottom of the Chicago river is also covered with similar deposits and these also are stirred up and carried with the mixing water into the drainage canal.

It therefore is evident that the water taken from along the lake front anywhere in Chicago, will be very much worse from a sanitary standpoint than that taken several miles from shore where the water is very much deeper, and between which places there has been an extensive opportunity for the disappearance of polluting matter.

Q. Assuming then, as you have stated, that the water supplied through the intakes of the Chicago Waterworks, is the principal cause or one of the principal causes, of the high typhoid death rate in Chicago, would not the water used to dilute
the sewage of Chicago and sent into the canal be likely
3979 to carry typhoid infection into the Illinois River water?

A. It certainly would.

Q. Now, Professor, assuming that this water drawn from Lake Michigan at the mouth of the Chicago river, or along the lake front, were delivered un-mixed, with sewage, into a conduit of such capacity and description as to deliver the said water without other mixture, into the Mississippi river at Grafton in the same length of time as the mixed sewage and water is now delivered, would you consider the delivery of such water under such circumstances a menace and danger to the people of Missouri living along the shore of the Mississippi river below the mouth of the Illinois, who might use the waters of the Mississippi river for drinking purposes?

JUDGE JOHNS: The question is objected to as asking for an opinion and not as to the fact, and because further the supposed facts are not relevant to any issue in this case.

A. Speaking generally, I should consider that the discharge of such an infected water as that which would flow into such a conduit from Lake Michigan, near the mouth of the Chicago river, or along the lake front of Chicago, into the Mississippi river, likely to convey disease infection into the Mississippi river at Grafton, and therefore be a menace to the health of people using the water of the Mississippi river below that
point for drinking purposes.

3980 Q. Do you consider the mixture of water and sewage
discharged into the DesPlaines river at Lockport of such
a character as to be safe for use for drinking purposes?

A. Most emphatically I do not.

Q. How is the character of this liquid discharged into the DesPlaines river at Lockport, changed by the time it reaches Grafton on the Mississippi river?

A. It is changed by the dilution with the waters reaching the DesPlaines and the Illinois rivers from other sources, by the effects of sedimentation along the line of the stream and by the action of the vegetation along the same.

Q. What are the physical characteristics of the DesPlaines and the Illinois rivers below Lockport?

A. Below Lockport the DesPlaines river has a rapid fall to Joliet where the slope becomes materially less and lower velocities follow, and the stream then passes on into the Illinois, which is a stream of moderate slope in its upper reaches—

Q. Well, slope where, in the bed of the stream?

A. That is the slope of the water surface from point to point; but as it gets down towards LaSalle, it reaches very flat country where the river partakes quite essentially at times of the nature of an estuary rather than of a river; that is, it is affected extensively by the height of water in the Mississippi. It leaves its banks at a stage a little over
3981 ten feet above ordinary low water, and overflows large areas and flows into bayous, which temporarily store these flood waters and return them to the stream. It is a stream that has wide variations in the amount of its discharge, and the height of the water. For purposes of improving navigation, numerous dams have been constructed across the stream, which being intended solely to store water in times of drouth are not to be considered of the nature of such dams as are built for power purposes, but are in general quite low structures which in times of flood are practically drowned out. The difference in the height of the water surfaces measured from the crests of the dams, in what would be the upper and lower pools, that is the water on the upper side of the dams and that on the lower side, is frequently less than one-half a foot; in fact sometimes as low as two-tenths of a foot, so that in time of high water or even at what might be called moderate stages, boats are able to go over the tops of the dams, rather than having to go through the locks, so that in cases of flood these dams are rather to be looked upon as an obstruction in the bottom of the stream than as dams proper. That is, they partake of the nature and are what are known as submerged weirs under those conditions.

Q. And they were built presumably for the purpose of aiding navigation only?

3982 A. Yes, that is the purpose for which they have been put there and of course as such are only needed in times of low water, as when the water is high, it is sufficient for navigation purposes without the assistance of the dams.

Q. Now, referring, Professor, to the velocity of flow in the so-called lakes near Joliet in the Illinois river, and Peoria, and a portion of the Illinois river where slack water is found, above several dams which exist upon the stream, state whether or not in your opinion, the matter suspended in the water as it flows through the sections of the river referred to, will be deposited at any time upon the bottom?

A. There is no question that under the conditions which exist in those localities where the current is slow, there would be a very extensive deposit of the suspended material in the water, upon the bottom of the stream, at such times as the flow through those portions is low and of a uniform character.

Q. In the event of deposits occurring from the material suspended in the flowing water, explain, please, the process of deposition?

A. As depositions occur in flowing water the heavier materials naturally are deposited first, but it is perhaps a notable phenomena that in a stream of flowing water the pressures existing in the different *layers* of water, if you 3983 may call them so, vary inversely as the velocity. That is, the higher the velocity the less the pressure which the water flowing along is able to exert upon the water adjacent to it. The velocity in streams is ordinarily quite uniform for some distance below the surface so that it is easily possible for the suspended matters to disappear from the surface of the stream and get into the lower layers, but as they approach the bottom the change of velocity becomes much more rapid and hence the increase of pressure from point to point becomes more marked, so that as they approach the bottom of the stream they meet a high resistance in the force of their deposition which results in the accumulation along the bottom of the stream of a layer of water thus highly charged with the suspended matter. In fact when viewed by the eye this may often appear to be an actual deposit lying on the bottom, but as fishermen have frequently observed, if a fish darts through this material, a cloud of dust seemingly is raised in the water. That fish does not go through the deposits on the bottom but through the highly saturated water which lies next to and near to the bottom. Obviously as the pressure varies from top to bottom, a particle in order to settle to the bottom must be of sufficient weight to overcome the difference of pressure from layer to layer .

Q. Of the water?

3984 A. The difference of pressure of the water from layer to layer as it passes downward. Consequently the lighter particles in the water will be the last to be deposited, and we may say that generally speaking the bacteria which are of very nearly the same specific gravity as that of the water itself, will only be borne to the bottom when entangled with the heavier suspended matter, which is finding its way to the bed of the stream. In other words, the mud will be deposited first and the lighter particles, the vegetable and animal particles, later, if at all.

Q. Then, Professor, it would follow, as a result of your statement, in your opinion, that the bacteria contained in the water would be less likely to be deposited than would the inert mineral matter?

A. There is no question about that being the fact.

Q. Would this same thing be true of the very finest kind of clay particles in water?

A. The very fine clay particles would be likely to be carried in suspension for a long time in a stream having an appreciable velocity. They are, however, heavier than the bacteria.

Q. Professor, what effect would the occurrence of higher water in the Desplaines and the Illinois river have upon the deposit of sedimentary material in the bed of the stream?

3985 A. Any condition which tended to change what is called the regimen of flow, that is, which causes a change in the velocities from the bottom to the top of the stream, will cause changes in the amount of deposition, and will also frequently lead to what is known as scouring. It is particularly likely to stir up the suspended matter in the layer of water next to the bottom which is in a very unstable condition, and to distribute that material which in the quiet portions of the stream would be largely made up of the vegetable and animal life in the water, back into the stream.

Q. What evidence is there that this scour you mentioned takes place in the stream?

A. First and probably the most valuable evidence, is the ocular evidence that in times of flood the water in the stream becomes more turbid than that of the water flowing over the surface of the ground into it. That it is an observed fact that rivers dig out again in times of flood the channels which they have previously filled up during low water stages, and if this were not so the rivers would ultimately fill themselves up. And in the case of the Illinois river, the observations of the United States Engineers who have had charge of the improvement of that river, show that there has been no extensive silting up or filling of the channels of the stream, either natural or
3986 artificial. In fact, Mr. Jordan states in a paper which he has recently published that he was remarkably struck with the fact that there was no apparent deposit on the bottom resembling such deposits as would be expected from sewage polluted matter in stagnant waters.

JUDGE JOHNS: I move to exclude the answer, or portion of the answer which pertains to the statements of the United States Engineers and Professor Jordan, as none of those gentlemen are present for cross-examination, and as their statements are not evidence in this case.

MR. TODD: I join in the same objection in behalf of the Sanitary District.

GENERAL CROW: What effect would the presence of the existing dams have upon this scouring action?

A. The effect of dams upon the scour and upon the sediment along the bottom of a stream is very interesting. The currents set up behind the dam tend to cause a rolling over of the particles of the suspended matter in the water, very much as snow drifting against a fence will roll and toss and hence there follows a sorting of the materials, so that behind such dams there will be found accumulations of well-washed, coarse sand and gravel, while the finer particles that formerly existed in deposits of this material have been carried over the dam and sent on down the stream. It is not infrequently the case
3987 that these deposits of sand will be found arranged very much as snowdrifts appear against a tight board fence. This phenomena has been practically made use of in the washing of sands for mechanical purposes, and in fact in the washing

of gold from sands in the old placer mines where the plan was to form a series of dams with blocks nailed across the sluice box, behind which the heavier particles were caught, while the finer and less heavy particles were carried over the blocks and ran to waste at the bottom of the sluice-way. On the down stream side of the dam the water is diverted to the bottom of the stream, so that a very high velocity follows or results in the lower layers of the stream itself, which increases to a very great extent the amount of scouring that would have occurred in these localities had there been any dam present, so that we may say that the dams, except in periods of very low water, are to be regarded as more likely to cause or to assist in the transportation of the suspended matters in the river water than to retard them.

Q. Is it necessary to have a condition of flood waters to take up the suspended matter and move it down from behind the dam?

A. Not at all. In fact, a very small change in the stage of the river at low water time, would make a very decided difference in the transportation of sedimentary matter; even so small a change as might be almost imperceptible on the gauges,—may be accompanied by a considerable disturbance of the matter along the bottom of the stream by reason of the inflow of
3988 water from the surrounding territories, through the ground and into the bed of the stream itself. It is to be borne in mind that in the case of surface streams a large percentage of the water which they carry comes to them not in the visible tributaries over the surface, but rather beneath the surface, and is delivered to them through their banks and through the bottom, so that in the event of even a mild rain-fall which might show itself only in a very limited rise of height of the river, there may be brought to it considerable amounts of water from the surrounding country, delivered in through the bottom, the currents of which would cause considerable disturbance in the very light matter which overlies the sedimentary deposits on the bed of the stream, and which might indeed, and frequently does disturb even the heavier matters that exist along the bottom.

Q. Would the passage of boats have any effect upon the deposits in the bed of the stream, and if so, when?

A. The passage of boats would have a very decided effect in stirring up the deposits along the bed of the stream. This would be not only so in the case of low water, but also in the case of high water. In the first place the churning of the water from the wheels of the boats causes very many eddying currents to reach down into the stream and beyond that, the passage of the boat itself, independent of the disturbance by
3989 the wheels causes changes in the direction of flow in the
water of the stream, such as to lead to considerable re-suspension of the matter deposited on the bottom. During my investigations of the flow of the St. Mary's river I had opportunity to observe the extent to which these variations in the velocity of the stream were felt. There was at that time a channel about 2600 of 2800 feet wide, and through the major part of its extent, the depth was 50 to 56 feet, running down to about twenty feet at the sides. We observed that when a steamer drawing from 14 to 17 feet passed through that channel, the velocities in the stream were disarranged and disturbed for a distance of as much as 100 feet each way from the steamer, and extending clear to the bottom, and that this disturbance continued for sometimes as much as a half an hour after the passage of the steamer, before the water was able again to rearrange itself in the conditions of its normal regimen. All these disturbances change the conditions of velocity and pressure in the different layers of the stream, even at times rendering the pressures sufficiently greater near the bottom to force the material in suspension there into the upper layers of the water. It is also observed that even a boat stationary in a stream causes disturbances of flow which lead to the scouring at the bottom beneath it and at its sides, so that the effect of boats in the
3990 Illinois river cannot fail to be a very important factor
in the disturbance of the sedimentary deposits that may be formed along the bottom both in high and low water.

Q. In what manner did you measure the change of velocity in the flow of the St. Mary's river?

A. The observations were made by means of current-meters.

Q. Well, are they the instruments used by hydraulic engineers for the purpose of determining the speed of the flow and the change of flow in streams?

A. It is the odinary apparatus used for such purposes by hydraulic engineers generally, particularly by the engineers of the United States Government in their investigations of the flow of water in streams, and the measurements of flow in streams.

Q. You mentioned that the passage of boats would cause a change in the velocity. What effect has the change in velocity of a stream as to scouring?

A. Any change of velocity increasing the velocity of flow in the vicinity of the bottom, will lead to scour, or to picking up of particles from the highly loaded layer of water next to the bottom. This becomes more effective when these currents are in the nature of eddies, when they tend to bore or cut into the material on the bottom of the stream. In the case of the formation of eddies, as frequently occurs, when
3991 boats pass at rapid rates through water-ways, or when
they are propelled by wheels of any sort, the disturbance at the bottom is very great and may frequently be observed by the clouds of sediment which are brought up at the stern of the boat, or in the vicinity of its driving wheel.

Q. Does the displacement of water cause a change in the flow of it?

A. Certainly. If water is displaced it has to go somewhere, and if a boat is moving through it, the water has to pass from in front of the boat around and behind it; consequently there are considerable changes in the distribution of the velocities through a stream which I previously explained.

Q. Does a change of the flow of the water diminish or increase the velocity or change it?

A. The velocity must necessarily be increased in the case of still water or water flowing in the opposite direction to that in which the boat is moving, consequently there is a likelihood of scour taking place in that portion of the water which is directly below the boat at any given time.

Q. Professor, what portions of the sedimentary deposits would be first picked up by the water in times of flood?

A. The particles which would be first picked up in times of flood would be those in the layers of water over-lying the bed of the stream, or in other words, those which were last laid

down. The lighter particles of the suspended matter in
3992 the water and the lighter particles of the matter lying
actually on the bed of the stream.

Q. Now, you have spoken of disturbances caused by boats. Might winds cause any similar disturbances or effects?

A. Winds are very likely to cause similar disturbances. In fact, most always do. It has been observed on the Great Lakes, particularly Lake Erie, that after heavy winds, the waters of the lake are charged with greatly increased numbers of bacteria, such as are found in the bottom of the lake and as are not ordinarily found in the water near the top. I have also myself observed that winds have a very decided effect in stirring up the bottoms of ordinarily quiescent bodies of water, even when the depths are very considerable.

MR. TODD: I move to strike out that part of the answer which begins with the words "it has been observed," as not based upon any personal knowledge of the witness, and is therefore not competent.

GENERAL CROW: Now, Professor, you stated that in times of flood or in case of the disturbance of the waters, that the lighter particles would be picked up first in a scouring process, or in a process of removal of sedimentary matter, then what would you say as to the relative transmission during such periods of disturbance of the water, of bacteria and ordinary particles of mineral matter?

A. I should say that the bacteria at such times would be
3993 much more likely to be re-suspended, and when re-suspended, would be carried much farther than would the particles of mineral matter. The latter being heavier would sooner redeposit on the bed of the stream.

Q. Mr. Williams, what would become of the bacteria thus stirred up?

A. In the case of the Illinois river?

Q. Yes, and in streams?

A. They would be carried on down stream. They might be in part redeposited some place in the course of the flow, but some of them would undoubtedly be carried for very long distances in the water and in the case of the Illinois river would be discharged into the Mississippi river.

Q. Do you consider, Mr. Williams, that germs of typhoid fever coming from the sewers of Chicago and passing by way of the drainage canal into the Desplaines and Illinois rivers, that might be deposited in the bed of these streams and remain there for considerable periods, would be entirely destroyed?

A. That of course would depend upon the length of time which the bacteria might remain deposited in the bed of the stream, but under such conditions as existed upon the Desplaines and Illinois rivers, receiving the sewage of the city of Chicago, I see no reason to believe that germs deposited in the bottom of the stream would be destroyed under existing circumstances.

3994 Q. Mr. Williams, do you consider it possible that the water of the Illinois river in times of flood might contain as a result of a scouring action upon the deposits in the bed of the stream more infectious and dangerous material than that ordinarily present in the diluted sewage entering the Desplaines river at the Bear Trap Dam at the foot of the Drainage Canal?

A. It seems entirely possible that as a result of the scouring action set up upon the bottoms of the slack water portions of the Illinois river, the water in times of flood might be more heavily charged with polluted and infectious matter than is the dilute sewage delivered into the Desplaines river at the Bear Trap Dam.

Q. How much of a rise of water would you consider necessary to produce a scouring of the sedimentary deposits in the Illinois river?

A. If water were just flowing over the tops of the dams I should consider that a rise of half a foot would be sufficient to set up an appreciable scour and in many places on the stream a rise of very much less than this would undoubtedly change the conditions of equilibrium along the bottom and cause the re-suspension of previously deposited matter.

Q. Why?

A. Because as already explained a change in the quantity of water flowing down stream is accompanied by a change in the arrangement of the velocities in the stream and hence
3995 by a change in the pressures existing throughout, all of which tended to disturb the equilibruim of the water and

the material suspended in it and also of the material lying on the bottom adjacent to the flowing water, which would therefore be picked up from time to time and re-distributed throughout the body of the stream. In addition to this the increase of depth would cause a much larger quantity of water to be delivered over the dams, and the effects of the scour below the dams would become much more extensive than previously existed.

Q. Mr. Williams, have you made any estimate of the length of time required for the passage of water under existing conditions from the Bear Trap Dam at Lockport to the mouth of the Illinois River?

A. I have, and it appears that we may expect the water to travel this distance under the different conditions existing in the stream in from one to three weeks, speaking generally.

Q. Have you made any estimate as to the number of days in the year 1900, say, in which the water coming over the Bear Trap Dam at Lockport would reach the mouth of the Illinois river within say, fifteen days or less time?

A. I estimate that in 1900, during something over three hundred days, water would have flowed from the Bear Trap Dam to the mouth of the Illinois River in less than 15 days.

3996 Q. Mr. Williams, what effect upon the quality of the water in the Mississippi River at Grafton, Illinois, has a discharge into it of the Illinois river, after the latter river has received the mixture of Chicago sewage and water at Lockport?

A. It tends to increase the pollution and infection of the water of the Mississippi river and render it less safe for use for drinking and general household purposes below the mouth of the Illinois river.

Q. Mr. Williams, when the Mississippi River is in flood and the flow in the Illinois River not above normal do you consider it possible for the two waters to become so mixed as to affect the quality of the water upon the Missouri shore of the Mississippi river?

A. I do.

Q. Please explain how this mixing would take place.

A. That brings us back to the question again of the dis-

tribution of velocities and the distribution of pressure. I have already said that the swifter flowing water transmits less pressure to the water adjacent to it, and consequently the Illinois river entering the Mississippi at a lower velocity than the Mississippi itself is flowing, the waters of the Illinois would be drawn, or forced,as you may choose, to mingle with the Mississippi River, just as we are enabled to pump water by means of the jet pump, where we deliver a jet of water through a channel
at high velocity and that entrains with it slower moving
3997 water at its side and carries it out of the place where
it originally was. We may perhaps place this in more popular language by saying that the swifter moving stream, exerts a suction upon the water of the slower moving stream, which leads to the dissemination and mixing of the latter throughout the volume of the former.

Q. Mr. Williams, would the mixture occur when the Illinois river was in flood and the Mississippi river low?

A. Yes, to a more considerable extent than would occur in the other case.

Q. Why?

A. By reason of the velocity of the Illinois river, the momentum of the particles delivered into the Mississippi would be such as to carry them well out into the stream. In fact it is observed that when the Illinois river is in flood, the waters do pass well out into the main stream of the river.

Q. Of the Mississippi river?

A. Of the Mississippi river, and that an extensive mixing is ocularly evident.

. MR. TODD: I move to strike out the latter part of the answer beginning with "it is observable" as not based upon any personal knowledge of the witness.

A. I may add that I have frequently observed this phenomenon at my old home where the Cass, Shiawassee and the
Tittabawassee rivers unite to form the Saginaw. The
3998 Tittabawassee is a highly muddy stream, while the other
two are rather dark colored and in times of flood I have often observed as I have been boating on the river that when the Tittabawassee was high, her current was disseminated widely through the river. In fact, reaching clear across to the oppo-

site shore a very short distance below the mouth of the other stream.

MR. TODD: I also move to strike out the latter part of the answer as the same furnishes no parallel to the conditions existing between the Illinois and the Mississippi rivers in this case.

ADJOURNED until 2:00 P. M. same day.

3999 Southern Hotel, St. Louis, Missouri. 2:00 P. M., Monday, May 25, 1903. Parties met pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

GARDNER STEWART WILLIAMS,

resumed the stand for further direct examination by Attorney General Crow and testified as follows:

Q. Now, Professor, what effect would the backing up of the water in the Illinois river by higher water in the Mississippi river, have upon the mixing of the waters of the Illinois and the Mississippi?

A. The backing up of the Mississippi water into the Illinois River would have the effect of producing a quite thorough mixture of the waters of the Illinois and so much of the Mississippi as backed up into the stream, and as the flow or effect of this water which had been stored in the Illinois, considering it as an estuary, as it came out of the Illinois, would have the same effect as a flood rising in the Illinois itself, and producing an effect of additional scour on the bottom of the
stream, and carrying the water into the Mississippi, which
4000 then being flowing rapidly, would have the mixed water
more generally disseminated throughout the main current than would be the case with the rising river.

Q. Mr. Williams, are you prepared to state positively that at times the waters of the Illinois river reach the intake of the St. Louis waterworks at the chain of rocks?

A. I am.

Q. Mr. Williams, supposing all disease germs and infectious matter in the diluted sewage of Chicago as it passes Lockport, should be rendered or become inocuous, at and from that point, would you then consider the discharge of the waters of the drainage canal into the Illinois River in any way dangerous to the health of the people of Missouri using the water of the Mississippi river for drinking purposes, below the mouth of the Illinois River?

A. Even under such circumstances I should consider that the discharge into the Illinois river of the quantity of water now delivered through the Chicago Drainage Canal, would be a menace to the health of the people of Missouri using the water of the Mississippi river below the mouth of the Illinois, for drinking purposes, for the reason that this quantity of water added to the stream during the low water periods tends to materially decrease the time required for the flow of the water from various points along the Illinois river, where pollu-
4001 tion and infection may be and are added to the stream,
and thereby increase the liability of such pollution and infection reaching the Mississippi river in condition to do injury and harm to the citizens of Missouri who may be using the water.

Q. Mr. Williams, what do you estimate, if you have made any estimates at all, to be the length of time required for the water to travel from Lockport to the intake tower of the St. Louis waterworks, at the chain of rocks?

A. I have made quite careful estimates of the time probably required for water to travel from Lockport to the intake tower of the St. Louis waterworks, and it is my conclusion that under the conditions existing since the opening of the drainage canal that such water during something over 300 days in the year would reach the intakes of the St. Louis waterworks in from nine to fifteen days of the time that it left the Bear Trap Dam; that a portion of the infection contributed, or of the water added to the Illinois River at the Bear Trap Dam, flowing in the less rapid portions of the stream might be delayed considerably beyond this time, but that it is quite certain that a considerable amount of the mixed water and sewage of Chicago would reach the Mississippi river at the chain of rocks within the period which I have mentioned, during, as I have stated, over 300 days in the year. In fact it appears that since

the opening of the drainage canal, during from 60 to 90
4002 days in the year—

Q. Each year?

A. Each year, the water of the Chicago Drainage Canal would probably arrive in the Mississippi river at the Chain of rocks within ten days of the time that it passed over or through the Bear Trap dam.

Q. Now Mr. Williams, in making this estimate you used the proper methods that are used by hydraulic engineers in estimating the flow of streams?

A. I did, to the best of my ability.

MR. TODD: I object to that question on the ground that it is leading.

GENERAL CROW: Anything else?

MR. TODD: That's all.

Q. GENERAL CROW: Now Mr. Williams, considering the suspended matters in the diluted sewage at Lockport, the quantities of water flowing in the drainage canal and in the Desplaines and the Illinois Rivers, and the Mississippi river, I will ask you to state if you have been able to find the probable average dilution and probable range of dilution of the suspended matter in the water of the Mississippi river flowing past the chain of rocks?

A. I have made computations upon such a basis, and find
that during about seven months in the year, the dilution
4003 of the suspended matters in the diluted Chicago sewage
delivered into the Desplaines river at the Bear Trap Dam, when the said sewage and water reaches the Mississippi river at the chain of rocks, would be from one-half to one part per million, and that in the case of very low water in the Mississippi River the dilution might be reduced so that the suspended matter would represent a dilution of only one and three-fourths parts per million.

Q. By range of dilution of suspended matter in the water of the Mississippi, flowing past the chain of rocks, you mean the amount of dilution in proportion to the volume of the water in the Mississippi river at the chain of rocks?

MR. TODD: I object to that on the ground that it is leading.

A. I mean that the ratio of the amount of suspended matter delivered into the Desplaines river from the Chicago drainage canal at Lockport, and the quantity of water flowing in the Mississippi river, is as from five-tenths to one part of the suspended matter, to one million parts of the water of the Mississippi river, and that in time of low water this ratio may be one and three-fourths parts of the suspended matter to one million parts of the water of the Mississippi river.

Q. Now, Professor, I will get you to state whether or not this suspended matter refers to the sewage in the liquid form and in the form of feces or does it refer to the solid matter in the sewage, excluding any liquid substances or matters that might be in the sewage from the drainage canal?

4004 A. This is based upon the solids which are in suspension in the sewage at the Bear Trap Dam, and has no bearing upon any substances which may be in solution and therefore not appearing as solids in suspension, in the analyses of the water.

Q. Mr. Williams, do you know of any case where a similarly diluted mixture of suspended solids from sewage matter has produced typhoid fever?

A. I do, at Detroit, in 1892.

Q. Will you please briefly describe the circumstances of that epidemic and the conditions involved in it, and which led up to it. If you have personal knowledge of those facts, please state that.

A. I have personal knowledge of the facts in question, inasmuch as I investigated the outbreak of typhoid fever in Detroit which followed the occurrence to which I have reference.

The water supply of the city of Detroit is drawn from the American Channel of the Detroit River, at the head of the river or at the foot of Lake St. Clair. Detroit river as you know, is one of the links in the connecting waters between the upper lakes, Huron, Michigan and Superior, and the lower lakes, Erie and Ontario, and is the natural outlet of the upper Great Lakes to the sea. The water from Lake Huron enters the St. Clair river and flows through it a distance of about 35 miles, to the delta of the St. Clair river, when it

4005 discharges into Lake St. Clair. Lake St. Clair is nearly circular in form, being 24 miles wide and including its delta, about 24 miles in length, measured in the direction of flow. The water supply of Detroit is taken practically from the lake, or from the river a few hundred feet below the point where it takes its origin in Lake St. Clair.

In the year 1890, the number of deaths in the city of Detroit from typhoid fever, were 39; in the year 1892 the number of deaths from typhoid fever in the city of Detroit, were 209. This remarkable increase was such as to cause Detroit for that year to take rank among those cities which have had the highest death rates from typhoid fever in America,—there are but one or two of our large cities that have had death rates notably higher than this; one of them being Chicago. An examination of the records showed that this epidemic begun in June, during which month there were 38 deaths by typhoid fever. As the Civil Engineer to the Board of Water Commissioners of Detroit, it was very natural that my attention should be called to this condition of affairs, as many people attributed the cause of the epidemic to the water supply and I started to ascertain, if it were possible, where such a remarkable infection could have come from so suddenly and so unexpectedly. After an extended investigation I found that the epidemic was undoubtedly caused as a result of improvements to the channel of Black River which flows into St.
4006 Clair river near its head, at Port Huron, a distance of about 57 miles from the intake of the Detroit Waterworks. I found that Black River which was a sluggish stream, having ordinarily no current whatever, and only in times of heavy rains a perceptible current, had been for years receiving the sewage from the city of Port Huron, through the center of which it flows. In order to improve the harbor of Port Huron, which was virtually the lower portion of Black River, the United States Government had caused the river to be dredged during the early months of 1892, and in the process of that dredging, had removed deposits from near the mouths of the sewers, which ranged in depth from a foot to seven or eight feet, and, according to the testimony of some of those who lived along the banks, to as much as ten feet in depth. This material was

loaded upon scows and transported out into the St. Clair river, where it was discharged or dumped into the stream, at a point as I have already stated, about 57 miles above the intake of the Detroit Waterworks. I found upon further investigation that this work had been begun during 1891, and that conditions were such that this particularly highly infectious deposit of material was reached right at the beginning of the operations in 1892, so that this fully explained the sudden out-break of typhoid fever in Detroit, it having been carried through the
4007 water of the St.Clair River, and through Lake St. Clair, to
the intakes of the Detroit waterworks, and thence distributed to the consumers throughout the city, with the result above mentioned.

MR. TODD: I move in behalf of the Sanitary District to exclude all of that part of the answer beginning with the expression "from the examination of the records" as being based upon hearsay and not personal knowledge, and the conclusions made by the witness from the facts as stated, as not being competent evidence in the case.

Q. Mr. Williams, do you know the amount of material that was dumped into the St. Clair river at that place?

A. I do.

Q. Professor Williams, do you know the depth of the St. Clair river at the place where this dumping was done?

A. St. Clair river at the point where this material was dumped was about 1800 feet wide, and from 30 to 36 feet deep.

Q. Mr. Williams, if I understand you the St. Clair river flows into St. Clair Lake, is that correct?

A. That is correct.

Q. Now what did you say was the size of St. Clair Lake?

A. About 24 miles wide and 24 miles long, including the delta at the head of it.

Q. Now Mr. Williams, do you know aside from the delta
4008 portion of the lake, what is the average depth of St.
Clair Lake?

A. About sixteen feet at that stage of water.

Q. Now Mr. Williams, do you know whether or not the current in the St. Clair lake is perceptible to the human eye?

A. It is not. The St. Clair river, while quite a swift flowing stream, discharges into Lake St. Clair over a delta which spreads out for about 130 degrees, has ten distinct mouths, and the distance between the extreme mouths measured along the arc of the delta is about 20 miles. This delta portion is quite shallow in places; sometimes not more than a foot deep, other times running down in the channels to a depth of 15 or 16 feet. It is covered in the shallower portions and often in the channels, with a very heavy vegetable growth, and reeds growing up out of the water in a great many places. It is one of the most remarkable fishing grounds, I may state incidentally, that there is along the Great Lakes.

Q. What is the character of the water of Lake St. Clair as to whether it is muddy or clear?

A. The water of Lake St. Clair is a clear water under ordinary conditions, and except in times of storm when the winds churn it up, it is an entirely satisfactory water for drinking purposes without anything in the nature of treatment or clarification.

4009 Q. Mr. Williams, have you any knowledge as to the speed of flow from the St. Clair River in the lake and through the lake and into the Detroit River, if there is any such flow?

A. Yes, the velocities in the St. Clair river range from about three and three-fourths miles per hour down to about 1.8 miles per hour. In the delta portions, the highest velocities that have been measured, which are in the main channels there, are a little less than one-quarter of a mile per hour; that is one mile in four hours.

Q. How much is in the delta?

A. There is about seven miles of delta.

Q. Now what about the velocity in the lake?

A. In the lake the velocity ranges from about .06 of a mile per hour—that is one mile in about 16 or 17 hours, to about one-twelfth of a mile per hour; that is one mile in twelve hours.

JUDGE JOHNS: When you get through with the testimony in regard to Lake St. Clair I want to move to exclude all the testimony, descriptive of Lake St. Clair, and its waters, as irrelevant and incompetent both.

Q. GENERAL CROW: Mr. Williams, I will get you to state if you know what was the length of time in the case you have mentioned, that probably elapsed between the discharge or dumping of the matter, and the distribution of the 4010 water into which said material was dumped, to the consumers of water in the city of Detroit?

JUDGE JOHNS: The question is objected to as assuming a fact not proved, namely that this matter discharged into Lake St. Clair was distributed to the citizens of Detroit; and also on the ground that there is no proof that the waters into which the matter was dumped, was distributed to the citizens of Detroit.

MR. TODD: I object in behalf of the sanitary district on the ground that there is no legal evidence in this case showing that any matter of any kind was dumped, as included in the question, and that the witness has shown no personal knowledge of the existence of such fact, except based upon hearsay.

A. The time elapsing between the deposit of the infectious matter at Port Huron and the arrival of the water into which it was so discharged, and the delivery of the same to the consumers in the city of Detroit, would be the time required for the water to flow from the point in the St. Clair river, where the material was discharged, to the intakes of the Detroit waterworks, and to be distributed through the distribution system of the Detroit Waterworks to the consumers in the said city, and that time I have estimated quite carefully, and find that in all probability it may not have been less than eight days, and that it undoubtedly would have arrived there in 12 to 14 4011 days. I think that ten days is a fair estimate of the time required for the most rapid travel of the water from the vicinity of Black River in Port Huron to the water system, or to the intakes of the Detroit waterworks.

JUDGE JOHNS: I move to exclude that answer as not based upon any evidence yet submitted in this case, and as not based upon the knowledge of the witness.

MR. TODD: I join in the same motion, and for the additional reason that the witness has not shown that he knew when this matter was deposited, of his own personal knowledge, if any such matter was in fact deposited.

Q. Now Mr. Williams, do you know what is the ordinary period of incubation for typhoid fever, after one has taken into the intestinal canal the typhoid bacillus?

A. According to the best evidence which we have it appears that the disease may incubate in as short a time as seven days, or that it may require in the neighborhood of four weeks, but that probably about 75 per cent of the cases will incubate in from ten to fifteen days of the time infection is taken, and I have concluded that twelve days is a reasonable and proper period of incubation to be allowed in the study of typhoid epidemics.

MR. TODD: I object to the answer on behalf of the Sanitary District, on the ground that the witness has not 4012 shown any qualifications that will enable him to answer this question.

GENERAL CROW: Now Mr. Williams, considering the relation of the St. Clair river, St. Clair Lake, the Detroit River and the Detroit waterworks, the location thereof, the speed of flow as you have described the same in the St. Clair River, and down the Detroit River, and the time when the material from the bed of the Black River in front of Port Huron was dumped into River St. Clair, I will get you to state if you know whether or not the typhoid epidemic you have mentioned in 1892, appeared in the city of Detroit within a reasonable period of incubation thereafter, or after the water from the point where the material above mentioned was dumped into the St. Clair river, may have reached or should have reached the consumers in Detroit?

MR. TODD: I object to the question on the ground that the facts assumed in the question have not been established.

GENERAL CROW: I have not assumed any facts.

MR. TODD: You assumed the dumping in.

GENERAL CROW: No I didn't. I said considering the facts.

Q. (Question repeated).

MR. TODD: I object to the question on the ground that there is no evidence that the witness has shown that he has a personal knowledge of any material having been dumped into St. Clair River as stated in the question, and that that fact has not been established by any competent evidence.

4013 A. I found that making the allowances already stated for the time required for the infection to come from the point at Port Huron where this material was discharged into the St. Clair river to the consumers of water in the city of Detroit, and allowing the average period of incubation for typhoid fever, and allowing the ordinary time to elapse between the taking down of the patient and the occurrence of death in the event of death occurring, that the sum of such times agreed within 24 hours with the time which had elapsed from the deposit of the dredged material from Black river into the St. Clair river, and the time when there were in a single day in Detroit four deaths from typhoid fever, there having been only one in the preceding twenty-four days.

MR. TODD: I move to strike out the answer because the witness has not shown that he is in possession of facts of personal knowledge sufficient to make the answer that he has made.

JUDGE JOHNS: I move to strike out all the witness' testimony in which there is a description of the river St. Clair, Lake St. Clair and the Detroit River, as irrelevant and incompetent testimony.

GENERAL CROW: Now, Mr. Williams, you say that this water coming into the intake of the Detroit waterworks had passed through Lake St. Clair a distance of some seventeen miles, and at the latter end of its journey,—now wasn't 4014 it probable that it might have flowed through this Lake St. Clair in a direct line at considerable velocity and thereby have reached the intakes of the Detroit Waterworks in a much shorter time than you have mentioned?

A. That would have been impossible from the formation and form of the delta, and also from the fact that there is at no place in Lake St. Clair, or was no place in Lake St. Clair any perceptible current through it, but that the water flowing into it was distributed throughout its whole upper end and must therefore have passed by very slow stages, through the lake and out of the outlet at the lower end.

Q. What was the estimate, if you know, of the discharge or volume of water by the St. Clair river at the time of this epidemic of 1892?

A. The discharge of the St. Clair river varies from 180,000 to 200,000 cubic feet per second, and at the time of this epidemic was at about the lower figure, which by way of comparison

I may remark, is about the discharge of the Mississippi river at St. Louis at ordinary stages, that being the discharge of the upper lakes, except such as is taken through the Chicago Drainage Canal.

Q. How is that?

A. I say that discharge represents the discharge of the upper lakes, except such as is taken through the Chicago Drainage Canal.

4015 Q. You mean the discharge of the upper lakes into the sea?

A. Yes, the discharge of the upper lakes into the sea.

Q. Now are you familiar with what is termed slack water?

A. Yes sir.

Q. Well, do you know whether or not the water of Lake St. Clair could be termed slack water?

A. I think it may be termed considerably more than slack water, as it is unless affected by winds, frequently to all intents and purposes, with no wind to disturb it, a quiescent water. It would be impossible to observe any motion of floats put upon its surface, except as they were blown about by the wind. It is nearly as quiescent water as the water of Lake Michigan is, so far as regular currents are concerned, or anything in the nature of flow. As compared with the slack water supposed to exist behind various dams on the Illinois river the velocity in Lake St. Clair is not one-quarter that which exists in the slack water places along the Illinois River.

Q. Mr. Williams, you stated that the intake at Detroit waterworks was located on the American side of the Detroit river, how does the discharge of this channel compare with that through the Canadian Channel if you know?

A. From discharge measurements which I made upon the Detroit River while I was connected with the Detroit

4016 Waterworks—I also made an extended survey of portions of Lake St. Clair above the mouth of the Detroit River, so that I am personally familiar with the conditions that existed, and I frequently passed through the channels connecting Lake St. Clair with the St. Clair river, and up the St. Clair River to Port Huron, so that I am personally acquainted with the conditions that exist along that stream and throughout Lake

St. Clair,—I found the quantity of water discharging through the American channel of the Detroit river, from which the Detroit waterworks takes its supply, was about one-third of the total quantity which is delivered through the river.

Q. Then considering that fact would or would not the Canadian Channel be a more direct outlet for a larger portion of the water of Lake St. Clair that came into the Detroit River?

A. The Canadian channel undoubtedly took the larger portion of the water flowing into Lake St. Clair and still does so, and it is in a more direct line with the main mouth of the St. Clair delta, in fact more than half of the mouth of the St. Clair delta, discharging in such a way as to indicate that the water transmitted would be more likely to pass down the Canadian channel than down the American channel.

Q. Mr. Williams; was the effect of the infection of the water of the St. Clair river and the Detroit river in 1892, felt in any other cities along the St. Clair and Detroit Rivers other
4017 than the city of Detroit?

JUDGE JOHNS: I object to it as irrelevant and incompetent.

A. The presence of infectious matter in the water of the Detroit River was indicated by a largely increased prevalence of typhoid fever in all the towns along the St. Clair and Detroit rivers which had public water supplies taken from the Detroit and St. Clair rivers.

Q. I will get you to state if you know, what was the dilution of the matter taken from the Black river and dumped into the St. Clair river in 1892, and what was the character of that material which was removed, if you know, from the Black River at Port Huron?

JUDGE JOHNS: Objected to as incompetent and irrelevant.

A. Estimating the quantity of dilution from the discharge of the St. Clair river as determined by the readings of the gauges maintained by the United States corps of engineers along said stream at the time when the work at Port Huron was in progress, and by the number of cubic yards of dredged material as shown by the books of the inspector who had charge of that dredging, now on file in the office of the engineer corps of Detroit, which I have personally inspected and examined, I find that during the month of April, 1892, the ratio of the volume of dredged material discharged per day into the St. Clair River at Port Huron, 4018 to the volume of water flowing in the said river for twenty-four hours, based upon the above data, ranged from a ratio of .55 of a part of dredged material to 1,000,000 parts of water, to 1.1 of dredged material, to 1,000,000 parts of water.

MR. TODD: I want to object to the question on the grounds that I have stated in the objections to the other questions.

Q. (Question repeated.)

A. The materials dredged were composed of deposits of silt and sediment apparently coming from the sewers of Port Huron near the mouths of which it lay, having been protected from disturbances there by the piers of a bridge near by, and according to the statements in the book of the inspector who had charge of the dredging, which I have personally examined, amounting to about seven feet in depth, and below that the material was a clay—colored by the sediment, and in some places mixed with sand.

MR. TODD: I move to strike out the answer for the reason that the records as contained in the books of the inspector are not evidence of themselves, not competent and the fact that the witness examined the records doesn't make them competent for him to testify to, and for the further reason that the witness has not shown that he has such knowledge of the facts as to make his evidence competent upon the questions he is testifying.

4019 JUDGE JOHNS: I join in the objection, and object further that the witness has stated no facts as to the amount of materials dredged which would enable anyone to verify his conclusions.

GENERAL CROW: Q. What, Professor, do you state to be the range of dilution of the sewage matter of Chicago, from the Sanitary District of Chicago, in the waters of the Mississippi river flowing past the chain of rocks?

A. At ordinary stages, from .5 of a part of suspended matter to 1 part of suspended matter in one million parts of water.

Q. How does the dilution in the Detroit case you have mentioned, in the St. Clair river, compare with the usual dilution of the sewage of the Sanitary District at Lockport and also at the Chain of Rocks in the Mississippi river?

JUDGE JOHNS: Object to the question as incompetent.

A. The suspended matters in the sewage and water at Lockport, are something over twenty times as great as I have estimated the suspended matter in the St. Clair river, due to the dredged material at Port Huron, to have been at the time the dredged material was dumped into it, and the suspended matters estimated in the Mississippi River at the Chain of Rocks as coming from the Chicago Drainage Canal, are practically in substantially the same proportion to the quantity of water flowing as those existing in a stream of substantially the same size, in the case of the Detroit typhoid epidemic.

4020 Q. The dilution you mentioned in the Detroit case, was that in Lake St. Clair or St. Clair river?

A. That is estimated upon the discharge of the St. Clair River at Port Huron, the United States gauging station.

Q. Mr. Williams, you have stated heretofore in your examination that there had been dredging done at the mouth of the Black river previous to the spring of 1892, which caused the epidemic in Detroit which you have described. Did that dredging produce any effect upon the amount of typhoid fever in Detroit?

JUDGE JOHNS: Objected to as immaterial and irrelevant.

A. Following the dredging of the bar at the mouth of Black River and the lower portion of Black river in 1891, there was a very decided increase in the typhoid fever deaths in Detroit for the fall months of 1891, which to my mind was undoubtedly very largely due to the said dredging.

Q. Mr. Williams, if you know will you please state for how long a period of time the deposits of sewage which you have mentioned, had been accumulating in the waters and on the bottom of the Black River at Port Huron prior to their removal as detailed by you in 1892?

JUDGE JOHNS: Objected to as incompetent and irrelevant.

A. Those deposits had been accumulating for a number of years.

GENERAL CROW: I will ask you this question. How

4021 do you know that sewage matter was deposited in the Black River in front of Port Huron?

A. I know from personal interviews with the City Engineer of Port Huron that the sewers discharging into the Black river at this point have been constructed and in use for a considerable number of years before he became City Engineer of Port Huron, which was previous to 1892.

Q. I will get you to state if you know whether or not Port Huron had sewers in 1892, and where they discharged?

JUDGE JOHNS: I object to the question as incompetent and immaterial.

A. Port Huron had sewers in 1892, and they did discharge into the Black River.

GENERAL CROW: I will get you to state if you know whether or not there had been typhoid fever in Port Huron preceding the time of the dredging above mentioned in the Black River?

JUDGE JOHNS: Objected to as immaterial.

A. There had been typhoid fever in Port Huron during September and October, 1891, as shown by the records of the State Board of Health of Michigan, which facts have been communicated to me by the secretary thereof.

MR. TODD: I move to strike out the answer as not competent and not relevant.

GENERAL CROW: I will get you to state whether or 4022 not you made any examination to discover whether or not there was any typhoid fever in the territory tributary to the waters of the St. Clair River in the period you have mentioned in 1892 or prior thereto, that might have conveyed infection to the waters and thus been the source of the infection of the water supply of Detroit?

JUDGE JOHNS: I object to it as incompetent and irrelevant.

A. The presence and extent of typhoid fever in the various cities, towns and villages upon the watershed of the St. Clair River, Lake St. Clair and the Detroit River above the intakes of the Detroit waterworks, and of that portion of the shores of Lake Huron adjacent to the head of St. Clair River, was carefully examined into—

Q. By whom?

A. By myself with the cordial assistance of the State Board of Health of Michigan, the Provincial Board of Health of Ontario and by means of special communications to the health officers and physicians in the several localities, and after a most searching investigation and inquiries from private citizens and others familiar with the facts extant, or existing at the time of the epidemic in Detroit, and previous thereto, I was unable to find any source of infection that could in any way account for even
4023 a small portion of the outbreak of typhoid which I have described as occurring in Detroit in the spring or in June of 1892.

GARDNER S. WILLIAMS.

ADJOURNED until 10:00 A. M., Tuesday, May 26, 1903.

4024 Southern Hotel, St. Louis, Missouri, 10:00 a. m. Tuesday, May 26, 1903.

Parties met pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

GARDNER STEWART WILLIAMS

resumed the stand for further direct-examination by Attorney-General Crow and testified as follows:

Q. Mr. Williams, I will ask you if you can state the time when this dredging and dumping was done in the Black and the St. Clair rivers, in 1892?

A. The time when it was done?

Q. Yes?

A. It began April 16th, 1892, and the work continued all through the year, but the dredging of the particularly infectious matter ended in a comparatively short time, a matter of a few weeks.

Q. I will get you to state if you know the amount of material that was dredged out of the Black River and dumped into the St. Clair river at the point you have mentioned?

MR. TODD: The same objection to that question that I
4025 made to the others, namely, because the witness has already testified to the effect, or I mean the testimony of

the witness heretofore given, shows that he has no personal knowledge of the facts about which he is called upon to testify.

JUDGE JOHNS: I object on the part of the State of Illinois to all the testimony with reference to the history of the epidemic at Detroit, as irrelevant and incompetent.

A. The note-book of the inspector who had charge of the dredging in Black River in 1892, as the representative of the United States Board of Engineers on that work, shows on April 16th 327 cubic yards of material dredged and dumped; that there was no further work until the 20th when 548 cubic yards were dredged and dumped; on the 21st, 442 cubic yards,

On the 22nd, the same,
On the 23rd, the same,
No work on the 24th, apparently,
On the 25th, 442 cubic yards,
On the 26th, the same,
On the 27th, 557,
On the 28th, 548,
On the 29th, 442,
On the 30th, 663,

and continuing through the month of May in similar quantities.

MR. TODD: I move to strike out the answer on the 4026 ground that the note-book of the inspector is not competent evidence in this case, and besides, the witness has not shown that he has a personal knowledge of these excavations, as shown in the supposed note-book of the inspector.

Q. GENERAL CROW: Mr. Williams, I will get you to state if you know how this amount of dredged material raised from the Black River and dumped into the St. Clair river, would compare in quantity with the solid fecal matter coming through the out-falls of the Chicago sewers, now, and into the drainage canal every 24 hours?

MR. TODD: The same objection to that question as to the preceding.

JUDGE JOHNS: And the further objection that the comparison is not competent evidence, and the witness has no personal knowledge of the amount of sewage coming from Chicago, as stated in the question.

A. The quantity of the dredged material dumped into the St. Clair river at Port Huron daily in 1892, varies in amount from two to five times the amount of human fecal matter that is delivered by the sewers of Chicago into the Chicago River and thence into the drainage canal each day. I mean by that, that the total amount of dredged matter composed of the sedimentary accumulations from the sewage of Port Huron, which had been accumulating for a number of years, and the material
4027 which was originally part of the bottom, and which was
taken up by the dredges in this work and delivered, mixed with the other material, into the St. Clair river, daily, taken altogether, is in amount from twice to five times the amount of human feces only, which are delivered daily through the sewers of that portion of Chicago discharging its sewage ultimately into the drainage canal.

MR. TODD: I move to strike out the answer for the same reason assigned in the previous motion.

JUDGE JOHNS: I object to the answer for the reason that the year 1892, as to the sewage of Chicago, is not material to any issue in this case.

Q. GENERAL CROW: Mr. Williams, you have stated that you investigated to try and discover if there were any causes for the Detroit typhoid epidemic of 1892, upon the watershed of the Detroit waterworks, other than the pollution of the St. Clair River by dredged sewage deposits from Port Huron. Now I will ask you to state whether or not you made any investigation in the city of Detroit, to determine whether or not any local causes might have existed at or prior to the time of the epidemic that might have produced the same?

A. I did make a most thorough investigation of all possible conditions existing in Detroit, previous to the outbreak and during the existence of the epidemic to ascertain whether
4028 it were possible that the cause of the epidemic might lie
in any such condition, and after the most careful investigation which it was possible for me to make, which included conversations with physicians who treated cases during this epidemic, the studies of rain-fall, general precipitation and temperature of the distribution of the cases throughout the city, with

relation to possible infection from previous cases, and a consideration of all other suggested sources of typhoid infection—it was impossible for me to find any cause which could explain or begin to explain such an outbreak of typhoid as occurred in the month of June, 1892.

MR. TODD: I move to strike out the answer as being incompetent and not responsive.

Q. GENERAL CROW: The cause you refer to, is a local cause, is it?

A. I didn't understand the question.

Q. You stated that you were unable to find any cause for it. You have reference to a local cause?

A. Any local cause, yes sir, or any cause other than the dredging of Black River at Port Huron, and the discharge of the dredged matter into the St. Clair River.

MR. TODD: I move to strike out the answer for the same reason as heretofore stated.

4029 Q. Mr. Williams, do you know whether or not there has been any dredging done in the Black River or St. Clair River, and Lake St. Clair since 1892?

A. There has been considerable dredging done in the Black River, or some dredging done in Black River and considerable in St. Clair River, and in Lake St. Clair, since 1892.

Q. What has been the effect, if any, upon the record of typhoid fever, of this dredging, in the city of Detroit?

A. The years in which dredging has been done in the waters above the intake of the Detroit waterworks, between there and the foot of Lake Huron, have uniformly been years of high typhoid in the city of Detroit; said typhoid making its appearance generally some weeks after the beginning of the dredging, and the excess disappearing shortly after the discontinuance of the dredging, up to the time when the 21-foot channel through Lake St. Clair was completed, at which time the conditions previously existing in that lake were materially changed by providing a channel through the lake leading into the Canadian channel, through which a considerable quantity of the water of the St. Clair River flowed directly.

Q. Was or was not the effect of the channel to divert more water to the Canadian side than had previously flowed there?

A. The effect was to divert more water.

Q. Mr. Williams, do you know of any other instance
4030 where the disturbance and discharge of deposits of sediment from sewers into a running stream, has caused typhoid fever among the users of the water of such a stream?

A. I do.

Q. Please state the circumstances if you know them, in that instance?

JUDGE JOHNS: In order to save the necessity of objections to each question and answer as propounded, the State of Illinois now objects to all testimony to be elicited from this witness with regard to investigations either by himself or other persons, of the cause of typhoid fever, and in any other place than in St. Louis, arising from infection of the waters at the intake at St. Louis, caused by the inflow of drainage from the drainage canal in Chicago, and insists that such testimony is neither competent nor relevant, and desires that this objection shall stand to all such testimony from this witness.

MR. TODD: I wanted to make a motion at the conclusion of the Detroit investigation. I don't know whether you have finished that yet or not.

GENERAL CROW: Yes, we have concluded that.

MR. TODD: On behalf of the Sanitary District I move to exclude all of the evidence in regard to the conditions as testified to by the witness as existing in Detroit and Port Huron in the year 1892.

4031 GENERAL CROW: Please state the circumstances, if you know them, in that instance?

A. The circumstances were these: The main sewer of the town or city of Crookston, in Minnesota, became damaged, so that it failed to discharge the material delivered into it. Temporary repairs—

Q. What was the result of that failure to discharge?

A. This of course led to the accumulation in the sewer of deposits of sewage matter, and to afford a temporary relief, a small connection was made around the break which carried off a portion of the liquid matter of the sewage and discharged it into the Red Lake River, which was the stream into which the

sewage of Crookston was regularly discharged. In the fall
1893, this sewer was repaired, and on November 17th, the sewe
age system of Crookston was flushed of the accumulations whi
had gathered during several months preceding. Typhoid fev
to the extent of about 60 cases had existed in Crookston
October and November, 1893. At the time of the flushing
these sewers, and the consequent delivery of the sedimenta
accumulations from the sewers into the Red Lake River, the riv
was frozen over. The town of Grand Forks, North Dakota,
located about 60 miles by river, below Crookston, on the R
Lake River, or on the Red River. In November, 1893, the
were recorded in Grand Forks, two cases of typhoid fev
4032 and no deaths, and for months preceding, there had be
a very small amount of typhoid fever present or prevale
in Grand Forks.

In December, following the flushing of the sewers at Crook
ton, on November 17th, there were reported 230 cases of typho
fever in Grand Forks, and four deaths.

In January there were reported 712 cases and 52 death
In February, 231 cases and 27 deaths,
In March 46 cases and 11 deaths,
In April, 26 cases and 2 deaths,
In May, 1 case and no death,

showing, apparently, that the epidemic had expended itself b
the close of the month of April, and this appears to include i
the neighborhood of 1,200 cases and nearly 100 deaths, as
result of the flushing of the sewers at Crookston, some sixty mile
up-stream from Grand Forks, which was taking its water su
ply from the river into which these sewage deposits were di
charged.

I may further add that during the following months th
typhoid cases and deaths remained at what might be considere
the ordinary amount prevalent in Grand Forks, namely in Jun
3 cases and no deaths,

July, 2 cases and 1 death,

August, 4 cases, no deaths, these months from June t
4033 August being in 1894.

MR. TODD: On behalf of the Sanitary District of Chi cago, I move to strike out the answer for the reason that the witness has not shown that he had personal knowledge of the facts concerning which he has testified.

Q. GENERAL CROW: I will get you to state, Mr. Williams, if you know whether or not Grand Forks, took its water supply from the river into which the sewage of Crookston was emptied?

A. Grand Forks was taking its water supply, and is still, from the river into which this sewage deposit was discharged.

Q. Mr. Williams, what evidence is there to you, as an expert, or what would be your opinion as an expert, on the facts connected with the Detroit typhoid epidemic, which would bear upon the subject of the mixing of currents of water in flowing streams?

A. The conditions which existed at the time of the discharge of the dredged material from Black River into the St. Clair River, and subsequently thereto, afford very excellent evidence of the thorough mixing of the currents of water in a flowing stream. The St. Clair River is about 30 miles in length from the point where the dredged matter was deposited, to the inlet or head of the delta. It is a moderately straight stream, and of comparatively uniform depth, consequently its flow is
not subjected to nearly as much disturbance as is the water
4034 of the Mississippi River in the course of its flow from
Grafton, the mouth of the Illinois River, to the Chain of Rocks, a distance of approximately the same length, or about 29 miles, yet, although the material dredged from Black River was dumped intermittantly from scows, at a single point in the stream, which was at that point about 1,800 feet wide, and from 30 to 35 feet deep, and was discharging at that time a quantity of water about equal to that which the Mississippi River discharges or delivers past St. Louis in its ordinary stages, nevertheless, by the action of the currents of the river itself, following the well known laws of the flow of water, this material seems to have become so thoroughly mixed with the water in all parts of the St. Clair River, that by the time it reached the head of the delta it was delivered into all parts of Lake St. Clair.

MR. TODD: I move to strike out the answer for the reason that has been given in similar motions, in regard to the Detroit River.

Q. GENERAL CROW: What resemblance, if any, is there between Lake St. Clair and a settling or storage basin for water?

A. Lake St. Clair might be, and has been regarded as an ideal settling basin. When the Detroit waterworks was located at its present situation, a report was made upon the probable quality of water so obtained, by a commission of engineers,
4035 composed of members of the United States Engineer
Corps, and in which they pointed out that in Lake St. Clair, the city of Detroit was provided with a vast sedimentation basin which would add materially to the purity of the water drawn from the river at the point where it was proposed to take it.

MR. TODD: I move to strike out the answer on the ground that if the report was competent evidence of the facts, stated, it would be the best evidence.

Q. GENERAL CROW: Do you know who made this report?

A. My impression is that it was made by General Weitzel, General Comstock and General Greene.

Q. Who were they?

A. They were engineers in the service of the United States, members of the United States Engineer Corps, and General Weitzel and General Comstock both had charge of the improvements of navigation and surveys of the Great Lakes.

Q. Do you know about the date when that report was made by these men?

A. That report was made about 1868 or 1870.

Q. From your knowledge of the facts with reference to the deposits of sewage matter in the Black River at Port Huron, how long, in your opinion, did the infection remain in the sedimentary deposits in front of Port Huron?

MR. TODD: I object to the question for the reasons here-
4036 tofore stated.

A. In consideration of the fact that the most recent known cases of typhoid fever preceding the time of the dredging in the spring of 1892, at Port Huron, were those reported in

September and October, 1891, to the Michigan State Board of Health, and in view of the fact that inquiries of the Board ot Health of Port Huron and of the health officer of said city, and of leading physicians there, failed to establish the existence of typhoid fever in Port Huron subsequent to that time and previous to the beginning of the dredging in the spring of 1892, I am entirely satisfied that some of the infection in the sewage matter dredged in the spring of 1892, had remained or lived in that material for three or four months at least, and I think it entirely probable that much of it had lived a very much longer time.

MR. TODD: I move to strike out the answer in behalf of the Sanitary District, for the reason that the witness has not shown that he has any personal knowledge of any sewage having been dumped into the St. Clair river, and is therefore not qualified to pass an opinion.

Q. GENERAL CROW: From your knowledge of the facts in this matter with reference to the Detroit epidemic and the dumping of the dredged material from the Black River into the St. Clair River, how long, in your opinion, did the typhoid 4037 germs or bacilli live in the water of the St. Clair River, Lake St. Clair and the Detroit River?

MR. TODD: I object to that question for the reasons heretofore stated.

A. The typhoid germs delivered into the St. Clair river at Port Huron must have lived a sufficient length of time to have traveled to Detroit, to have passed through the distribution system of the city and to have been delivered to the consumers, and such time could not, in my opinion, have been less than eight or nine days, and in a great many cases, must have been as much as twelve or fifteen days, or more.

MR. TODD: I move to strike out the answer for the same reasons as heretofore stated.

Q. GENERAL CROW: I will get you to state from your knowledge of conditions as they exist at Detroit, in Lake St. Clair and the St. Clair and the Detroit Rivers at the time mentioned heretofore, if in your opinion these typhoid germs may have lived along the banks of the streams, and on the bottoms of the rivers and lakes, for any considerable time?

MR. TODD: I object to the question for the reasons heretofore stated.

A. From the increase of typhoid fever in Detroit in the early months of 1892, January, February, March and 4038 April as compared with the typhoid prevalent during the corresponding months of previous years, following, as those increases do, the rise of water and increased discharge of the St. Clair river, and corresponding to no discoverable increase of infection from other sources, and being as an examination of the individual cases show, due in the main to infection of the water supply, I am convinced that they were very largely caused by the stirring up of the material on the bottom and sides of the St. Clair river and Lake St. Clair, and at the head of the Detroit River itself, which had come there as a result of the dredging of moderately infected material at the mouth of Black River during the fall of 1891, and had remained on the bottom or in the layer of water adjacent to the bottom during the intervening period.

MR. TODD: I move to strike out the answer for the reason that there is no evidence to show that there was ever any typhoid germs at the bottom of the St. Clair river, and for the reasons mentioned in my previous objection.

Q. Mr. Williams, how does the typhoid infection usually get into the water of streams?

A. Through the sewage discharged into those streams.

Q. Mr. Williams, do you consider it safe in your opinion to permit the discharge of human sewage in the streams of 4039 water which may thereafter be used as a source of water supply, taking this question in its broad outlines?

A. As a broad general proposition, most emphatically I do not.

Q. Mr. Williams, in your opinion will typhoid fever germs discharged from the sewage of Chicago reach, and have they reached, and will they continue to do so, the intake of the St. Louis waterworks at the Chain of Rocks under the conditions of flow in the streams and the drainage canal, uniting the sewers of the Sanitary District of Chicago to the said intake above mentioned?

A. It is my opinion, based upon my knowledge of the transmission of typhoid fever through water, and the conditions which I have found upon investigation to exist along the drainage canal and streams which unite the sewers of Chicago to the intake of the St. Louis waterworks at the Chain of Rocks, and the conditions which have existed in Chicago and in St. Louis prior to and since the opening of the Chicago drainage canal, that typhoid infection or typhoid germs have at times come from Chicago to the intake of the St. Louis waterworks; that they may and will continue at times to do so under the conditions which exist and which may be expected to exist in the streams aforesaid.

Q. Mr. Williams, speaking as a general proposition, what in your judgment and opinion as a water supply engineer
4040 and expert is the best criterion of the sanitary quality of a water supply?

A. The best criterion of the sanitary quality of a water supply that is being used by a community for domestic purposes, is the presence or absence among the users of such supply, of water-borne diseases, of which in this country, typhoid fever is at present the most important.

Q. You have stated in your answer that it depended upon the absence or presence of typhoid fever. I will get you to state in your opinion as an expert, whether the abundance of or the number of cases of typhoid fever or deaths, could have any effect in your judgment, as to the quality of the water supply?

A. The number of cases and the number of deaths from typhoid fever in a community using the water supply under consideration, I should consider the most important evidence to be adduced as bearing upon the sanitary quality of that supply, and if such a number of cases and deaths in proportion to the population supplied with the water in question were above the corresponding number of cases and deaths usually occurring in communities known to have pure or high-grade water supplies, unless it could be shown that such increase was due to sources of infection other than the water supply, I should regard as the best of evidence that the water supply was infected.

4041 Q. Mr. Williams, are you familiar with the typhoid statistics of the city of St. Louis for the past eight or ten years?

A. I am.

Q. Mr. Williams, what would you say of the quality of the St. Louis water as delivered through the waterworks plant to consumers, in the city of St. Louis from 1895 to 1899, inclusive, as judged from the typhoid fever in this city and elsewhere?

A. I should say that the evidence afforded by the typhoid fever statistics of St. Louis for the period mentioned indicates that while the water supply of St. Louis at this time was not ideal, it nevertheless, would compare favorably with that of a very large number of our American cities, and that generally speaking it would entitle the St. Louis water supply to rank with about the second class of American water supplies as water supply experts usually consider them.

Q. Mr. Williams, taking the typhoid fever statistics of the city of St. Louis, as an index of the quality of water supply, what in your opinion has been the character of the water supply of the city of St. Louis since the 17th of January, 1900?

A. Considering the evidence of the typhoid statistics of the city of St. Louis since the beginning of 1900, it appears that up to near the end of January the water supply of St. Louis during the year 1900 must have been about as good as form-
4042 erly, but that about that time there appears to have been
a considerable infection of the supply which has continued to increase from time to time since, with the result that the typhoid statistics show the probable infection of the supply during the year 1902, to have been nearly twice as great as existed on the average from 1895 to 1899 inclusive, and that the rank of the water supply of St. Louis has materially dropped judged by the standard of sanitary purity.

Q. Mr. Williams, have you examined the records of typhoid fever in the cities on the Mississippi, the Illinois and the Missouri rivers outside of the Sanitary District of the city of Chicago?

A. I have so far as they have been presented in connection with this case.

Q. I will get you to state if, in your opinion as an expert you have found anything in those statistics mentioned in you last answer that would account for the large increase of typhoi fever in St. Louis since the 17th of January, 1900?

A. I have not.

Q. I will get you to state if you know when the drainage canal was opened?

A. About the middle of January, 1900. Accurately, January 17th, 1900, I believe.

4043 Q. I will get you to state what, in your opinion as an expert, the discharge of the sewage of the city of Chicago through the drainage canal since January 17th, 1900, has had to do, if anything, with the increase in typhoid fever in the city of St. Louis since January 17th, 1900?

A. Basing my opinion upon the facts brought to light in an extended examination of the conditions which seem to me likely to bear upon the questions involved, it is my judgment that to the discharge of sewage by the sanitary District of Chicago, into the Mississippi River, by means of the Chicago Drainage Canal, the Desplaines and the Illinois Rivers, is attributable, the major part of the increase in typhoid fever, revealed by the typhoid statistics of the city of St. Louis since the beginning of 1900, as compared with the period from 1895 to 1899 inclusive.

Q. Mr. Williams, speaking as an expert on water supply, in your opinion, is the absence of such impurities as can be detected ordinarily by chemical analyses of the water, an indication of the absence of disease-producing infection in such water?

A. It certainly is not.

Q. Now you state that it is not an indication. Is it any evidence whatever to an expert, that a chemical analysis does not dislose the presence of disease producing infection in the water?

4044 A. The fact that the chemical analysis fails to show the presence of disease producing infection, is no evidence to an expert that such infection may not exist in the water in question.

Q. I will get you to state, Mr. Williams, if the chemical analysis is one of the aids that water experts use in determining the quality of water supply?

A. It is. An expert in determining the quality of a water supply avails himself of all the information which he can possibly obtain concerning that supply, and a chemical analysis is a valuable aid in that it may show the presence of substances which would be inimical to the health of persons using the water, but nevertheless should it fail to show the presence of such substances, it would not be safe to assume that they might not be and were not present in the water to a sufficient degree to cause very serious results, if that water were used for drinking purposes.

ADJOURNED until 2:00 P. M. same day.

Southern Hotel, St. Louis, Missouri.
4045 2:00 P. M., Tuesday, May 26, 1903.
Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

GARDNER STEWART WILLIAMS,

resumed the stand for further direct-examination by Attorney General Crow and testified as follows:

Q. Mr. Williams, I will get you to state your opinion as an expert, where chemical analyses disclose impurities in water, is that an indication that the water may probably be polluted with a disease producing infection?

A. When the results of a chemical analysis of a water indicate the presence therein of substances which frequently do have their source in sewage, as a water supply expert I should consider that as highly important testimony as to the probability or possibility of the water containing at times matters which would be deleterious to the health of those who use the water, and in such a case I should make every effort to ascertain positively that such substances did not come from sewage contamination before recommending the water for use as a public supply.

In other words, we may sum up the value of chemical
4046 analyses about as follows: That if it fails to show anything of a deleterious character, it is not to be accepted as evidence of purity: If it does show the presence of substances which are recognized as connected with infectious material, then

it is to be regarded as a valuable indication of the possibility of contamination.

Q. Mr. Williams, you have stated that you do not consider the absence of such impurities in water as are ordinarily detected by chemical analysis, as a sure indication that the water is free of disease producing infection. Now, I will ask you what is your reason for holding that view?

A. My reason for holding to the view that the failure to appear in a chemical analysis of water, on the part of any or all of those substances which are recognized as connected with pollution, is not to be taken as an evidence of purity, is that the infectious quality of the water is dependent not upon its chemical constitutents, but upon the presence therein, generally speaking, of living organisms, which are of such minute character, and may be so few in number, that they are entirely beyond the range of chemical analysis to detect and yet may be there in sufficient quantities to cause very serious results, in the event of such water being used for drinking purposes. This fact was excellently brought out by a series of analyses made of the water of the River Dee, in Scotland, where in bacterial analyses,
4047 simultaneously made, showed the bacterial content of the
water to contain thousands of organisms in a cubic centimeter of water while the chemical analysis was entirely unable to detect the presence of these added microbes.

I may also state as another example, that at the time of the epidemic referred to in the City of Detriot, analyses of the water of the Detriot river were made—

Q. What year?

A. In 1892. Analyses of the water of Detriot River were made by competent and experienced chemists, who were accustomed to making analyses of that water, and therefore thoroughly familiar with its ordinary characteristics, and they expressed themselves as entirely unable to detect in that water any indication of pollution, although the records of the city were showing that a tremendous epidemic of typhoid fever was then existing, due to that water.

JUDGE JOHNS: I move to strike out all of the foregoing answer which refers to the River Dee and to the Detriot epidemic, as not competent, and as an argument in support of the theory on which the answer is based.

MR. TODD: I make the motion in behalf of the Sanitary District, to strike it out on the ground that it is mere hearsay evidence, and not based upon any legal proof of the facts
4048 established in this case.

Q. GENERAL CROW: I will get you to state whether or not you had personal knowledge of the character of the water of the Detroit river which came into the intake tower from Lake St. Clair and the St. Clair river in 1892, as to whether or not it was clear or turbid; that is, its appearance

A. The appearance—

Q. Well, did you have that knowledge?

A. I had that knowledge, as a resident of Detroit, and drinking the water every day.

Q. Well, what was the appearance of the water?

A. The appearance of the water was as usual; that is, there was nothing in it to attract the attention of one who was ordinarily drinking the water. No apparent turbidity that anybody noticed or remarked, or that I noticed or remarked, although I may say that I suffered from one of the most severe attacks of diarrhoea at that time that I ever had in my life, and that nearly all of the men in the office with me were similarly affected, said diarrhoea being undoubtedly due to the infection of the water at that time.

Q. Well, was the water supply of Detroit at that time clear or muddy? That is what I meant?

A. It was clear.

Q. What are the ordinary characteristics of the water
4049 supply of Detriot as to its being muddy or clear?

A. It is a clear supply; very clear.

Q. Well, it is clear lake water, isn't it?

A. Clear lake water; except in rare instances it shows practically no turbidity.

Q. Mr. Williams, would you, as a water supply expert, give me an opinion as to what value you place upon the results of chemical, microscopical and bacterial analyses of water as determining its purity or impurity, for the purpose of drinking water and general primary purposes?

A. I consider that whenever chemical, microscopical or bacterial analysis of the water indicates the presence therein of substances which are known to be related to infectious matter, then it is proper to give to the evidence of those analyses, great weight in estimating the quality of that water and the expert should not recommend such water for use, speaking generally, until he is satisfied that the source of such organisms or such constituents or impurities, is such as to be unlikely to affect the sanitary quality of the water. On the other hand, it is not necessary for the expert to depend, or to require either a chemical or microscopical or bacteriological analysis of water to determine its pollution, if it is possible for him to see polluting matter flowing into it.

Q. Mr. Williams, assuming that the numbers of bacilli coli
communis in the waters of the Illinois River at Grafton are
4050 at intervals, no greater than the numbers contained in it
before the opening of the drainage canal, do you as an expert on water supplies, for cities and towns, consider for that reason that the said water is at all times no more dangerous for drinking purposes than before the opening of the drainage canal on January 17th, 1900?

A. Most certainly I do not.

Q. Mr. Williams, I will ask you as an expert on water supplies for cities and towns, passing your opinion upon the subject broadly, in your judgment, is there any present or impending or future danger to the people of the State of Missouri, using the waters of the Mississippi River below the mouth of the Illinois for drinking purposes, which danger would be due to the discharge of the mixed sewage of the Sanitary District of Chicago and the waters of the drainage canal, into the Illinois river, other than the infection with typhoid fever germs, of the waters of the Mississippi river?

A. In the history of water-borne diseases in America, while typhoid fever plays an important part, it comes far short of playing the entire part. Not only Asiatic cholera, but a large number of our common American diseases are undoubtedly transmitted through the water. Among those germs which have been found to have a considerable length of existence in water, are

the germs of diphtheria, tetanus and anthrax, as well as
4051 a considerable number of germs which are derived from
the diseases of the lower animals.

The germ of anthrax for instance, is capable of producing very serious disease in both man and beast, and there have already occurred in the city of St. Louis cases of anthrax one of which has been traced apparently to the water supply, and the germ of anthrax is reported to have been already found in the waters of the Illinois river. Anthrax is primarily a disease of the lower animals, and in France, where it has been especially prevalent, in some provinces it has been no uncommon thing for ten per cent of the sheep to be destroyed by it in a single year. A peculiarity of anthrax is the remarkable length of life of its spores, or seeds,—whichever you may choose to call them,—in water, they having been known to exist in it not only for months, but for years, and are practically indestructible. Should anthrax be present among cattle which are daily slaughtered in the Chicago Stock Yards, and from them be transmitted by the discharges from the nostrils, mouths or bowels of those cattle, into the sewers of Chicago, there would be no question that the germs of anthrax might easily find a lodging in the people of Missouri with extremely fatal results. The germs of anthrax may not only be taken into the human system and produce disease, by passing into the intestinal tract, but it is also
4052 susceptible of producing disease as a result of inoculation, so that a person bathing in water in which there were present germs of anthrax, if he had on his body any abrasions of the skin, would be particularly liable to receive an infection from anthrax, which might very probably end fatally. It is not an uncommon thing for anthrax to be communicated to those who are handling the skins of animals and who may become scarred or bruised in the course of their occupation.

The germ of anthrax being practically indestructible under ordinary conditions, is frequently conveyed in hides and skins, and in the refuse from leather manufacturing esablishments might easily get into the sewage of the city of Chicago as well as by way of the Stock Yards.

The people of the Stae of Missouri resident in the counties

bordering upon the Mississippi River are largely engaged in stock raising, and in times of drouth, the Mississippi river is practically the only source of water for the stock so raised, and it has come to my knowledge that in such times, this water is carted for many miles from the shores of the Mississippi river to be used by both stock and the human inhabitants of the country adjacent. Should the sewage of Chicago become infected with germs of anthrax, and should those germs be transmitted as they undoubtedly would be, into the waters of the Missisippi,
4053 if the Chicago Drainage Canal continues to discharge the sewage of Chicago into the Desplaines and Illinois rivers, at such times there would be great danger of the occurrence of an epidemic of anthrax not only among the human inhabitants of the State of Missouri, but also among the lower animals using the water. Anthrax is recognized as one of the worst of water-borne diseases with which we have to contend, for the reason that when once it becomes established in a community, it may attack both man and beast, and its eradication can only be accomplished by the absolute destruction of the bodies of animals so infected. It is able to live for long periods of time in the earth, and may thereby be communicated long after the death of the primarily infected animal to other animals grazing over the surface.

I may add further that the disease known commonly as glanders, is also transmitted through water, and that it is not an uncommon disease among the stock of this country at the present time, and the discharge of the sewage of Chicago which is at any time liable to be contaminated by glanders, into the Illinois river, is another source of danger to the inhabitants of Missouri. In fact, as we look into the future and see the probable growth of Chicago both in industries and in population, and the added probability of infection of its sewage due to the more general spread of infectious disease, it seems to
4054 me that the danger impending over the citizens of Missouri as a result of the discharge of the sewage of Chicago through the drainage canal into the waters of the Illinois river, is a most fearful menace to the health and welfare, not only of the citizens of Missouri, but of the citizens of other cities below the mouth of the Illinois river, leaving entirely out of consideration the question of typhoid fever.

MR. TODD: I want to object to the question as to its form and second, I move to strike out the answer as being based largely upon information or upon hearsay evidence and as being incompetent, irrelevant and immaterial.

Q. GENERAL CROW: Mr. Williams, are you acquainted with the disease commonly known as hog cholera?

A. Somewhat.

Q. Has that disease any similarity to typhoid fever in human beings?

A. It is the nearest prototype of typhoid fever that is known among the lower animals. The germ of hog cholera is evidently very closely related to the germ of typhoid fever, and it has been suggested that one germ is but a modification of the other, brought about by reason of its peculiar surroundings.

Q. Will you state if you know whether or not the bacilli of hog cholera can be conveyed by water?

4055 A. The bacilli of hog cholera are conveyed by water in the same manner as the bacilli of typhoid fever are, and as the coli communis is transmitted through water, the three germs appearing to be very closely related.

Q. I will get you to state if you have any knowledge on the subject, what your opinion would be considering the conditions, as to whether or not the cholera bacilli of hogs might be transmitted through the canal and the waterways connecting the Mississippi River below the mouth of the Illinois?

A. There is no question in my mind but that they might be and very probably would be so transmitted.

Q. Have you any knowledge as to the longevity of the hog cholera bacilli?

A. That has not been accurately determined, so far as I know, but there is every evidence that it may exist for considerable periods, for several weeks.

Q. Mr. Williams, considering your knowledge of the Illinois river, the drainage canal and the Desplaines river and the Mississippi river below the mouth of the Illinois at Grafton, the conditions of said rivers; the beds of the streams, the flow of the streams, and the velocities, the volume of water, and all other existing conditions so far as you know the same, as an expert

on the flow of streams, and the action of waters in scour-
4056 ing the beds of streams, and the depositing of material in the beds of streams, as a result of the action of the waters and the flow thereof in the streams, I will get you to state whether or not in your judgment, mud, silt and sewage matter under existing conditions may or may not be removed from the bed of the Illinois river, the drainage canal and the Desplaines river and deposited in and upon the bed of the Mississippi river?

A. From my knowledge of the points raised in the question and my general familiarity with the flow of water in streams, and the accompanying phenomena, I would say that there is no doubt that such deposits as are mentioned in the question may be, have been and will be carried from the drainage canal or Desplaines River and the Illinois river, into the Mississippi River and there deposited to remain for a greater or less time upon the bed and sides of such river.

Q. Mr. Williams, will you please state whether or not in your opinion the volume of water added to the Desplaines and the Illinois Rivers by the opening of the drainage canal in January, 1900, would increase the amount of mud and sewage and silt that might be removed from the canal, the Desplaines and the Illinois rivers and deposited in and upon the bed of the Mississippi River?

A. It would unquestionably increase the quantity of such
4057 material so delivered.

Q. Why?

A. Because it has very greatly increased the velocity of flow at low stages of the river, and has therefore prevented to a considerable extent the deposit of the material which otherwise would have found its place upon the bottom of the stream, and has caused it to continue in suspension for a longer time and therefore to have reached the Mississippi river more promptly and more surely than it would otherwise have done.

Q. Mr. Williams, have you been to the chain of rocks water station of the St. Louis waterworks?

A. I have.

Q. Have you examined the location there with reference to the river and the intake tower and the general condition of the flow of the stream and direction?

A. I have.

Q. Did you or did you not examine the Missouri bank of the Mississippi river some distance above the pumping station and above the intake tower?

A. To some extent I did.

Q. Do you know whether or not there is any of what is commonly called riprapping on the Missouri shore above the intake tower of the St. Louis waterworks?

A. I observed that for a considerable distance above the
4058 intake tower of the St. Louis waterworks the bank of the
river has been riprapped, evidently to prevent the cutting
of that bank by the current which was impinging upon it from
the bend in the river above, and had undoubtedly scoured away
considerable portions in times previous to the construction of the
said riprap.

Q. Mr. Williams, assuming that an epidemic of Asiatic cholera should occur in the city of Chicago under existing conditions of sewerage in said city and existing conditions in and upon the drainage canal, the Desplaines and the Illinois and the Mississippi river, and the existing conditions with reference to the intake tower of the St. Louis waterworks, and the storage and distribution of the water from the chain of rocks to the consumers in the city of St. Louis; I will ask you as an expert on water supplies for cities and towns, is it possible or probable that the germs of that disease might find their way into the intake tower of the St. Louis waterworks at the chain of rocks and thence to the consumer?

A. In the event of an epidemic of Asiatic cholera in Chicago
under the conditions now existing in the waters between Chicago
and the chain of rocks, through which the sewage of Chicago
now flows, there is not only a possibiliy but probability and
almost a certainty that the germs of the disease would be com-
municated or transmitted to the water supply of the city
4059 of St. Louis and the consumers thereof.

Q. Now Mr. Williams, what effect, if any, would the conveyance of Asiatic cholera germs have under those circumstances upon the people of the city of St. Louis?

A. It would undoubtedly lead to an outbreak of Asiatic cholera in the city of St. Louis.

Q. Now Mr. Williams, I will get you to state whether or not in your opinion as an expert on water supplies for cities and towns, if it is within the bounds of human possibility for any competent expert upon the subject of water supplies for cities and towns to say that in a period of low water in the Missouri river, such as is likely at times to occur, and a thaw occurring at such times, on the Illinois watershed, that the lives of the people of Missouri below Grafton, Illinois, using the waters of the Mississippi river for drinking purposes and the lives of the people of the city of St. Louis using said water for said purposes, might not be endangered by having carried to them through the drainage canal from the outfalls of the sewers of the sanitary district of Chicago down the Desplaines, the Illinois and the Mississippi rivers, the infected sewage of the sanitary district of Chicago?

MR. TODD: I object to the question on the ground that this witness has not qualified as an expert on experts, as the field of expert testimony is unlimited. 4060

A. If, with the knowledge of the existence of the conditions at Chicago and along the drainage canal, the Desplaines river and the Mississippi river, that are now known to me to exist,—

Q. You had better state the proposition in a different way. People might interpret that question differently.

JUDGE JOHNS: I suggest that the witness has a right to answer it as he sees fit.

A. (Continued) an expert should state that it is impossible for infectious matter discharged by the sewers of Chicago to reach the Missouri shore of the Mississippi river, and the intake of the St. Louis waterworks at the chain of rocks and to be a source of danger to the citizens of Missouri, residing on the Missouri shore of the Mississippi river and using the water therefrom for drinking purposes below the mouth of the Illinois river, and the citizens of St. Louis using the water supply drawn through the intake at the chain of rocks, I should say that he had thereby shown such lack of knowledge of the history of water-borne diseases, and the life and phenomena connected with their transmission and infection, as well as of the laws of flow of water in open channels, as to totally disqualify him as an expert upon the sanitary value or quality of a public water supply.

MR. TODD: I move to strike out the answer as it is not the 4061 prerogative of this witness to pass judgment upon the evidence of experts if any may be called upon to give testimony upon such hyphothetical question as is included in the question, but it is the prerogative of the Supreme Court of the United States; and for the further reason that the witness has shown a lack of knowledge in regard to experts.

GENERAL CROW: Mr. Williams, as an expert on water supplies for cities and towns considering your personal knowledge of the typhoid fever conditions in the Sanitary District of Chicago, and the existing conditions in said district as to sewers, and the out-falls thereof, and the amount of sewage, and all the existing conditions of the drainage canal, the Desplaines, and the Illinois, and the Mississippi, and Missouri rivers, and the water-sheds of said streams, and all the conditions existing in said water-sheds, and the existing conditions as to the water supply of the city of St. Louis and the location of the intake tower of the St. Louis waterworks in the channel of the Mississippi river 1500 feet from the Missouri shore, and the general sanitary conditions existing now in the city of St. Louis, would you or would you not from all the knowledge that you possess, as an expert on water supplies, beyond reasonable doubt, attribute the principal portion of the increase of typhoid fever in St. Louis, Missouri since January 17th, 1900, the date of the opening of the drainage canal, to the infected sewage of 4062 the Sanitary District of Chicago?

A. I would.

Q. Now Mr. Williams, what is the most common method of sewage becoming infected with typhoid bacilli from cities and towns that have sewers, if you know?

A. By the discharge into those sewers of the dejecta of typhoid fever patients, or of those into whose intestinal tracts the typhoid fever germ has entered.

Q. Now, Mr. Williams, as an expert on water supplies, I will get you to state what in your opinion is the most dangerous source of disease producing infection in public water supplies of towns and cities in this country?

A. The sewage of large communities.

Q. Now Mr. Williams, as an expert on water supplies, I will ask you if you have ever had any experience in investigating typhoid epidemics caused by seriously infected water in running streams or lakes, that would cause you to believe any stream can be absolutely relied upon at all times to remove disease bearing germs such as typhoid bacilli, which may have been placed therein?

A. I have not.

Q. Now Mr. Williams, looking forward into the future and considering not this generation alone, but those that are to follow, and considering the relation of the filth and infection 4063 of the Chicago sewage to the water of the Mississippi river as it flows along the Missouri shore, I will ask you to state your views as an expert on public health matters, regarding the above mentioned conditions, considered as a broad, practical proposition?

A. With regard to the effect on future generations of the discharge of Chicago sewage into the Illinois river and thence into the Mississippi river, and its effect upon the water of the Mississippi river, I would say that there is no question in my mind, but that the problem before future generations is one of far more difficult solution than that which we face in the present. A careful study of the relations existing between the flow of the rivers which contribute to the water flowing past the chain of rocks, and the prevalence of water-borne diseases in the city of St. Louis among those of her citizens who are users of the public water supply, has led me to the conclusion that at the present time the remarkable immunity from serious typhoid infection which the citizens of St. Louis have thus far experienced, although they have been using water which is unquestionably at the time of its entering the intake considerably polluted, is due very largely to the character and amount of water contributed by the Missouri river. I long ago learned to appreciate 4064 the importance, from a sanitary standpoint, of Missouri river mud. As the Missouri river enters the Mississippi river, the amount of silt in suspension in its water amounts often times to over 1200 parts in a million. A large portion of this

silt is of such a nature as to be quite readily deposited as the water approaches a state of approximate quiescence, and such a vast quantity of depositing mineral matter mixed thoroughly throughout the water of the settling basins of the St. Louis waterworks cannot fail, and analyses show that it has not failed, to remove a very considerable percentage of the bacteria which are daily brought into those settling basins in the water as it comes from the Mississippi river. Laying aside the question for the moment, of the possible increase of infectious matter in the water supply through the intake at the chain of rocks, due to the increased growth of the city of Chicago and the other populations upon the drainage area of the rivers which contribute to the St. Louis water supply, it is to be borne in mind that as time goes on, the history of the Missouri river will become the history of every other stream upon whose borders the hand of man has rested, and that while the total quantity of water which that stream will deliver from year to year, will remain about the same as now, the quantity of water which will be delivered in times of drouth will be decidedly less than heretofore, and that larger and larger portions of the discharge will be concen-
4065 trated in a few floods. The result of this upon the waters
mingling to form the supply of St. Louis, will be that in the future the Missouri river will show a greater diminution in the percentage which it represents of the flow past the city, than will the waters derived from those other two streams upon which the hand of man has already rested for so long a time, that comparatively small changes are to be anticipated in the future in the quantities of their low water run-offs. It will therefore follow that the amount of silt that will be furnished by the Missouri river will be less and less sufficient to remove from the mixed water the numbers of disease germs which even now exist there, leaving alone the possibility, the probability and the certainty that the numbers of those germs will vastly increase as time goes on. It therefore seems quite clear to me that any added pollution to the waters of the Illinois or the Mississippi river will have from year to year a greater and greater effect upon the healthfulness and quality of the water which will be delivered, under circumstances similar to those now existing in the treat-

ment of the water delivered to the citizens of St. Louis by their waterworks system, and when we consider that in the city of Chicago there is now a population representing above one-third of the total urban population upon the watersheds tributary to the Mississippi river at St. Louis, and probably repre-
4066 senting more than one-sixth of all the population resident upon those watersheds, and that now no city in this portion of the United States, if indeed in any portion of it, has shown such remarkable and rapid growth both in population and in industries as Chicago, there can be no question that in the future the menace to the health of St. Louis arising from the discharge into the Illinois river of the sewage of the Chicago Sanitary District, will be a much more tremendous and impending danger to the citizens of Missouri living along the Mississippi river below the mouth of the Illinois than exists at the present time, grave though the present condition be.

Q. Mr. Williams, I will get you to state whether or not you have considered the question of the relative amount of the sewage producing population in the water-shed tributary to the intake tower of the St. Louis waterworks, as compared with the sewage producing population of the Sanitary District of Chicago?

4067 A. Understanding you to mean by sewage producing population that population which contributes its dejecta through established sewer systems, or discharges it in such a way that it may rapidly find access to the streams tributary to the Illinois, Mississippi and Missouri rivers, above the chain of rocks; I would say that I have considered the subject and from a long personal observation of the extent to which sewerage systems are ordinarily utilized in communities of various sizes, and the extent to which liability exists of infectious matter from rural communities finding its way into the streams of running water, and considering the fact which has already been established by testimony presented in this case, that in the Sanitary District of Chicago a very large portion of those resident therein, are connected to and use the sewers which are discharging into the Chicago river, and thence into the Chicago Drainage Canal,—I would say that there is no doubt in my mind that the population of the City of Chicago is today contributing considerably more than half of the entire sewage pollution which reaches the streams upon the water-sheds tributary to the Mississippi river above the chain of rocks.

Q. Mr. Williams, considering all the towns and cities on the watersheds tributary to the waters of the Mississippi, below the mouth of the Illinois, and above the intake of the St. Louis waterworks, which said towns may have 4,000 population
4068 or over, as urban population, I will get you to state
whether or not you know what percent of urban sewage producing population has been added to the water-shed tributary to the intake of the St. Louis Waterworks by the opening of the drainage canal on the 17th of January, 1900, and the deposition into said canal of the sewage of the Sanitary District of Chicago?

A. I find upon examination of the populations in cities of 4,000 inhabitants or more, resident upon the water-shed of the Mississippi river and its tributaries above the chain of rocks, exclusive of those residing in the Sanitary District of Chicago, and a comparison with the population of the said Sanitary District, contributing its sewage to the Chicago Drainage Canal, that when the said Chicago drainage canal was opened in January, 1900, there was added to the population previously existing in cities of 4,000 inhabitants or more, upon the water-shed of the Mississippi River above the chain of rocks, a number of urban inhabitants amounting to over sixty per cent of those already there, and a number of sewage contributing inhabitants sufficient to more than double the number previously existing.

GARDNER S. WILLIAMS.

ADJOURNED until 10:00 A. M. Wednesday, May 27, 1903.

4069 Southern Hotel, St. Louis, Missouri. 10:00 A. M., Wednesday, May 27th, 1903. Parties met pursuant to adjournment. Present the Commissioner and same counsel representing the respective parties.

GARDNER STEWART WILLIAMS

resumed the stand for further direct-examination by Attorney-General Crow, and testified as follows:

Q. Mr. Williams, you stated in your testimony yesterday that it was your opinion that the flow of water in low water stages in the Missouri River would lessen as the years increased; what reason have you for making that statement?

A. The history of practically all the streams in the country upon which the population has increased, and where the forests have been cut off in the progress of development, has shown that such denudation of the forest areas has the effect of increasing the flood flows and decreasing the low flows for the reason that the forests naturally act somewhat in the nature of reservoirs and store up at times of freshet or heavy rainfall, or times of melting snow, a considerable portion of water, which when the forests are removed, is immediately contributed to the streams, and therefore increases the floods. This water when stored up by the forests is gradually leeched out of them during the dryer periods, thereby continuing to maintain, 4070 or tending to maintain the stage of the river more constant than would exist if such forest tracts were not there; and as there is no question that along the head waters of the Missouri river there will be a considerable increase in population; that there will be a considerable removal of timber from the forested lands in that region, and that furthermore there is likely to be a considerable diversion of the waters of the Missouri River, particularly in time of drouth, for irrigation purposes, it is quite certain that the flow of that stream at low water periods will decrease to a considerable extent in the future. On the other hand, with the other tributaries, particularly the Illinois, it does not appear that the increase of population will make very much difference in the temporary retention of water upon that watershed, especially as the flow contributed by the sanitary district is a very large percent, in fact, three or four times, even five times as much as the natural low water flow of the stream, and the upper Mississippi has been so generally populated that it is not to be anticipated that any very great further change in the low water flow will be brought about there, as the cutting off of timber along its head waters has already reached an extent which is so great that the future is not likely to change the conditions very much, whence in view of all this, I conclude, as stated 4071 yesterday, that the proportion of water to the entire water which flows past the city of St. Louis, that will be contributed by the Missouri River in times of drouth, will be relatively less than it has been in the past, and furthermore, the amount of sedimentary matter carried by the Missouri river itself will be reduced by reason of the reduction of flow in its upper tributaries, and consequently its effect in producing precipitation of the bacteria in the mixed water will be decreased in even greater proportion than the decrease of percentage of Missouri River water at the St. Louis intake.

Q. Mr. Williams, are you acquainted with the appearance of the surface of the waters of the St. Clair river, as to whether or not they flow smoothly or roughly in their course?

A. I am, having traveled over the river on numerous occasions in boats,—I have observed the flow of the stream, and it may be described as being a swift but placid flow, there being very little evidence of eddies or disturbances in the regimen apparent on its surface.

Q. Mr. Williams, you live now at Ithaca, New York?

A. Yes sir.

Q. I will get you to state whether or not there has been any typhoid fever epidemic at Ithaca recently?

4072 JUDGE JOHNS: The defendant, State of Illinois, objects to all statements as to the supposed epidemic at Ithaca, New York, as irrelevant and incompetent.

A. There has been a very remarkable and interesting epidemic of typhoid at Ithaca during the past four or five months—four months.

Q. When did that typhoid epidemic begin, and what was the extent of it?

A. The epidemic condition apparently made its first appearance about the 16th of January—

Q. Of what year?

A. Of 1903; when half a dozen or more cases of typhoid put in their appearance, without there having been any previous indication of an excess of typhoid in the community. It has been estimated that between 1,000 and 1,200 cases of typhoid have occurred in Ithaca as a result of this outbreak, and there have been in the neighborhood of sixty or seventy deaths from that cause since the middle of January.

Q. What is the population of Ithaca?

A. The population of Ithaca is about between eleven and twelve thousand, with probably 3,000 students and those who are brought there with them, temporarily, added.

Q. Students of what?

A. Students in Cornell University, which is one of the
4073 principal colleges in the State of New York.

Q. Was this disease spread among the university students?

A. It was to a very considerable extent; in fact about half the deaths having occurred among students.

Q. Does the whole town of Ithaca and the Cornell University use the water from the same supply?

A. The water supply of Ithaca is derived from you might say, four sources. Cornell University has a water supply of its own taken from Fall Creek, a stream having a drainage area of about 115 square miles. This water is used upon the university campus and is delivered to those students resident upon the campus, which composes the majority of women students of the university who are quartered in the dormitories on the campus, and probably 150 to 200 of the male students who live in fraternity houses located upon the campus, and therefore receive the water supply of the university. This supply is not delivered to any localities off from the university campus itself, and the large majority of students, something in the neighborhood of 75 per cent, reside in the town itself. The town outside of the University, has as I have already stated, practically three water supplies; the oldest being that from ordinary wells, deep or shallow, which are still used to a considerable extent in many por-
4074 tions of the city, and exclusively in some portions. The
public supply, so-called, which is furnished by a corporation known as the Ithaca Water Works Company, is obtained from two streams, one of them known as Buttermilk Creek, which has a small drainage area of somewhere near 15 square miles, perhaps, and a part from a stream known as Six Mile Creek, which has a drainage area of about 50 square miles. The water obtained from Buttermilk Creek is mixed with that of Six Mile Creek, and delivered to certain portions of the city. The mix-

ture so delivered being varied in proportion to ingredients, in certain localities.

Another locality of the city, which is especially occupied by student boarding houses, and where perhaps nearly half of the students who reside outside of the limits of the campus are domiciled, is supplied with the Six Mile Creek water alone.

The epidemic broke out practically all over town, excepting upon the campus, and in those portions where well water was used exclusively, and the distribution of the cases, the ages of the persons having the disease, and all other phenomena connected with the epidemic indicated to anyone familiar with such conditions, that it was an outbreak due to water-borne infection.

In addition to that, examinations of the milk supply and
4075 other possible sources of original infection were made by
the local Board of Health, which established the fact to the satisfaction, I think of all concerned,—certainly to my own,—that the epidemic was beyond question primarily due to an infection of the water supply of either Buttermilk Creek or Six Mile Creek, or both.

A further examination of the conditions proved what had been well known to many of us, that there was no reason to suppose that the water supplies of any of the streams, either Fall Creek, Six Mile Creek or Buttermilk Creek, might not at any time become seriously infected with the typhoid germs, or with any other of the ordinary water-borne diseases, and I may incidentally state, that as Consulting Engineer of the Ithaca Waterworks Company, I had informed them that they would in the nature of things, be compelled probably within five years, to install a filter plant for the purification of the water, which they were supplying to the city, and plans had already been begun and pretty thoroughly arranged for the construction of a filtration plant, as soon as the financial resources of the Company would permit of the expenditure.

An examination as to the specific cause of the outbreak showed that it was possible that it might have come from several sources, and that quite probably part of the typhoid existing in
the city did come from various sources upon the water-
4076 shed, but the most probable source of the bulk of the in-
fection lay in the fecal discharges of a gang of workmen

who were employed by one of the railroads in the construction of some culverts across one of the tributaries of Six Mile Creek, some five or six miles above the intake of the waterworks, which discharges were delivered upon the ground or in a shallow trench, near the bank of the stream, and which discharges, it has been ascertained were infected by those of typhoid-fever patients, that disease having appeared among the workmen there employed, and which discharges by reason of a considerable thaw occurring about the first of January, were washed into the stream, a portion of the bank slumping away, or caving into the water, and the infection thereby being carried down the stream to the intakes of the waterworks and thence distributed to the consumers. It is quite interesting also, in connection with this epidemic to see that there were probably continued re-infections of the water supply following successive freshets, showing apparently that this material originally washed in, in the early January freshet, was in part deposited along the sides and bottom of the stream, and then picked up by a succeeding freshet, to be washed on down and re-infect the supply at a later date.

I may also say that the infectious matter which caused this outbreak was delivered upon the banks of the stream 4077 during the summer and autumn months, and had undoubtedly lain in the fecal deposits for a number of weeks before finding its entrance into the stream.

In giving this explanation, as I have already said, I do not wish to be understood as eliminating the possibility or probability of other infections having reached the waters of the stream in a moderate degree, but this seems to be the most probable, and in fact the only source of infection sufficient to explain the remarkably severe and sudden character of the outbreak.

Q. Are you acquainted with the appearance of the water supply from the portions of the town of Ithaca served with water from the drainage area of the two creeks, Six Mile and Buttermilk, as to whether or not it was turbid or clear at the time the outbreak occurred?

A. At the time of the outbreak, or at the time when the infection must have first been received, the water was quite

parently that the infection was mild, and it was traced
4081 immediately to the water, and the water authorities
therefore decided that a scarcity of water was preferable to an impure supply, and refused to permit the intake into the lake to be opened any further, except in case of a fire, and the fever died out in the course of a comparatively short time The disease was prevalent perhaps for two months and then disappeared, and since that time there has been no recurrence, the supply having been restricted to the wells until the additional supply was put in, in 1898, when it was drawn from the sands along the shores of Lake Michigan and a most excellent water has been since obtained.

JUDGE JOHNS: I move to exclude the answers of the witness as to the disease in Ithaca, New York, and in Charlevoix, Michigan, as incompetent and irrelevant testimony.

CROSS-EXAMINATION BY JUDGE JOHNS.

Q. What degree did you receive from the University of Michigan in 1889?

A. Bachelor of Science in Civil Engineering.

Q. After how many years of study in Michigan University?

A. I had been there about four years and a half.

Q. Did you commence the practice of civil engineering immediately after your graduation?

A. I had been engaged upon civil engineering for two years before I graduated, during portions of my time.

4082 Q. The question is, did you commence to practice immediately after your graduation?

A. I continued to practice immediately after my graduation.

Q. Where did you first practice civil engineering after your graduation?

A. At Detroit.

Q. How long did you continue there?

A. About a month.

Q. Where did you then go?

A. To Owasso.

Q. How long were you there?

A. About five or six months.

Q. When did you commence your experience as a water supply engineer at Bismarck, North Dakota?

A. In July, 1887.

Q. When at Greenville, Michigan?

A. June, 1888.

Q. When did you become Civil Engineer to the Board of Water Commissioners of Detroit?

A. February, 1893.

Q. Were you in Detroit in 1891?

A. I was.

Q. What were you doing then?

A. I was superintendent of erection for the Russel 4083 Wheel and Foundry Company, a manufacturing concern doing a general structural iron business in the city of Detroit.

Q. When did you cease that employment?

A. In February, 1893.

Q. You continued with this company from 1891 to 1893?

A. From 1890 to 1893.

Q. You weren't in the employ of the city of Detroit in 1891 or 1892?

A. No sir, not directly.

Q. Has the business of civil engineer departments or branches?

A. It has, certainly.

Q. What department or branch of civil engineering did you follow and practice from 1889 to 1893?

A. What you might call structural engineering.

Q. The drawing of plans and specifications, and having charge of the erection of structures?

A. Yes sir.

Q. When did you investigate the epidemic of typhoid fever which appeared in Detroit in 1892?

A. From 1895 to the present time.

Q. At the time of this epidemic you made no kind of investigation of it?

A. No sir.

4084 Q. And were not then practicing that branch of civil engineering which pertains to the erection of water supply system?

A. I was not.

Q. Can you remember when you commenced to investigate the epidemic at Detroit in 1895, what time?

A. Some time in the fall.

Q. At whose request or by what authority did you make that investigation?

A. By the authority vested in myself as Civil Engineer to the Board of Water Commissioners who was, by the act of the Board creating the office, especially at all times, to make it his study and care that the water supply furnished to the citizens of Detroit and the methods of furnishing it, should be the best that was possible under the circumstances.

Q. What did you do in investigating the epidemic at Detroit in 1895?

A. I first personally searched through the records of the local Board of Health, to ascertain whether there had been an epidemic and if so, what its proportions were and what its peculiarities. I examined all the typhoid records of the city of Detroit from the date of the establishment of the local Board of Health and made transcripts therefrom, of the history as recorded in the mortuary records of all the cases of typhoid which
had occurred in the city, or that had been buried from the
4085 city, within the time preceding the beginning of my in-
vestigations, and such investigations I was able to continue until about the close of 1899.

Q. What else did you do?

A. I also examined into the prevalence of typhoid fever throughout the cities and towns upon the watershed tributary to the city of Detroit; examined into the prevalence of typhoid fever throughout the State of Michigan and throughout the country in general and set forth in the reports of the Boards of Health concerned, as I was able to obtain information, and from special inquiry in special localities. I proceeded to examine personally as far as possible for sources of possible pollution from the city of Detroit and inaugurated a system of survey of the Detroit river to ascertain whether it would be possible that the infection might have come from the tributaries adjacent to the city of Detroit, and in fact proceeded to go through all the ordinary processes that any epidemiologist has to go through in making an investigation in regard to an epidemic of any sort.

Q. You were not at that time an epidemiologist, were you?

A. I had made at that time a very careful study of the literature of typhoid fever epidemics that was ordinarily accessible, or that I could make specially accessible to myself, and I considered myself abundantly competent to examine into
4086 and pass judgment upon the probable causes of an epidemic of typhoid fever if such causes should become apparent to me.

Q. What do you call the watershed of the waters tributary to and furnishing water to Detroit?

A. I limited that watershed to those portions of the entire watershed of the upper Great Lakes which drained naturally into the Detroit River above the intakes of the Detroit Waterworks, into Lake St. Clair, into St. Clair River, and into portions of Lake Huron immediately adjacent to the head of St. Clair River. I did not of course attempt to include the cities of Chicago or Milwaukee, or the upper shores of Lake Huron or Lake Superior, but I embraced all that territory which I had then reason to believe could possibly have contributed to the infection, and I am still of the opinion that I covered sufficient ground to exclude the probability of any great degree of infection coming from beyond those limits.

Q. How many miles from the intake of the Detroit Waterworks did your investigation cover?

A. In certain directions, a matter of two or three hundred miles.

Q. In the direction of the Detroit River, Lake St. Clair, St. Clair river and Lake Huron?

A. Upwards of a hundred miles.

Q. Along both shores or banks of Lake Huron?

4087 A. Yes sir.

Q. Why did you not go further?

A. Because I regarded it as quite improbable that typhoid fever infection contributed by any of the communities tributary to the shores of Lake Huron above the mouth of the St. Clair

River, those communities being in general small and very few, and they not discharging sewage into the lake anyway, could possibly contribute a sufficient amount of contamination to mix itself with the water of such a body as Lake Huron and thereby produce any such serious infection as evidently had existed in the Detroit water supply at the time I had under consideration.

Q. When you commenced this investigation in 1895, had you discovered from the literature in reference to typhoid fever, that no case of typhoid fever had in that literature been attributed to infection at a greater distance than thirty miles?

A. So far as I recall I had no knowledge of a case where the infection was attributed to a travel of more than thirty miles in a water supply.

Q. Had you any personal knowledge of any distance to which might be attributed typhoid infection traveling by water, in 1895?

A. Well, if you mean by personal knowledge an actual pursuance of the infection, I certainly had not. If you mean by
4088 personal knowledge such knowledge as a person obtains by
a study of treatises on typhoid fever, and the reports of published and well substantiated epidemics, I had knowledge.

Q. Independent of what you learned with reference to typhoid fever in publications in 1895, you had no knowledge of the transmission of typhoid germs in running water, had you?

A. I had knowledge of the transmission of typhoid infection through water at that time.

Q. The question is confined as to your knowledge as to the transmission of typhoid germs in running water.

A. I cannot recall whether the water in question was running water or not. My impression would be that there very likely was a current in it.

Q. Where was this?

A. It was in Kentucky.

Q. That you had personally investigated?

A. The case was that of my brother who got typhoid fever from drinking out of a marshy body of water which was infected by the discharges of his fellow workmen, and he was brought home and I helped to nurse him through the attack.

Q. You made no personal investigation of the locality?

A. I did not.

Q. Then you had in 1895, no knowledge derived from your personal investigation as to the transmission of typhoid 4089 germs in running water?

A. I think I had as much personal knowledge of the transmission of germs of typhoid in running water as anybody else could possibly be said to have, if you restrict the personal knowledge to the actual observation of the transmission of the specific germs.

Q. You had in 1895, derived from your own personal investigation of the conditions and circumstances any personal knowledge as to the transmission of typhoid fever germs in running water?

A. Understanding you to mean by personal knowledge actual observation of the transmission of the specific infection through running water, I have not, nor has anybody else at the present time.

Q. Understanding my question to mean precisely what it says, I will ask the reporter to read it to you and ask you for an answer.

GENERAL CROW: I would suggest that the witness has answered the question and has a right to answer it in his own way, and interpret the question in his own manner, unless counsel explains the question to him and shows he doesn't understand the question.

(Question repeated.)

A. I think my answer covers the question as I understand it.

Q. JUDGE JOHNS: Had you up to 1895, personally in-4090 vestigated any of the facts and conditions by which you afterwards arrived at the conclusion that the disease of typhoid fever was caused by the transmission of typhoid germs in running water?

A. Up to the middle of 1895, I had not.

Q. Then when you commenced the investigation in 1895, as to the cause of typhoid fever in Detroit, in 1892, it was a new branch of civil engineering to you, or water engineering and supplies?

A. I think it may be so considered.

Q. Where did you learn that the harbor of Port Huron had been dredged?

A. Where?

Q. Yes?

A. At a meeting of the Detroit Engineering Society, held at the Hotel St. Claire in Detroit, was the first I knew.

Q. At what time?

A. I think it was some time in 1896, or possibly 1897.

Q. The first that you learned or knew of the fact that the Harbor of Port Huron and the mouth of the Black River had been dredged by the government was in 1896 or 1897?

A. I will correct my former answer; it occurs to me that information did come to me in a letter from the City Engineer of Port Huron previous to the information which I received at the meeting of the Detroit Engineering Society.

4091 Q. How long before?

A. A matter of two weeks, or probably not more than three or four.

Q. So that the first you knew that the harbor of Port Huron had been dredged was in 1896 or 1897?

A. Yes sir.

Q. Which year was it to the best of your recollection, 1896, or 1897?

A. I am unable to state positively, but I think it was late in the fall, possibly in December, 1896.

Q. You ascertained the number of cases of typhoid fever, and the deaths consequent in 1892, in Detroit from the mortuary records, did you, of Detroit?

A. I had no means of ascertaining the number of cases, because there was no record thereof kept. I did ascertain however the number of deaths from the mortuary records of the Board of Health of the City of Detroit.

Q. Were they recorded by days or months?

A. They were recorded consecutively as the certificates were issued. The record gave the date of the issuance of the certificate and the date of the death.

Q. Were those records in tabulated form?

A. They were in the ordinary mortuary record book, in which the deaths from all diseases and from all causes appeared, as I said, in the regular sequence of the issuance of the death certificates. 4092

Q. Then the mortuary records of Detroit are made up not from the deaths reported, but from the death certificates issued?

A. They are either posted from the death certificates or the entry in the mortuary record is made at the same time that the certificate is issued. I think that both methods of procedure have been followed at different times during the keeping of the records.

Q. Then all that you know positively as to the number of deaths in Detroit is derived from an inspection of the records?

A. And also from the published reports of the Local Board of Health and from the published reports of the Michigan State Board of Health and from occasional personal knowledge of deaths from typhoid in Detroit which came under my observation while a resident there.

Q. Those cases which came under your personal observation were reported were they not, and became a part of some of these reports?

A. They were reported, certainly.

Q. Did you go to Port Huron in 1896, to investigate the dredging done there in 1892 and 1891?

A. No sir.

4093 Q. Did you ascertain in Port Huron the number of cases of typhoid fever or deaths from typhoid fever in 1890, or in the preceding year?

A. As I remember the matter now, there were no records available in 1890, or during the preceding years.

Q. Were there any records available in 1891 at Port Huron as to the deaths from typhoid fever?

A. The records in 1891 I believe, were obtained from the Michigan State Board of Health.

Q. How the Michigan State Board of Health obtained it, you do not know?

A. They obtained it from the report of the Health Officer or person in Port Huron reporting the appearance of typhoid to them.

Q. Whether that report was correct or not you do not know?

A. I certainly do not.

Q. Do you know how many cases of typhoid fever there had been in Port Huron in 1891, prior to November?

A. My recollection is there had been two cases reported.

Q. Do you know how many cases had been reported in 1890, during the entire year?

A. I do not. My impression is, there had been none reported.

Q. Do you know as to 1889 or any preceding year?

A. I do not.

4094 Q. So that when you commenced these investigations you didn't know even by the records, of a greater number than two deaths from typhoid fever in Port Huron for any time preceding 1891?

A. When I began this investigation I didn't know of any deaths in Port Huron from typhoid fever.

Q. And you do not know of any now, do you?

A. I was not personally acquainted with any persons who died from typhoid fever in Port Huron.

Q. Do you know from the records, and if so, from what records, of the existence of typhoid fever in Port Huron prior to November, 1891, with the exception of the two cases which you recollect?

A. I do not.

Q. So that absolutely, you never did know and do not now know whether there were more than two cases of typhoid fever in Port Huron.

GENERAL CROW: Two deaths.

JUDGE JOHNS: Two deaths from typhoid fever in Port Huron prior to November, 1891?

A. I do not.

Q. Do you know from the records or in any other way of a case of typhoid fever in Port Huron prior to November, 1891, and if so, how many do you know of, irrespective of deaths?

A. My recollection is that I know of two.

4095 Q. These are the same two you have mentioned.

A. They are.

Q. Were those cases of deaths or merely sickness?

A. I cannot positively recollect, but my impression is they were cases, not deaths.

Q. How large a town was Port Huron in 1891?

A. I haven't the exact figures. I should say it was somewhere in the neighborhood of nine or ten thousand.

Q. You have no statement from the census of 1890?

A. I have a statement from the census of 1890, for the entire county, but I haven't for Port Huron separately, here.

Q. What was the population of the county of Port Huron in 1890?

A. The population of St. Clair county in which Port Huron is situated, was about 51,000 in 1890.

Q. How large a territory did the county of St. Clair embrace?

A. Oh, pretty nearly 700 square miles.

Q. How many other villages and towns are there in the county?

A. There are several others. I am not prepared to say at this moment just how many. Possibly I have sufficient information here so that I can give you an idea, but I haven't it in mind. No I am not able to state at the present moment.

4096 Q. Do you know of any other town in St. Clair county having a population of 4,000 or over?

A. My impression is there was not at that time.

Q. Are there any cities or towns of a population of over 4,000 above Port Huron, on the eastern side of the southern peninsula of Michigan?

A. Several.

Q. What are they?

A. Do you mean upon the borders of the lake, or do you mean to take the eastern half of the State of Michigan?

Q. Upon the borders of lake.

A. Bay City and West Bay City would be, I think, the next ones, and I guess the next one you would come to would be Alpena.

Q. Alpena is quite up at the northern end of the peninsula?

A. Well, it is pretty well up. I would say it is four-fifths of the way.

Q. What are the populations of those various towns?

A. Bay City and West Bay City together—

GENERAL CROW: At that time, Judge?

JUDGE JOHNS: Yes, what were the populations in 1890?

A. A population of somewhere around 40,000.

Q. That is, Bay City and West Bay City?

A. Yes, sir; the towns are there together.

Q. Are those two towns situated upon a river?

4097 A. Situated about three miles above the mouth of the Saginaw river; yes, sir.

Q. The Saginaw drains into Lake Huron or the St. Clair river?

A. Saginaw river drains into Saginaw Bay, which is an arm of Lake Huron.

Q. Are there any villages or towns below Port Huron and between that and Detroit, on the shores of Lake St. Clair or the banks of the Detroit or St. Clair rivers?

A. There are.

Q. What are they?

A. St. Clair.

Q. Having a population of how much in 1890?

A. I do not remember exactely, but I should say 2500 or 2800, somewhere along there.

Q. Any other?

A. Marine City, which I think is not quite so large, and Algonac, which is nothing more than a village.

Q. Are there any cities on the Canadian side of the Detroit river?

A. Above the Detroit intake?

Q. Yes?

A. No, sir.

Q. On Lake St. Clair?

4098 A. No, sir.

Q. On the St. Clair river?

A. I think there are no cities; there are a few villages.

Q. Having a population of over 4,000 any of them?

A. I think not.

Q. Now, Lake St. Clair is about 24 miles in width and length?

A. Yes, including in the length the length of the delta, which is properly a part of the lake.

Q. And that delta is the delta of the St. Clair river?

A. Yes, sir.

Q. A very large part of Lake St. Clair is very shallow, isn't it?

A. Why, the delta portion which perhaps amounts to one-fourth of its area is quite shallow, but the bulk of the lake is of fairly good depth. The depth runs as high as 20 feet in some places, and for a stretch of ten or twelve miles there is a depth of over 16 feet, continuously, I think, in both directions.

Q. For what distance in width is there a depth of from ten to twenty-five feet?

A. If I said twenty-five feet, it was a mistake.

Q. I am assuming 25 feet.

A. I cannot give a specific answer without measuring a chart of the lake, but in general it represents probably
4099 half of its area.

Q. Now, through Lake St. Clair there is a well defined channel in which boats travel?

A. There is at the present time.

Q. Was there in 1890?

A. No, sir.

Q. Was there no channel marked by buoys in Lake St. Clair in 1890?

A. Not through the entire lake. There were channels marked by buoys across certain bars occurring in the lake, those bars being at the outlet of the lake.

Q. Do you know whether in 1890, boats traveled up and down Lake St. Clair in their passage from one river to the other, and followed a well defined course?

A. They did.

Q. And always practically the same course?

A. No.

Q. If a boat were passing from Lake Huron into Lake Erie, it would pass through St. Clair river?

A. Yes, sir.

Q. Lake St. Clair?

A. Yes, sir.

Q. And the Detroit river?

A. Yes, sir.

4100 Q. If it were a large boat, carrying a large amont of freight, wouldn't it travel in a certain well known and ascertained course through Lake St. Clair?

A. It would at the present time.

Q. Would it in 1890?

A. It would not necessarily have done so.

Q. How much of the space in width east and west was there in Lake St. Clair from the delta of the St. Clair river to the mouth of the Detroit river in which a boat of large carrying capacity could safely travel?

A. Eighteen or twenty miles, I guess.

Q. Wide?

A. Yes, sir.

Q. Are you quite certain about that?

A. It depends a little on what you call a boat of large capacity. Such boats as some which are upon the lakes now couldn't have traveled around there anywhere; that is, through the entire length of the lake, but many such boats as ordinarily pass up the lake might have traveled over a very large portion of the lake with entire safety if they so desired.

Q. Are there flats or marshes in St. Clair lake on the Canadian side?

A. On the Canadian side of the delta, just as there are on the American side of it and all through it.

4101 Q. On both sides of the lake, the American and the Canadian there are considerable marshes?

A. In the upper portion of the lake.

Q. Where the water is quite shallow?

A. Oh, the depth varies from one to ten feet perhaps.

Q. The lake has upon it in the proper seasons and especially during the summer, a very large number of men who gain their livelihood by fishing, hasn't it?

A. There is considerable fishing in the delta at the upper end of the lake and very little, if any, at the lower end or below the middle of it, in fact, below a third of the way down.

Q. On the flats of Lake St. Clair there are a number of club houses and summer resorts?

A. The flats of Lake St. Clair are the delta of the St. Clair river, and there are a number of summer resorts there.

Q. In fact, a number of club houses?

A. Yes, sir.

Q. It is quite a place of resort for the people of Detroit and the surrounding country during the seasons when such resorts are used and open?

A. Yes, sir.

Q. And a large number of people are there daily?

A. Well, it depends upon what you call a large number.
4102 If you should compare it to the population of Detroit I should say it wasn't a very large number, or even if you were to compare it to the population of Port Huron, I wouldn't say it was a large number.

Q. There are three or four thousand people up there in the summer every day?

A. I question it. I doubt it. I am quite sure it is not ordinarily the case that any such number of people are there.

Q. During the summer seasons aren't the flats of Lake St. Clair, its marshes, frequented by from two to three thousand people daily, at the resorts and in the club houses and in the occupation of fishing?

A. That is a larger number than I should estimate were there.

Q. Well, there is a considerable number?

A. There is a considerable number there, yes.

Q. And the considerable number varies from day to day as to the individuals?

A. Yes, sir; usually.

Q. So that there is a considerable number of constantly changing population upon Lake St. Clair during the summer seasons?

A. Yes, or upon the upper portion of Lake St. Clair. That is, upon the delta of the St. Clair river.

Q. And the dejecta of these people goes directly from all those people directly into the water, doesn't it?

4103 A. I think that that is generally the case. In fact, I know of no other deposition of it.

Q. Now, as you go from Detroit toward Lake Huron you pass through, first, the Detroit river?

A. Yes, sir; a portion of it.

Q. How far is it from Detroit to the head of the Detroit river in Lake St. Clair?

A. You mean from Detroit, or from the intake of the Detroit Waterworks?

Q. Well, from the intake of the Detroit Waterworks?

A. Oh, you would be in Lake St. Clair in going a mile above the Detroit Waterworks. In fact, I think in going half a mile.

Q. You would probably be in Lake St. Clair?

A. Yes, sir.

Q. Then you travel across Lake St. Clair how far going to St. Clair river?

A. Oh, about 24 miles across.

Q. How far would you travel by St. Clair river until you came to Port-Huron the point opposite the mouth of the Black river in the St. Clair river?

A. That is about 23 miles.

Q. When you are in the channel of the St. Clair river, how far are you from the harbor—

A. Excuse me; I wish to correct that statement. It is a little over 30 miles. 4104

Q. When you are in the channel of the St. Clair river, how far are you from the landing place of boats in Port Huron?

A. In Port Huron, the channel practically extends almost all the way across the river, so that you might say you are either at the landing place or fifteen hundred feet away from it.

Q. Now, the St. Clair river is the outlet of Lake Huron, Lake Michigan, Lake Superior and all their bays and estuaries, on the travel of the waters of those three lakes to the sea?

A. At the present time it is the outlet of practically all of them, except the Chicago river.

Q. At Port Huron, how wide is the St. Clair river?

A. Oh, it is about eighteen hundred feet, or fifteen or sixteen, or perhaps two thousand feet wide there in places. It varies somewhat.

Q. Is it confined there by precipitous banks, or does it spread out in marshes on either side?

A. I should hardly consider that either description suited the case. The land, while not high, has a well defined border, and the variation of the stage of the river is quite limited.

Q. The St. Clair river is not subject to very great variations upon the gauge, is it? 4105

A. No more than the Great Lakes.

Q. And that variation upon the Great Lakes is how much?

A. About six feet.

Q. The variation at different times from extreme low water to extreme high water, is a variation of about six feet?

A. I believe so; about that. I believe such variations have been recorded.

Q. Those variations in the St. Clair river are not sudden and violent?

A. No, sir.

Q. But are very gradual?

A. Quite gradual.

Q. And if not observed by some physical object as a gauge for instance, would be imperceptible?

A. Yes, just as it would be in any stream. I don't see how a person looking at the surface of a stream could possibly tell whether it was high or low, if he wasn't familiar with the stream previously or had objects of reference.

Q. You think if you approached a stream to which you were a stranger that you couldn't tell by observation of its surface, whether it was high or low?

A. It would depend very much upon the character of the stream. I think it would be very difficult for a person to
4106 approach the St. Clair river and tell whether it was high or low without having some object to refer the surface to.

Q. Have you a sufficient knowledge of the Illinois river to know, whether if you had seen it for the first time, you could tell from the surface whether it was high or low?

A. I think I could in certain localities.

Q. Are you familiar with the data or measurements of discharge and velocity by which the cubic feet per second of the flow of the St. Clair river is ascertained?

A. I am.

Q. Where did you obtain this data?

A. From conversations with the men who were carrying on the work who have been intimate acquaintances of mine for a number of years, and from the reading of their reports and the examination of the data of the discharges, in their offices.

Q. And you state that discharge to be how much?

A. It varies from 180,000 cubic feet per second up to 200,000, according to the best information we have in our possession at the present time.

Q. Do you state that as the average, and do you understand that as the average flow or discharge?

A. The average flow is somewhere in the neighborhood of 200,000 cubic feet per second. I have not examined to ascertain what the probable low water or probable high water flow 4107 would be, but through such stages as have been observed, the discharges vary between the limits stated.

Q. If the discharge of the St. Clair river was 180,000 cubic feet per second, you may state whether or not the discharge in 24 hours would be 25,920,000 feet, or whether it would be a very much larger number?

A. It would be considerably larger.

Q. What is the amount of discharge, if you have made the calculation, for 24 hours?

A. About 15,000 million.

GENERAL CROW: Cubic feet?

A. Yes.

JUDGE JOHNS: Are you familiar with the discharge or volume of the Mississippi river at St. Louis per second?

A. I have information which enables me to state the approximate discharge of the Mississippi river at St. Louis under certain conditions, at least.

Q. Well, state what the discharge is, and what the conditions are.

A. At ordinary stages, that is, those which exist during the greater portion of the year, the discharge is between 180,000 and 200,000 cubic feet per second.

Q. Where did you obtain that data?

A. From the reports of the Mississippi river commission 4108 and of the United States Corps of Engineers.

Q. What would you call an ordinary stage of the river?

A. The stage which exists through the greater portion of the year.

Q. How many feet upon the gauge would be marked at an ordinary stage of the river?

A. I am not prepared to say at the present moment, without looking up the gauge records. I will answer that question for you after I have had an opportunity to examine them.

Q. Did you make any investigation of the reports of the

Mississippi River Commission, from which you arrived at the discharge in the Mississippi river of 180,000 feet per second, or did you assume that was correct?

A. I found recorded gaugings of the river which indicated a discharge in the neighborhood of that amount.

Q. Did you find reports which indicated a very much less amount at times?

A. I did.

Q. Did you find reports which indicated a very much greater amount at times?

A. I did. I found reports which indicated discharges of less than half this quantity, and which indicated discharges of more than twice this quantity.

Q. For how many times in the year did you find from
4109 investigation of the reports of the Mississippi River Commission that the discharge of the Mississippi river was substantially 180,000 cubic feet per second?

A. Oh, in some years the discharge of the Mississippi river has varied between 180,000 and 200,000 cubic feet per second, for pretty nearly half the year.

Q. In what year?

A. I am not prepared to state at the present moment.

Q. What seasons of the year?

A. The seasons of medium stage.

Q. Fall, winter, spring or summer?

A. Sometimes in the fall and sometimes along in the winter, and sometimes in the late summer. The high stage is ordinarily May and June.

Q. Can you name any day in any year or any month in any year, in which the discharge of the Mississippi river was 180,000 cubic feet per second?

A. I don't know that I can name any day, month, time or week when the discharge of the Mississippi was exactly 180,000 cubic feet per second.

Q. Well, substantially 180,000 cubic feet per second.

A. That is at St. Louis of course?

Q. At St. Louis, yes?

A. August 5th, 1881, the gauging of the Mississippi river
4110 at St. Louis shows 179,000 cubic feet per second.

Q. Do you find any in 1900?

A. I do not. I haven't with me the reports of the gaugings for 1900.

Q. Did you investigate the reports of the gaugings for 1900?

A. If there were any published I investigated them. I am not sure there were any as late as that.

Q. As 1901?

A. The same answer would apply to 1901.

Q. And also for 1902?

A. I am quite sure I did not investigate any for 1902.

Adjourned until 2:30 p. m., same day, Wednesday, May 27, 1903.

4111 Southern Hotel, St. Louis, Missouri. 2:30 p. m., Wednesday, May 27, 1903. Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

GARDNER STEWART WILLIAMS resumed the stand for further cross-examination, by Judge Johns, and testified as follows:

THE WITNESS: If I may, I would like to make a correction as to my testimony this morning in regard to the population of Port Huron. I find the population to have been about 18,000.

JUDGE JOHNS: In 1890, according to the census?

A. I believe that is taken from the United States Census, although I will not be positive, because I also took information from the state census of 1894, and it may have been from either source, though I think it more probably from the United States census.

Q. Does the city of Port Huron have a sewerage system which discharges itself into either the Black river or Lake St. Clair?

4112 A. The city of Port Huron has had for a number of years a sewerage system, the discharge being into the Black river.

Q. Did it have such sewerage system in 1901 and 1902?

A. It did.

Q. What amount, in cubic feet, would there be in Port

Huron for one year, of fecal and urinal discharge into the sewers?

A. I will be unable to answer that question, because I am not informed of even approximately the number of persons who use the sewers of Port Huron, and therefore it would be impossible for me to make an estimate in answer to the question.

Q. Had you in 1890 or 1891 or 1892, sufficient familiarity with the city of Port Huron to make a guess as to the number of people whose sewage was discharged into the sewers of Port Huron?

A. I think not.

Q. Then as to the volume or amount of such discharges, you have no kind of an idea?

A. No, sir; except that there were such discharges.

Q. Suppose that we assume, for the matter of convenience that 9,000 of the people of Port Huron, discharged their household sewage into the sewers, would you think that was a large or a small estimate?

A. I should be inclined to think that for 1890, that was a large estimate. 4113

Q. Would you say, in your best opinion, that it would be fair to estimate that 5,000 people discharged their household sewage into the sewers of Port Huron in 1890, and 1891?

A. I think it is possible that that number of persons may have discharged sewage into the sewers of Port Huron in those years—wait a minute, let me have that quesion.

(Queston repeated.)

A. That is all right. That is as I understood the question.

Q. If such assumption is fair, what amount in cubic feet would you estimate there was, of dejecta and urinal discharges from those 5,000 people, making the estimate upon some basis which engineers or sanitarians assume?

A. I will have to do a little figuring on that. I cannot say off-hand. Is this per year?

Q. Yes, in the first instance?

A. Oh, between 6,000 and 7,000 cubic feet. That is of the solid matter.

Q. Solid matter?

A. Yes.

Q. How many cubic yards would that be?

A. Oh, about 230 to 250, or less than one-half the amount, or about one-half of the amount that was usually dredged in a day during the dredging of the Black river in 1892.

4114 Q. Then one-sixth of that 230 or 250 cubic yards would be fairly attributable to the months of April and May in 1892, with reference to the time when dredging was done there?

A. I should expect that the same proportion,—that is, it would be fair to make division of the amount that I have computed by "6" to get the probable delivery in the two months of the year in quesion.

Q. Or, substantially, in round numbers, 40 cubic yards in the two months?

A. Just about that substantially, yes, sir.

Q. I call your attention to your testimony of May 26 on the second page (handing witness record) and ask you to tell me how many cubic yards were dredged out of the mouth of the Black river and the harbor of Port Huron during the month of April, according to the figures you have given there; that is, assuming an equal amont for May as in April, as you have given it?

A. The number of cubic yards dredged out of the Black river during the month of April—

GENERAL CROW: Dredged what—what material?

A. Of material of all sources dredged out of the Black river in the month of April, 1892, was about 5300 yards roughly —5295 yards, I believe.

Q. That would be 10,600 yards substantially in round numbers in April and May, of dredged material?

4115 A. I think it would be considerably more than that, as they dredged practically all of May, while they only dredged half of April.

Q. I am asking you on the basis of your testimony yesterday, assuming a similar amount for May.

A. I said, continuing in similar quantities, meaning similar quantities per day or per week; that is what I meant by the testimony.

Q. You appear to have obtained these figures from a book from which you read; what is that book?

A. That is a note-book of my own into which I made transcripts of the record of the inspector, or such parts of it as I desired for my information.

Q. In that book you transcribed the figures of some United States officer from some book kept by him?

A. Yes, sir.

Q. And correctly transcribed the number of yards dredged with the date?

A. To the best of my belief I did.

Q. And you are refreshing your recollection and testifying from memoranda made by you in 1896 or 1897?

A. I think this memoranda was made in 1898.

Q. In 1898?

A. Or, it may have been as early as 1897.

4116 Q. Which memorandum was copied from some memoranda made by some United States officer at some other time?

A. Yes, during the period of the dredging in question.

Q. Whether those memoranda from which you copied, were memoranda made in the proper official discharge of the duties of such officer you do not pretend to say?

A. The inspector who had charge of the work informed me that they were his daily records of the work done, from which he made up his official reports.

Q. And you assumed that to be correct?

A. I assumed that to be correct. I see no reason for doubting it.

Q. Of the assumed 10,600 yards of material dredged from the harbor of Port Huron, some forty-odd cubic yards might possibly be a fair estimate of the amount of solids in the household sewage coming from the bodies of persons using the sewers of Port Huron?

A. I would say that I think that 40 cubic yards of about 15,000 yards would be a correct statement of the case, or an approximately correct statement of the case.

Q. Well, assuming that the sewage discharge of the kind spoken of—household sewage, in solids, was 230 to 250 cubic yards per year, you would have a fair estimate, you think, of the solids in cubic yards, for the city of Port Huron during 4117 the year?

A. I think it is a reasonable estimate.

Q. Now, what do you estimate to be—

A. Beg pardon. That is, I think it is a reasonable estimate for the fecal discharge.

Q. Yes, for fecal and urinal discharges?

A. Yes, sir.

Q. Now, what do you estimate to be the fecal and urinal discharges of the people of Chicago, using the sewers of Chicago, which are emptied into the drainage canal, for one year?

A. About 4400 cubic feet per day.

Q. For how many inhabitants?

A. I didn't include the urinal matter in that estimate. Nor did I endeavor to be accurate in the amount of urinal matter in the estimate in regard to Port Huron.

Q. Well, you understood that as to Port Huron, the urine was included in the estimate?

A. I understood that was included in the question.

MR. JEFFRIES: Just let the witness explain his answer.

THE WITNESS: I was just going to say that owing to the extreme difficulty of estimating accurately the solids in urine, I did not attempt to make any accurate, positive estimate thereof, and used virtually the same figures that I did in estimating the discharge in Chicago.

4118 Q. JUDGE JOHNS: What do you estimate to be in cubic yards, the fecal and urinal discharge of the people of Chicago who use the sewers of Chicago, which flow into the Drainage Canal for one year?

A. About 60,000.

Q. Cubic yards?

A. Yes, sir.

Q. For one year?

A. Yes, sir.

Q. That would be about 5,000 yards for one month, would it?

A. Yes, sir.

Q. Or 10,000 yards for two months?

A. Yes, sir.

Q. Well, then, such solid discharges into the sewers of Chicago from the bodies of the inhabitants, which sewers enter into the canal are not five times as much as the entire amount dredged at Port Huron?

GENERAL CROW: For what period, judge?

JUDGE JOHNS: For any period, five minutes or five years.

A. No, sir; they are not.

Q. Give me the exact number of cubic feet of flow in the St. Clair river and the Mississippi river, assuming 180,000 cubic feet per second, your answer this morning being about 1500 millions.

4119 A. I haven't the figures that I made. I can make them over again for you. Do you ask for it per day?

Q. Yes, first per day?

A. Well, that is what you desire now?

Q. Yes, sir?

A. 15,552 million.

Q. And for sixty days, being the months of April and May in 1892, how many cubic feet would that be?

A. Sixty days?

Q. Yes, sir?

A. 933,120,000,000.

Q. That is 933,120,000,000?

A. Yes, sir; if you use that notation.

Q. If such a body of water were regularly and continuously polluted one part in one million, how many cubic feet of pollution would have to be put into the water each day to make one part?

A. On that assumption, 15,552 cubic feet.

Q. That is to say, in order to regularly, systematically and scientifically pollute the body of water flowing past Port Huron in the St. Clair river, for one day of 24 hours, there would have to be 15,552 cubic feet of polluted matter to make one part in a million of pollution?

A. That is correct, sir.

4120 Q. Now, assuming that it was fair to say that there were 15,000 cubic feet of solids dredged out of the harbor of Port Huron and the mouth of the Black river in the months of April and May, 1892, that entire solid matter would not pollute that body of water if regularly and continously put in in equal quantities and in constant, flowing succession or volume, for much more than one day would it, on the basis of one part per million?

A. Understanding the phrase of the question on the basis of one part per million to mean to the extent of one part per million, which I judge is what you mean—

Q. Yes, sir?

A. It would not, but it is to be remembered that the quantity of material dredged from Black river and discharged into the St. Clair river at Port Huron in 1892, was not 15,000 cubic feet during the months of April and May, but 15,000 cubic yards which is 27 times as much as has been assumed in the quesion.

Q. Then if 15,000 cubic yards were regularly and systematically in a constant and regular flow, put into the waters of the St. Clair river at Port Huron, such discharge would not pollute the water of St. Clair river for more than 27 days, would it?

A. It would pollute it as long as it were put in.

Q. At the point at which it was inserted, would it pollute
4121 it there for more than 27 days?

A. Understanding your question to mean, would it pollute it at the rate of one part per million?

Q. Yes?

A. I would say that such pollution would last for 27 days.

Q. What per cent. of pollution of 933,120,000,000 cubic feet of water is 40 cubic yards of solid material, stated in parts per million?

A. About 108-10,000.

Q. 108-10,000, of one per cent.?

A. 108-10,000, of one part per million.

Q. Do you want to be understood as saying on the basis of these figures, that if there was the dejecta of two typhoid patients put in some time about the first of April, 1892, in 40 cubic yards of solid sewage, from the bodies of people, in 933,120,000,000 cubic feet of water which would travel 57 miles, that that dejecta would pollute the entire body of water during any considerable portion of that time, or any portion of it?

GENERAL CROW: Complainant objects to a question of that kind for the reason that the witness did not state that, according to the official record, there were only two cases prior to Aprii, 1892, and that the question therefore is based upon an assumption of facts that has no existence in the record
4122 and there is no evidence tending to show that.

Q. (Question repeated)?

A. Considering the fact that the number of bacteria found in the excrement of typhoid patients has been on the average about 200,000 million per day, and that if these patients were sick with typhoid fever and recovered, they would each have been discharging that excrement so charged with infection, for a period of 60 days, and considering that there were assumed to be two patients, we find that there would have been probably discharged into the sewers of Port Huron, and from there possibly into Black River and the material dredged therefrom, 24 million million bacteria, which would have been sufficient to have put about 27 bacteria into every cubic foot of water discharged under the conditions assumed, and it therefore seems to me possible that the infection might have been so distributed.

Q. Does it therefore seem to you probable?

A. I think it is within the realm of probability, assuming that there is no error in the arithmetical computations upon which I based my former answer.

Q. In 1892, in March, April and May, how many cubic feet of water were pumped into the Detroit waterworks, assuming 7 and one-half gallons to a cubic foot?

A. During March, April and May?

4123 Q. Yes, the average per day.

A. You only want the approximate figures?

Q. Certainly.

A. The average for that time per day, you say?

Q. Yes sir.

A. About 4,600,000 I think,—say four and one-half million.

Q. Cubic feet?

A. Cubic feet, yes sir.

Q. Then assuming that the volume of water in the St. Clair river passing Port Huron in a day was 15,552 million, what per cent of it was pumped into the Detroit Waterworks?

A. Three-hundredths of one per cent I think.

Q. Twenty-seven bacteria or typhoid bacillus to a cubic foot of water would be about four individual, separated bacteria roughly speaking, to a gallon.

A. Yes.

Q. Assuming that the number of bacteria you have mentioned, namely, 27 to a cubic foot of water, was equally distributed throughout the entire volume of water flowing out of the St. Clair River into the Lake St. Clair, and there from through the Detroit River to the intake at Detroit, do you want to be understood as saying that those four bacteria in a gallon of water traveling 57 miles would live and be virulent?

A. I see no reason why some of them might not live and
4124 be virulent.

Q. Do you see any reason, based on any prior knowledge, why they should? I am not asking you for details of any specific case, but on any knowledge that you have now, of the state of the science or art prior to May, 1892, do you see any reason why they should?

A. Yes, I do. In 1888, experiments showed that in ordinary potable waters the germs had been found alive after two weeks, and it would not take them two weeks to come from Port Huron to Detroit under the circumstances assumed.

Q. That was in laboratory experiments?

A. That was a case of ordinary potable water.

Q. In a laboratory experiment?

A. It was a laboratory experiment, certainly; but the relation of laboratory experiments to the conditions existing in nature seems to me to be very much like the relation of the life of beasts in captivity and their life while in nature, and I can see no reason to expect that the longevity of these germs in the laboratory would be any greater unless provided with special food to prolong life, than would be the case in the natural waters.

Q. With the state of the science or art as it existed and is known to you now, in 1892, do you know of any reason why
this supposed number of bacteria,—four to a gallon,
4125 should live in running water for a distance of 57 miles?

A. I certainly know of no reason why they should not.

Q. Do you know of any reason why they should in running water?

A. Any more than that it is the law of nature for living organisms to exist until some cause sets about to cause their destruction or death.

Q. Does being cast into an unnatural medium create, in your mind, any reason why they should die in that medium?

A. Reasoning by analogy, bearing in mind that ordinary vegetables live for very long periods in what may be termed unnatural media, I see no reason to suppose that they would necessarily die under the circumstances you suggest.

Q. If an ordinary vegetable removed from the garden was cast into water and set afloat, would it live?

A. Some of them would for a considerable time. I don't think many of them would die within a couple of weeks.

Q. Would an ordinary water plant, having its medium or natural habitat in running water, if cast into coal oil, live?

A. I am unable to say, as I never heard of the experiment being tried.

Q. Do you know when these two people died of typhoid fever, in Port Huron?

A. I don't know that they died.

Q. You have heard that they died?

4126 A. No sir.

Q. Do you know then whether these two cases of which you have heard, recovered?

A. I do not.

Q. Do you know whether the discharges from their bodies were cast into the sewers of Port Huron?

A. I do not.

Q. Do you know whether the discharges from their bodies were destroyed?

A. I do not.

Q. Or disinfected?

A. I do not.

Q. Then not knowing whether there was any typhoid dejecta in all the mass of stuff taken from the harbor of Port Huron and the mouth of the Black River, do you still wish to be understood as saying that a typhoid epidemic in Detroit was created by the dredging of the harbor of Port Huron and the mouth of the Black River?

A. Considering the fact that in a population of 18,000 souls, many of whom were railroad employes, passing back and forth from one place to another, and exposed to the liability of becoming infected with typhoid; knowing full well that even in cases of epidemics when an especial effort is made to get a report of all the cases, that statistics show that rarely 4127 are more than sixty per cent of those cases obtained; having in mind also the possibility of the existence and passage through the intestinal tract of man of the typhoid organisms in its vital state, without causing therein any inconvenience or disease to the patient; having in mind the existence of so-called cases of walking typhoid; having in mind too, the fact that prior to 1897 there was no rigid requirement in force as to the registration of vital statistics, or the reporting of cases of typhoid in the State of Michigan,—it seems to me far less reasonable to assume that there were no other cases in Port Huron than those of which I received information during the time under consideration, than it is to assume that the infection from those cases reached the sewers of Port Huron and ultimately the people of Detroit.

JUDGE JOHNS: I move to strike out the answer as wholly irresponsive to the question.

Q. Without stating what you may have in your mind, do you wish to be understood as a sanitary expert, epidemiologist and sanitary engineer that under the facts and figures elicted by your cross-examination, you are still of the opinion that typhoid fever resulted from the dredging of the harbor of Port Huron, and the mouth of the Black River in 1892?

A. I wish to be understood as saying that it is my belief that the typhoid fever in 1892 was very largely caused 4128 by the dredging of Black river in Port Huron during the same year.

Q. Is the Detroit case regarded as a classic in sanitary science?

A. I couldn't say.

Q. Are you responsible for the story going about in scientific sanitary circles concerning the epidemic in Detroit and its origin?

A. I don't know what story is going about in scientific circles concerning that epidemic. I investigated that epidemic and the results of my investigation have been given here.

Q. Did you make a report which got into print, of your investigation?

A. In an address which I delivered before a sanitary convention held under the auspices of the Michigan State Board of Health, in Detroit, I enumerated or outlined the essential facts concerning this epidemic and my conclusions in regard thereto, and afterwards repeated those statements before another assemblage.

Q. Did those statements get into print?

A. The Michigan State Board of Health published the remarks which I made at that time before the Sanitary Convention as an appendix to the report of the State Board of Health.

Q. Assuming that 5,000 cubic feet of human discharge are put into the sanitary canal or drainage canal in Chicago
4129 in one month and was there diluted with 300,000 cubic feet of water per minute as it continuously flowed into the sanitary canal and then traveled 357 miles, partly down the Illinois river, and in the Mississippi River to the intake, and by the time it arrived at the intake, was thoroughly mixed with the waters of the Mississippi river at the intake, arriving continuously during the month and being diluted so that during the month it was contained in 933,120,000,000 cubic feet of water, during the same month, do you think that that sewage would pollute the intake waters at St. Louis?

A. You mean the water at the intake or in the intake?

Q. Yes?

A. Understanding the word "pollute" to mean the addition to water of filth and infectious matter or both, whether in large or small degree, I do.

Q. Assuming that stated in the form of a solid mass, the dejecta and urine of a human being put into the sanitary canal at Chicago amounted in a month to 5,000 cubic feet, and that it was diluted with 300,000 cubic feet per minute, each minute of the month, of water, and that it traveled 357 miles to the intake at St. Louis, receiving in 317 of those miles the dilution of the tributaries of the Illinois river and receiving at the mouth of the Illinois river the dilution of the Mississippi river

and that when it arrived at the intake in the regular course
4130 of arrival during the month, it had been mixed with and
constituted a part of 933,120,000,000 cubic feet of water; do you wish to be understood as saying that if during that month in Chicago there were 75 deaths from typhoid fever whose dejecta were put into the water during that month that those bacilli in that dejecta would have a poisonous effect or any deleterious effect upon the waters at the intake at St. Louis?

A. I do, to whatever extent they might arrive there.

Q. Do you want to be understood as saying that they might arrive?

A. I do.

Q. Considering all that you know, or that can be learned of sanitary science, and considering also the fact that with the exception of the Detroit case no bacilli of typhoid fever have been supposed to travel over 30 miles in running water, on what do you found that conclusion?

GENERAL CROW: The complainant wants to interpose an objection to that question because it assumes facts that are at war with the evidence in this case, for they witness that the witness' own testimony, uncontradicted, shows that the bacilli have traveled a distance of 60 miles in the Crookston case in Minnesota.

MR. JEFFRIES: And the complainant makes the further objection that the question is ambiguous.

A. I base that conclusion upon my knowledge of the life
4131 of the typhoid germ in water as determined experimentally; upon my knowledge of its transmission in the epidemic of Detroit, and epidemics other than Detroit; upon my knowledge of the conditions affecting the water supply of St. Louis previous to the opening of the Chicago Drainage Canal; upon my knowledge of the conditions existing in and about Chicago previous to that time; upon my knowledge of the conditions existing in and about St. Louis since the opening of the said drainage canal, and the conditions existing in and about Chicago since the opening of the said drainage canal, whence it appears clearly to my mind, that there has as yet been found no other explanation sufficient to account for the increase now

amounting to about 100 per cent in the number of annual typhoid deaths in the city of St. Louis, as compared with the annual number recorded during the five years previous to the opening of the drainage canal, other than that the said infection has been received from Chicago through the drainage canal, the Illinois river and the Mississippi River, and that therefore if much may come, it must necessarily follow that little may also come.

Q. How did you calculate the percent of increase of deaths from typhoid fever in St. Louis?

A. I said 100 per cent increase in the annual number of deaths, that is, irrespective of population, which is com-
4132 puted as follows: The average number of deaths annually from typhoid fever recorded in the city of St. Louis from 1895 to 1899 inclusive was 112, and the number recorded during the year 1902, from the same cause, in the same city, was 222, which is substantially an increase of 100 per cent.

Q. Where is Crookston, Minnesota?

A. It is up in the Northwestern part or a little north of the central portion of the western half of Minnesota, pretty well over toward the line.

Q. How far from St. Paul?

A. I couldn't say at the present moment.

Q. Were you ever in Crookston?

A. No sir.

Q. Where did you get your information about Crookston?

A. In published reports.

Q. What published reports?

A. Published reports of the epidemic at Grand Forks.

Q. In what publication is this set out?

A. In the Engineering News for one, and I believe it is also referred to in some of the Health Reports of Dakota.

Q. Of Dakota?

A. I won't be positive in regard to that. I have seen it referred to in some of the health reports.

Q. Is Crookston in Minnesota or Dakota?

4133 A. Crookston is in Minnesota.

Q. And Grand Forks is where?

A. North Dakota.

Q. Did it appear in the reports of the State Board of Health of Dakota?

A. I couldn't say.

Q. Did it appear in the reports of the State Board of Health of Minnesota?

A. I couldn't say.

Q. Do you remember where you did see the report of this thing?

A. I saw it in the Engineering News and I also have seen it referred to elsewhere, but I cannot recall where.

Q. When did you see it in the Engineering News?

A. I think it came to my attention along somewhere in 1897 or 1898, I think probably in 1898.

Q. Do you know when it was published in the Engineering News?

A. In 1893 or 1894.

Q. Is the Engineering News a weekly paper or monthly paper?

A. It is published weekly now and I believe it was at that time.

Q. Where?

A. New York.

4134 Q. Who was the author of the publication in the Engineering News?

A. The City Engineer of Grand Forks.

Q. Have you a copy of the Engineering News from which you derived that information?

A. I have at my home.

Q. You made no personal investigation of the epidemic at Grand Forks?

A. Further than to talk about it with my friend, Professor Vaughan who was one of those who investigated the cause, concerning it.

Q. You did not as a matter of fact, yourself, make any kind of a personal investigation of the locality where it occurred?

A. I never was in Grand Forks or Crookston, or along Red River; if that is an answer to your question.

Q. Is it Red River or Red Lake River?

A. Red Lake River into which the sewage was discharged.

Q. So that all you know about Crookston is, what you saw in some periodicals, the Engineering News, preferably, and what a gentleman named Vaughan told you?

A. And what I am quite sure I saw in regard to it in another reference, which, however, I am free to state was

4135 not an original description of the epidemic.

Q. Had there been typhoid fever in Crookston?

A. It was so stated.

Q. How many cases?

A. I believe the report says there had been about sixty cases.

Q. Is that where the typhoid epidemic of which we are talking, originated?

A. That is the supposition.

Q. The cause of it?

A. The cause of it.

Q. The deaths occurring in Grand Forks of which we have been talking?

A. Yes sir.

Q. Do you know of that sixty supposed cases, how many of them occurred in any one month?

A. I do not. The statement is that they occurred during the months of October and November, I believe, as I remember the report.

Q. How many deaths were there from those sixty cases?

A. I don't know that. I have never seen it stated, but it is my impression that if there were any deaths they were rather few, although at the present moment I have no definite knowledge on the subject.

4136 Q. How large a place is Crookston?

A. At the present time I couldn't say positively, but my impression would be that it has probably somewhere between three and six thousand inhabitants.

Q. How many population did it have according to the census of 1890?

A. I couldn't say.

Q. Have you ever seen any statement of the amount of population at Crookston, at the time that the sewer became broken there or clogged?

A. I don't recall whether I have or not.

Q. Do you know what proportion of the people of Crookston have their household sewage emptied into the sewers?

A. I do not.

Q. Do you know whether any one of the supposed sixty cases, had their dejecta thrown into the sewer?

A. I do not.

Q. Do you know whether the city in any part has sewers?

A. It was so stated in the report of the outbreak.

Q. Whether that report is true, you do not know?

A. No more than I know that such reports are generally true or false, according to the intrinsic evidence of reliability which they bear.

4137 Q. What kind of a river is Red Lake River?

A. Red Lake River is a river about 200 miles long, has a considerable fall and moderately rapid velocity.

Q. Has it any known rate of discharge in cubic feet per second?

A. When it is at a low water stage, its discharge has been shown to be or calculated to be 988 cubic feet per second, or thereabouts.

Q. And Grand Forks was sixty miles from it, from Crookston?

A. I believe so, about that.

Q. Is the lake between Crookston and Grand Forks?

A. I am not aware that there is.

Q. Do you know whether there is a lake or a pond there called Red Lake?

A. There is such a lake or pond somewhere near the head waters of the stream.

Q. Whether Crookston is above that lake or below it on the stream, as the current flows you do not know?

A. My impression is that it is below.

Q. Do you know whether there were any cases of typhoid fever in Crookston the year prior to 1893, or in 1892?

A. I do not.

Q. Do you know whether there were any cases of typhoid fever there in January, February or March of 1893?

4138 A. I do not.

Q. Do you know whether there were any typhoid cases there in April, May or June, 1893?

A. I do not.

Q. Do you know whether there were any typhoid cases there in July, August or September?

A. I don't know positively, but considering the fact that there are reported to have been in October and November, 60 cases—

GENERAL CROW: What year?

A. In October and November, 1893, it would be remarkably strange, and almost a single instance of the kind in the history of typhoid fever, if there were not cases of typhoid fever there during July, August and September preceding.

JUDGE JOHNS: Have you any idea where the contagion came from that caused the supposed cases in Crookston?

A. I have not.

Q. Or whether that was a water-borne infection or not?

A. I have not.

Q. Would it be safe to assume that the infection which caused the disease in Crookston was water-borne?

A. I shouldn't wish to make that assumption absolutely without further knowledge of the conditions existing there.

Q. If it should happen that the infection in Crookston
4139 was a water-borne disease and infection, would it be fair
to assume that the infection went down the river from there to Grand Forks?

A. If the infection at Crookston came from an infection transmitted by the water of Red Lake River, it would be fair to assume that the infection would continue and probably did continue on down the river to Grand Forks, and I think that it is highly probable that such was the case, in view of the fact that the amount of typhoid fever prevalent in Grand Forks during the early and middle parts of 1893, was in excess of that which has been prevalent there since 1894, after which time the water supply has been filtered and therefore a reasonably pure supply, and it would seem quite clear therefore, that the excess previously existing was due to the infection of the water and might either have come from above Crookston, or come from disease existing in Crookston, the infection being discharged in limited quantities into the stream at that place.

Q. Does Crookston take its water supply from Red Lake River?

A. I don't know.

Q. Does Grand Forks take its water supply from Red Lake River?

A. It takes its supply from the river. I am under the impression that Grand Forks is at a junction of Red Lake
4140 and Red River, and I am uncertain whether the intake is in one or the other, but I understand that it is in the same place that it was previous to the outbreak of typhoid in 1894.

Q. Do you know where the intake of the waterworks in Grand Forks, if there be such a thing, is with reference to the mouth of Red Lake River?

A. I do not.

Q. You could not tell whether it is below or above the mouth of Red River?

A. I am not able to say at the present moment.

Q. Now how large a stream is Red River, which flows past Grand Forks?

A. I believe it is in its upper reaches a smaller stream than Red Lake River; that is, that Red Lake River is the larger stream.

Q. It is designated as Red River below Grand Forks?

A. I believe so.

Q. Now how much of the Red River is above Grand Forks in miles?

A. I couldn't say.

Q. Do you know whether in 1893, in September, October and November there was any typhoid fever above Red River?

A. I do not.

4141 Q. Do you know whether there were any towns or populous communities above Grand Forks on the Red River in Dakota?

A. I do not, but my impression is that there are not.

Q. That is an impression and not any actual knowledge at this time I suppose,—any positive knowledge?

A. General knowledge of the map of Minnesota, that's all. I may of course be mistaken.

Q. Does the Red River run mainly above Grand Forks in Minnesota or Dakota?

A. Pretty nearly the border.

Q. Is it a boundary stream between the two states?

A. A portion of it is I believe. That is my impression at the present moment.

Q. This occurrence in Grand Forks was before you were employed by the Board of Water Commissioners or the officials of Detroit, wasn't it?

A. No sir.

Q. Before you investigated the occurrence at Port Huron?

A. Yes sir.

Q. When did you make a careful investigation by books or written authorities of any kind first, of the state of affairs at Crookston and Grand Forks?

4142 A. In either 1897 or 1898, and I am not sure—it is barley possible I can give you the date. (Referring to memorandum book). I conclude from the entry in my notebook that it was in 1898.

Q. That you first became aware of it?

A. Yes sir.

Q. And your entire research and investigation in reference to it has been reading an article in the Engineering News, and some other indirect reference to the case in some other publication of which you cannot now state the name, and a conversation with a man named Vaughan, your friend?

A. My knowledge of the epidemic at Grand Forks which I have described, is based upon a description of the said epidemic which appeared in the Engineering News, and in which statement or description the authority of the City Engineer of Grand Forks was given as being the person responsible for the information, and from a conversation with my friend, Prof. Victor C. Vaughan, himself an eminent bacteriologist, analyst and I may say epidemiologist, who had been called in to advise in connection with the discovery of the cause of the outbreak and who gave me considerable information in regard to it, and I think indeed, that it was he who first called my attention to it, and I may add that I have also seen or heard reference to it elsewhere.

Q. And you did not hear from your friend professor
4143 Vaughan in reference to it until in 1898?

A. My impression is that I first heard of it in 1898. It is barely possible that I may have heard of it late in 1897, or sometime, even in 1899. I am prepared however, to state positively that I had at that time come to the conclusion which I still hold and should still hold, irrespective of any evidence that there may be on the subject in the Grand Forks epidemic; that the infection which caused the outbreak of typhoid fever in Detroit in 1892, came from the dredging in Port Huron.

JUDGE JOHNS: I move to strike out the answer, or that part which commences with the words "I am prepared."

GARDNER S. WILLIAMS.

ADJOURNED until 10:00 A. M., Thursday, May 28, 1903.

4144 Southern Hotel, St. Louis, Missouri. 10:00 a. m., Thursday, May 28, 1903.

Parties met pursuant to adjournment. Present the Commissioner and same counsel representing the respective parties.

GARDNER STEWART WILLIAMS

resumed the stand for further cross-examination by Judge Johns and testified as follows:

Q. Charlevoix is on the shores of Lake Michigan, is it not?

A. It lies between Lake Michigan and Round and Pine Lakes; practically on the shores of all three. Substantially you might say, generally speaking, it is on the shore of Lake Michigan.

Q. There is an outlet from Round Lake into Lake Michigan which has been dredged out?

A. Yes, that has been improved, to create a harbor. It was the natural outlet of Pine Lake.

Q. And Pine Lake has its outlet into Round Lake?

A. Yes sir.

Q. And above Pine Lake and extending up into the woods in Michigan, is a stream?

A. There are small streams flowing into Pine Lake; none
4145 of them very large. Boyne River is the largest.

Q. There is above Charlevoix, extending northeasterly up through the State of Michigan for about sixty miles, a chain of lakes which are connected with and have their outlet through Pine Lake, into Round Lake and Lake Michigan?

A. There is a considerable chain of lakes up in there; I think your statements are substantially correct.

Q. How large is Round Lake?

A. Round Lake is about a half or three-quarters of a mile in diameter perhaps.

Q. Have you visited Charlevoix?

A. Oh, yes; several times.

Q. How large a town is it?

A. Oh, it is hardly a town. It is a village, may be—I couldn't recall the figures on population, but I should say it might be 1200 to 2000, somewhere along in there; perhaps more.

Q. And in summer it is quite a popular resort?

A. Yes.

Q. The sewage from various hotels and boarding houses goes into Round Lake and thence out into Lake Michigan?

A. In some cases it goes into Round Lake. There are one or two sewers I think, that drain into Pine Lake. Those hotels and boarding houses, if they have sewers at all, have private sewers, or had up until quite recently. I think they have
4146 recently constructed a system of sewers up there.

Q. By boat it is about how many hours from Chicago?

A. I couldn't say. It is practically almost the full length of Lake Michigan; that is, when you get to Charlevoix you are almost up to the Straits.

Q. Well, you are about forty miles below the Straits?

A. Yes, something of that sort.

Q. It is quite a resort for people of Chicago?

A. Yes, quite a large number of people from Chicago and from Indiana. It is quite near Petoskey and Bay View which are generally full of summer resorters.

Q. Do you know whether there was any typhoid fever in Charlevoix the year that the United States boat came into Round Lake?

A. Previous to the coming of the boat, you mean?

Q. At the time of the coming in of the boat?

A. I know that typhoid fever had been practically unknown in the village up to that time. That was the first time that they had ever had any typhoid fever, that had attracted any attention from the physicians themselves.

Q. Well, had there been, in Charlevoix, typhoid fever prior to the coming in of this revenue cutter?

A. Not to my knowledge, and my knowledge would indicate that there had not been.

4147 Q. Whether there had been or not, as a matter of actual fact, you don't know?

A. I am not prepared to state positively.

Q. Now when was it this boat sailed into the harbor, of Round Lake, or steamed in?

A. My recollection is that it was either in July or August.

Q. Of what year?

A. Of 1897, I think. My testimony on this has been given wholly from memory, as my notes are at my home.

Q. Were you there at the time?

A. I was not.

Q. How long after the arrival of the boat were you in Charlevoix?

A. I was there the next spring.

Q. And in this case as in the other cases to which you have testified, you derived your information by inquiries of physicians and other people in the locality who are assumed to know the general condition of affairs?

A. I did, that being the usual method of investigation in such cases, it being impossible for a man to forestall an epidemic and be on the ground at the time that it occurs.

Q. How long was this United States Boat in Round Lake?

A. I think she was in there two or three days, but I am not certain as to that. She was there some little time.

4148 Q. Who was the man who had typhoid fever on board the boat?

A. I did not learn his name.

Q. Was he a seaman, an officer, or a passenger?

A. I could not state, but presumably he was one of the crew. In fact I think that statement was made to me, that he was one of the crew.

Q. Was the typhoid fever prevalent upon the boat or was this a single case?

A. It was a single case.

Q. The boat was in Round Lake?

A. Yes sir.

Q. And the dejecta of the typhoid fever patient was cast into the lake from the boat?

A. Presumably, as that is where the dejecta from boats goes—into the water in which the boat is.

Q. As a matter of fact do you know, or have you ever heard whether the excretions of this typhoid patient were destroyed on board the boat, or disinfected?

A. I never heard that they were or were not.

Q. Did you ever inquire about that?

A. I don't know that I ever did, inasmuch as I never met anyone whom I would consider competent to answer the question.

Q. Do you know what the practice and the rule of the United States Navy is with regard to the dejecta of men 4149 sick on board their boats in running streams, as to the destruction of the dejecta or its disinfection, if the man has some infectious disease?

A. I do not, but I should imagine that if they knew the man had that disease they would probably attempt to disinfect so far as the facilities at their hands would permit.

Q. Do you suppose that an officer of the United States Navy would allow the dejecta of a typhoid patient to be cast into the waters of a community which took its water supply from those waters?

A. I haven't any doubt of it.

Q. What?

A. I haven't any doubt that they would.

Q. What do you base that on?

A. Well, from my knowledge of the United States Naval officers, and their knowledge of these subjects generally; they know no more about them than the ordinary people, and it is only comparatively few people after all who today would think anything about that propostition and who would think of the seriousness of it.

Q. Don't you know as a matter of fact now, that the United States Naval officers—all of them, are taught the nature of infectious diseases, and the way in which not only to avoid them,
but to treat them and prevent them, and disinfect its sew-
4150 age on board their boats, as a matter of general instruc-
tion at the Naval Academy?

A. I should imagine that they would be so taught, but I don't know it.

Q. Well, do you presume the contrary?

A. I presume that the instructions so received are not sunk very deeply into their minds, so that in the average case they would not be likely to take especial precautions, unless it was called to their attention that the case in hand was a particularly dangerous one.

Q. Then your presumption is that an officer having a duty imposed upon him by the regulations of his office, and his oath as an officer, would wilfully and recklessly disregard his duty?

A. I don't presume anything of the kind.

Q. Now you never spoke to anyone in Charlevoix, to inquire whether the dejecta of this man went into this Round Lake or not?

A. Knowing the usage on board ships, of the disposal of dejecta, that is uniformly existent and knowing that the practice was to discharge dejecta from boats into Round Lake, I saw no reason to question the probable fact that the dejecta were discharged into Round Lake.

Q. And not knowing the usage on board United States
4151 boats in regard to the dejecta of people having infectious
or contagious diseases, you presumed for the purposes of the investigation, that the United States officer allowed that stuff to be cast into the water?

A. I certainly did, and I think it was a just presumption.

Q. Did you ever examine, as a sanitary expert, on water supplies, the regulations of the Navy of the United States, and of the Naval Department, with regard to this subject?

A. I never did.

Q. But, going to Charlevoix, and hearing that about seven or eight months before there had been a man on board a United

States steamer in that harbor who was said to be sick with typhoid fever, you attributed the increase of typhoid fever in Charlevoix to the excreta of that man?

A. Yes, and I think I was fully justified in so doing, considering all the other circumstances with which I was at that time familiar.

Q. At the same time you didn't know whether there was typhoid fever on Pine Lake, any estuary of Pine Lake, or in Charlevoix, one or more cases?

A. I found there was no evidence of there being one or more cases in any of those places, other than the one in question.

4152 Q. Round Lake and the channel leading from Round Lake out into the main lake is the harbor for pleasure craft in the summer?

A. More or less.

Q. And for steam launches which ply along that coast?

A. Yes sir.

Q. And for local boat lines?

A. Yes sir.

Q. And each day during the summer, two or three boats from various places along the shores of Lake Michigan come into Charlevoix, into Round Lake, do they not?

A. I think so, fully that number.

Q. And do you know whether there was typhoid fever on any of those boats?

A. Do I know whether there was?

Q. Yes?

A. I do not.

Q. Nor if any of the people who came from Chicago or elsewhere to Charlevoix, had typhoid fever, walking cases?

A. I think it is quite possible that people coming from Chicago might have had walking cases.

Q. And also it might be possible that some fellow slipped in there from Milwaukee, with a walking case?

A. Oh yes, it might be possible that some fellow slipped in.

4153 Q. Might possibly have come in from as far as Ann Arbor?

A. Yes, or any other place. In fact there were various ways in which typhoid fever might have gotten into that water. It evidently was in the water, and that was the most obvious way in which it could have gotten in, and while I do not pretend to say that that was the cause of this outbreak, it strikes me that it was presumably the cause, while I don't know particularly; but as long as it was satisfactorily established that it was the water that caused it, I didn't proceed to scrape the country with a fine-tooth comb to see that all other possible sources were eliminated.

Q. But you did finally conclude that the waters of Charlevoix at the intake of their waterworks, there—that the water was polluted?

A. Yes sir.

Q. Or infected?

A. Yes, I think there was no doubt about that, and I should have come to that conclulsion if there had been no typhoid epidemic and if there had been no case of typhoid on the boat, knowing the conditions that existed around there.

Q. So that the existence of the single case on board the boat was not anything more than an indication of the fact that it was very possible and perhaps very probable that the water supply of Charlevoix was infected?

4154 A. It was what I considered pretty good evidence, or highly probable, or rendered it highly probable, that the water supply of Charlevoix was infected; that in fact the dejecta of that patient, independent of other sources of infection which may have existed, caused the infection.

Q. Have you made any estimate of the amount of water which might be contained in the basin of Lake St. Clair at an ordinary stage of the water?

A. No, I have not.

Q. Have you any opinion upon that subject?

A. Not off-hand, nor that I am prepared to give at a moment's notice.

Q. Well, could you give me now a general estimate of the amount of water in that lake at an ordinary stage, considering it a basin with a radius of 12 miles and a possible average depth of seven feet?

A. Of course it is possible to compute the volume of water that would be contained in a basin of a radius of twelve miles, and an average depth of seven feet, but as that does not approximate to the conditions of Lake St. Clair at all—

Q. In what respect does it differ from the conditions of Lake St. Clair?

A. Well, because considered as a basin, I think 24 miles in diameter would be considered nearer—

4155 Q. I said radius.

A. I beg your pardon, I misunderstood it; at least I had diameter in mind. Do you wish me to make the computation?

Q. No, just—

A. It is just simply a mathematical computation, that is all it would be.

Q. Now as much water must come into Lake St. Clair every day from the St. Clair river, as goes out through the Detroit River in order to maintain the stage of water, must it not?

A. Oh, generally speaking, yes. Of course there are a few small tributaries that bring in some additional quantities, but we neglect that in the present case as it is a very small matter.

Q. Well, if that quantity is 15,552,000,000 cubic feet each 24 hours, then there is considerable water flowing into Lake St. Clair and considerable flowing out?

A. Yes sir.

Q. And, while there may not be visibly upon the surface of that lake a current, yet there must be a very considerable activity of the waters of that lake in order to receive and discharge that much water each 24 hours?

A. It depends upon what you would call considerable activity. The lake is by no means stagnant.

Q. Well, there is some way that the water goes into and 4156 gets out of that lake?

A. Yes, and passes through with velocity.

Q. And that passage through of that water with velocity constitutes a current, does it not?

A. Why, I don't know that you would be warranted in saying that it was what would be dignified as a current, because by currents we ordinarily understand streams of water flowing within somewhat narrow bounds. We speak for instance of the current of a river, as distinguished from the water close to its banks, and so there is undoubtedly a motion throughout pretty nearly the whole of the lake in the general direction of its length.

Q. Is the Gulf stream in the Atlantic Ocean a current?

A. I think so.

Q. And all these other currents in these great oceans are currents?

A. They are. They are currents properly speaking, flowing between well defined banks.

Q. Yet on the surface of the ocean, all along the coast of the United States and clear across to England, and past England up to Norway, there is no perceptible current can be seen, is there?

A. There can if you are stationary, and should put in a float.

4157 Q. Well, did you ever try to put a float into Lake St. Clair?

A. Oh, I have seen things floating about in Lake St. Clair—Yes, I have put in floats, a large number of them; in fact—well, we ran, I think in the neighborhood of two or three thousand floats in Lake St. Clair, or tried to. Some of them ran and some of them did not.

Q. Some of them moved along and some of them didn't. Those that moved along were perhaps carried by some kind of a movement of the water?

A. Yes, those that moved along went down into the outlet where the lake was narrow, and where the lake of course had velocity.

Q. Have you any idea how long it would take a float, the air being calm, to go from the delta of the St. Clair across to the mouth of the Detroit River, on Lake St. Clair?

A. Oh, seven, eight, ten or twelve days.

Q. Did you ever try that experiment?

A. I never sent one clear across the lake, no sir.

Q. Did you ever know anybody who did?

A. No sir.

Q. Do you know whether, if one was put in at some one of the numerous mouths in the delta of the St. Clair, it would go across the lake?

A. I do not. I think it would be very likely to be washed
4158 ashore.

Q. The river St. Clair I presume, has a current?

A. Quite a decided one.

Q. How long in time do you think it would take the current, or take a body of water to flow from the mouth of the river from the head of the river at Detroit, to the Detroit waterworks intake?

A. Oh, a matter of a few hours, one, two or three perhaps.

Q. Two or three hours?

A. It depends upon what you call the head of the Detroit river. It is rather hard to locate Detroit river—it is properly a strait; the lake narrows and the river starts, and there is a current in there of perhaps something less than a mile an hour for some little distance above the waterworks.

Q. You have no definite knowledge then as to the time of the passage of water from St. Clair river through Lake St. Clair to the Detroit River?

A. I think I have quite a definite knowledge.

Q. And how did you acquire it?

A. Based upon the area of the lake, a cross section of the lake through which the water has to flow, and the quantity of water flowing in, and the quantity of water flowing out, and the distribution of the water as it enters the lake, which is such as to insure a quite uniform distribution of the current
4159 throughout the entire lake—the distribution of velocity perhaps I had better say.

Q. Suppose that the St. Clair river should be turned in some other direction and no water from it was supplied to Lake St. Clair, how long would it take the Detroit River to drain that lake?

A. I couldn't say.

Q. Well, what do you think about it?

A. At the present moment I haven't any idea.

Q. Would it take three days?

A. I couldn't say.

Q. Would it take three weeks?

A. I wouldn't want to say at the present moment. I could figure it out for you and give you some sort of a guess at it, but to give you a pure, off-hand statement—

Q. Have you been up the Illinois river at a time of ordinary stage of water?

A. I have not.

Q. At any time or any stage of water?

A. Not in the vicinity of the river, no sir.

Q. Do you know how many dams there are on the Illinois river below Joliet?

A. I believe there are five.

Q. Four government and one state dam?

4160 A. Yes. I don't know whether the Henry dam is called a government dam; it was built by the state.

Q. You never saw those dams in the stage of low water?

A. No, nor any other stage.

Q. Do you want to be understood as stating that the water in the lower pools of any or all of those dams is never more than two-tenths of a foot or a half a foot below the crest of the dam?

A. I never so stated.

Q. I understand that you did so state.

A. I didn't understand that I did so state. If the record shows that I so stated, the stenographers either misunderstood me or I mis-spoke. The statement I intended to make was quite different from that.

Q. (Mr. Johns reading from foregoing testimony of this witness.) "The difference in the height of the water surface measured from the crests of the dams in what would be the upper and lower pools, that is, the water on the upper side of the dams and that on the lower side, is frequently less than half a foot, in fact sometimes as low as two-tenths of a foot."

A. That says "frequently;" it doesn't say all the time.

Q. Is it not true as a matter of fact that the difference between the height of the water on the lower and upper sides of the dam is for more than six months in the year any-

4161 where from two feet to seven, and that but little water flows over the crest of the dam, like a veil, a thin veil of water?

A. That I think is the case.

Q. Well, the dam in such an event would create a very considerable basin above it, would it not?

A. Yes, basins are created by those dams to a considerable extent.

Q. If a given dam on the Illinois river had a perpendicular height of eight feet above the pool below, in extreme low water, it would back the water up the river a considerable distance, would it not?

A. Yes sir.

Q. Are you familiar with the surface flow in various stretches of the Illinois River, for instance, do you know the fall of the Illinois river from Ottawa to Lacon?

A. I am not certain that I have any information on the fall of that particular reach.

Q. Have you any knowledge of the fall of the Illinois river from Morris to Peoria?

A. Yes, approximately.

Q. What is it?

A. Fifty or sixty feet, something of that sort I believe.

Q. Fifty or sixty feet?

A. Wait a minute. (Witness refers to memoranda.) Yes, somewhere around those figures.

4162 Q. Have you any knowledge of the fall of the river from Peoria to Copperas Creek dam?

A. Yes.

Q. What is it?

A. Why, between two and four feet, I guess.

Q. And what is that distance?

A. Somewhere around thirty miles.

Q. Is that a large or a small grade?

A. That is low, very.

Q. A very low grade?

A. Yes sir.

Q. That entire reach of river would be almost a sedimentation tank, would it not?

A. At certain stages.

Q. At a stage of the river when the distance from the crest of Copperas Creek dam to the surface of the pool below, is six feet, the effect of Copperas Creek dam would be to retard the flow of water above Peoria, would it not?

A. Yes, I should say it would.

Q. Does the slope of the Illinois River water change in degree from low to high water?

A. It probably does to some extent.

Q. If for instance the gauge at Henry at the dam read 6 feet, and the gauge at Copperas Creek read 6 feet, and at
4163 some other time the gauge at Henry read 18 feet and the
gauge at Copperas Creek read 18 feet, would there be a difference in the slope of the river?

A. My answer is "No." That is of course confining it to the length between those points, which I judge is what you meant.

Q. Yes. If the height from the crest of the dam at Copperas Creek for instance, to the pool below, at a time when the water ran over the crest of the Copperas Creek dam, in a very shallow stream, say six feet, Copperas Creek dam would be something more than a submereged weir, would it not?

A. Certainly. I wouldn't call it a submerged weir unless the water in the lower pool was above the crest of the dam.

Q. So that the fact when the water flows over Copperas Creek dam, and there is a perceptible flow from the pool above to the pool below, the dam ceases to be a submerged weir?

A. No sir, that statement is not correct.

Q. Well, at what distance would the dam cease to be a submerged weir when there was a perceptible flow in that water over the crest of the dam to the pool below?

A. Well, the dam becomes a submerged weir when the surface of the water in the lower pool rises above the crest of the dam, independent of where the water in the upper pool may be, generally speaking.

Q. When the water at the crest of any given dam on the
4164 Illinois River, flows over the dam from the crest, a distance of two feet to the surface of the pool below, is that dam then a submerged weir?

A. Well, let me be perfectly clear in what you mean. I would like to explain this to you without having it go into the record.

Q. (Question read.)

A. The dam would not be a submerged weir so long as the water in the lower pool was not at a higher level than the crest of the dam.

Q. When a dam ceases to be a submerged weir and is actually an effectual instrument in retarding the flow of the water above it, it aids in sedimentation, does it not?

A. Not necessarily, and very frequently not.

Q. Do you think that the resistance of dams to the flow of the water in the bottom of the stream causes a kind of a pressure to be exerted on the waters in the bottom of the stream and forces them up over the dam?

A. Waters go up over the dam from the bottom of the stream and from all parts of it.

Q. Take Copperas Creek dam for instance, if the water is flowing over its crest at a depth of one foot, is that water so flowing over it from the middle and bottom currents of the stream, or is it simply the top layer of the water slipping over? 4165

A. It is taken from the entire depth of the stream, from top to bottom.

Q. And do you say that the resistance of the dam to the lower current of the stream in such a supposed case tends to force up the impurities settled in the bottom and force them over the dam?

A. I say that the disturbance set up by the obstruction by the dam in causing changes of direction in the flow of the currents, stirs up particles on the bottom and tends to carry them over the dam. That is an observed fact.

Q. How far back from the dam would such a state of affairs exist?

A. Oh, on that head it would only extend for a comparatively short distance—a few times the height of the dam perhaps.

Q. Well, if the height of the dam was seven feet, it would extend back perhaps 21 feet?

A. Oh yes, I would be willing to say probably 20 to 30. It might extend back fifty feet. I shouldn't expect it would be very perceptible beyond that.

Q. Now the passage of boats upon rivers has the effect to very considerably disturb the waters of that stream?

A. Yes sir, in any stream.

4166 Q. If there was a continuous disturbance of the waters of the Illinois river for instance, along its entire course, similar to a disturbance caused by the passage of one stern-wheel steamer, it would be very beneficial to the purification of that water, would it not?

A. I fail to see why.

Q. Well, why would it not?

A. I don't see any reason why it would.

Q. If the waters of the stream were in a continual state of agitation, and that agitation being as violent as that created by the passage of a stern-wheel steamer up the Illinois, would that contribute materially to the purification of that stream?

A. I think not. Bacterial examinations for instance of the Niagara river above and below the falls, and down through the rapids, have shown no change in the bacterial contents of the water at all, and I doubt if any stirring up by the boats would accomplish anywhere near the result that the flow over the Niagara Falls, and the stirring up afterwards, would produce.

Q. We have been taught that time is an enormous factor in this matter. If the waters of the Illinois river were continually agitated for thirteen days, or during the passage of a given body of water through it, for thirteen days, would it add to the purification of the water?

4167 A. I am unable to say. My opinion of the value of aeration, which I judge is the point that you are working at—

Q. Yes sir.

A. Is, that it has been greatly overestimated. Such experiments as we have, bearing upon it now, tend to indicate that.

Q. Have you any definite idea derived from your personal experience or your readings, in whatever way, as to the length of time that a typhoid bacillus might live in the sedimentation of the Illinois River?

A. I have not.

Q. Whether it would live fifteen minutes or fifteen days, you don't know?

A. I am quite sure it would live more than fifteen days.

Q. How do you get at that?

A. Oh, by my knowledge of the apparent life of it in similar situations elsewhere.

Q. Have you, or has any other scientist any kind of positive knowledge as to the length of time that any given lot of typhoid bacilli lived in sedimentation. Now I mean, of positive knowledge?

A. You mean actual experimental knowledge?

Q. Yes, anything more than suppositions.

A. I am unable to cite a case of specific experiment, and at the present moment do not recall one.

4168 Q. How do you arrive at the conclusion that for over 300 days in a year the water would flow from Bear Trap Dam to the mouth of the Illinois river, in fifteen days?

A. By an examination of the gaugings of the stream, and the corresponding water stages.

Q. That is to say, if you knew what the gauge of the stream was at Bear Trap Dam and the gauge of the stream at Grafton, was, you could tell by the fluctuations of the gauge as to when a similar stage of the river existed at Grafton as had previously existed at Bear Trap Dam?

A. Let me see; I didn't quite follow the last part of that question. I think I understand it, but I don't wish to mislead you. Will you read the question?

Q. (Question read.)

MR. JEFFRIES: I object to the question because it is ambiguous and it is impossible for the witness to answer.

A. I would like to have you re-word that a little bit, Judge. I think I understand the question, and I think you intend to be entirely fair in asking it, and I want to answer it fairly, and squarely. I have no desire to evade it at all.

Q. How do you arrive at a conclusion that the flow of water from Bear Trap Dam to Grafton, in fifteen days, by an estimation of the gauges?

4169 A. Well, by taking into consideration the gauge heights at various points down the stream, and the discharges which have been measured at those points or at other points under corresponding conditions of gauges; taking all that information into consideration and comparing it with such other information that I may have as to the time that it requires for the passage of water from one point to another under corresponding or similar conditions.

Q. In order to arrive at that determination, you would have to have the stages of the various gauges along the river for one element?

A. Some of them, yes.

Q. The velocity of the current?

A. At some points.

Q. The amount of discharge at some points?

A. It practically simmers down to the question of velocity in a particular case; that is the question of discharge is only involved—

Q. Well, it is involved in the calculation, is it not, of time?

A. No.

Q. Well, what other elements than those named, would you have to consider in order to determine the time of the passage of a given body of water from Bear Trap Dam to Grafton?

A. The time that it actually took under some condi-
4170 tion of gauges and velocity for water to pass from point
to point along the stream.

Q. But if you did not know the time which it actually took and were endeavoring to find out what the time actually was by some kind of a scientific calculation, what other elements than I have named, would you have to consider?

A. I should then have to consider the discharge and the cross-section of the stream.

Q. At various points?

A. At various points, which would be a wise thing to do in any case.

Q. Would you consider the influence upon this time, of the tributaries of the Illinois river, and their inflow?

A. Most certainly.

Q. You certainly would consider the stage of the water?

A. Yes sir, the condition of the tributaries, would, however, be very largely indicated by the stage of water on the different gauges at different points.

Q. Is there any mathematical formula or any stated rule among engineers by which this calculation is made?

A. Oh, engineers have different methods of making such calculations. I have found, however, that a formula is about the last thing that a man wants to tie up to when dealing with natural laws.

4171 Q. If you knew the gauges of the rivers at various points, the velocity of discharge, and knew also the fact that some floats had gone down from the Bear Trap Dam to Grafton in about ten days, would you take all those things into consideration in arriving at the conclusion as to the time a given body of water would take to go from the Bear Trap Dam to Grafton?

A. I should certainly, and any other information that might bear on the physics of the river.

Q. Of such data you have no personal knowledge?

A. I have made no personal observations of those phenomena in this particular case.

Q. In making your estimate you have resorted to such information as has been afforded you here in the way of publications and the evidence in this case?

A. Yes sir.

Q. And assumed the information in the publications to be correct?

A. Yes sir, which I think was a justifiable assumption considering the sources of the information.

Q. If the water in the Illinois river at a given period stood at eighteen feet upon the gauge, which is considered quite high water, and at another given period had stood at two feet upon the gauge throughout the entire river, what difference in time would there be in the flow of the water from
4172 the Bear Trap Dam to Grafton?

MR. JEFFRIES: Now do you mean all the gauges at two feet and all the gauges at 18 feet?

JUDGE JOHNS: Yes, a uniform stage of the river, high and low water.

MR. JEFFRIES: Well, 18 feet might be high water at some place and might be low water at some other place. It seems to me that question is an impossible one and ambiguous.

JUDGE JOHNS: Well, put it in the record.

MR. JEFFRIES: I object to the question because it is ambiguous and impossible to answer, for the reason that the Illinois river is so situated that an 18 foot gauging might at a certain place be low water, and at other places be high water, and that two feet at certain places might be high water, and at other places low water, so that there can be no comparison made from the question.

A. Understanding by the 18-foot stage, that the river would be eighteen feet above ordinary low water mark, or standard low water mark, if such gauges were along the river as under those conditions, would indicate properly that rise, which of course would not apply to the gauges at the lower side of the dams; for instance, if it should be 18 feet on the upper side of
the dams it would be much more than that on the lower
4173 side, and understanding that your two foot gauge would
represent what river men explain as the river stage—
that's what you mean by the question, is it?

Q. Yes.

A. I would say for the two feet stage of the river the time would be something over twice as long for the water traveling that distance, or from about twice to about three times.

Q. Assuming an ordinary stage of water in the Illinois river, an average stage of water in the Illinois River, and assuming a stage throughout the entire river of 18 feet above the ordinary, which would be extremely high water in the Illinois river, what would be the difference in time of the flow of the water from Bear Trap Dam to Grafton?

MR. JEFFRIES: I object to the question because there are three assumptions included in it, average stage, 18-foot stage and high water stage, having reference to the same condition of affairs.

JUDGE JOHNS: Assuming an ordinary stage, that is to say an average stage?

MR. JEFFRIES: I object to the question for the further reasons that the conditions of the Illinois river are such that it never goes at certain places to 18 feet above high water mark, therefore it is not a practical question as far as the merits of this case are concerned, and as far as any answer that the witness might give would be applicable to the case.

A. Well, if I understand your question, you wish to in-
4174 quire what I would consider the difference in time?

Q. I simply changed the question to assume two different stages, the high water stage and the average stage.

A. That is, you mean the question to cover the high water stage and the average stage?

MR. JEFFRIES: As represented by the figures you gave,—eighteen feet?

JUDGE JOHNS: Yes.

A. At the average stage it would take the water a little less than twice as long, something less than twice as long, to travel over the distance as it would in the case of the flood.

Q. So that if floats were run over the Bear Trap Dam to Grafton in the Illinois river at a stage of high water in ten days and a half, at a stage of low water, they might take twenty days in traveling the same distance?

A. The question was based on mean water?

Q. In the stage of mean water?

A. No, I shouldn't expect that it would take quite as long as that in the swifter parts of the current; I should say possibly sixteen or seventeen or eighteen days.

Q. Would an addition of six or seven days in the flow of a stream like the Illinois be a considerable time factor in its purification?

4175 A. I think it would, yes sir.

Q. A chemical analysis doesn't determine the presence of bacteria in water, does it?

A. No sir.

Q. The chemical constituents of water, such as free ammonia, albuminoid ammonia, nitrogen in nitrites and nitrates, and chlorine, detected by chemical analyses may possibly determine the question of the pollution of that water?

A. I shouldn't want to say that it would determine it. It might.

Q. If these elements were so high that a chemist might come to the conclusion that the water was polluted, he couldn't tell whether the water was infected or not, could he?

A. Not by his chemical analyses.

Q. A bacteriological examination never has determined whether water was infected, has it?

A. There are cases on record where it has.

Q. Where?

A. There are some reported in the "Report of the Sanitary Investigation of the Illinois River and its Tributaries, prior to and after the opening of the Drainage Canal," which was published at Springfield, Illinois, by Phillips Brothers, State Printers, in 1901, on page 93, paragraph 18. "Tetanus bacilli were found at Morris, Henry, and Spoon River, Havana. Anthrax bacilli were found twice at Havana, Illinois River. Of the pathogenic bacteria the bac. coli communis was found 4176 55 times, bac. lactis aeorogenes 16 times, bac. enteritidis 10 times, proteus vulgaris 40 times; proteus mirabilis 3 times; bac. pyocyaneus 2 times; bac. tenani 3 times, staphyloccus pyogenes aureaus 3 times, bac. anthracis 2 times. Respectfully submitted, F. Robert Zeit; Gustav Futterer."

Q. Of how many samples of water, do you know?

A. I do not.

Q. Bacteriological examinations have never detected the presence of typhoid germs in running water, have they?

A. There are cases on record where the typhoid germ has been reported to have been found in running water.

Q. In this country?

A. Yes sir.

Q. Where?

A. In the experimental station of the Massachusetts State Board of Health, at Lawrence, Massachusetts.

Q. In the runnig water of streams?

A. In the tap water as supplied from the running water.

Q. Are you quite sure of that?

A. That statement is on record.

Q. In the report of the Massachusetts State Board of Health?

A. Yes sir.

Q. Does a bacteriological examination as a rule determine whether water is infected?

4177 A. Not absolutely; in fact generally not.

Q. Sanitary Engineers and experts upon the quality of water assume that if there are populous communities having their sewage and drainage thrown into running streams, that the streams are infected?

A. That is an ordinary assumption and a very justifiable one.

Q. Do you consider in looking into the future, that the Missouri river, in its watershed, will never be densely populated?

A. It depends a little bit upon what you mean by densely populated. Oh, certainly I anticipate a very marked increase in population in the Missouri River valley and its tributaries.

Q. As well as the valley of the Mississippi river?

A. Yes sir.

Q. And the valley of the Illinois?

A. Yes sir, and I might add that there is a probability of greater growth on the Mississippi and the Missouri, than there is in the valley of the Illinois exclusive of the upper end,—Chicago.

Q. So that the amount of sewage pollution in each of these rivers, the Mississippi and the Missouri is likely to increase much in the future?

A. I think so.

Q. And the Missouri is therefore in the future a menace

4178 to St. Louis?

A. I don't know that the river is.

Q. The waters of the river?

A. It would depend upon what is done with them.

Q. In their natural state, considering the future, the untreated waters of the Missouri river will be necessarily a menace to the inhabitants of St. Louis as the waters came into the intake, would they not?

MR. JEFFRIES: I object to the question because in their natural state they could not under any possibility be a menace to the city of St. Louis.

A. I shouldn't think that the waters of the Missouri river in their natural state, either in the present, past or future, would be a menace, but if you mean with the growth of population upon the Missouri watershed it would contribute additional infection to the Missouri river and cause it to become less healthful and less safe as a water supply, I am perfectly frank to answer yes.

Q. And that answer would apply also to the waters of the Mississippi river?

A. Yes sir.

Q. Could you expect that in the distant future in a stage of very low water, that the waters of the Missouri river would become substantially a stream of liquefied sewage, or a stream of liquid sewage? 4179

A. I can hardly conceive that in the Missouri river.

Q. Could you conceive that as to the Mississippi?

A. A little more readily.

Q. Depending entirely upon the supposed and anticipated increase of the sewage, in the pollution of each of those streams?

A. No, not entirely upon that.

Q. Upon what other considerations?

A. Upon the decrease of the flow of the streams themselves for one.

Q. Well, from the decrease of the flow and the increase in the population, the waters of both of these rivers would be dangerous to the inhabitants of the State of Missouri, on her banks?

A. For ordinary domestic purposes, you mean?

Q. Yes.

A. Yes.

Q. Are there other persons, sanitary engineers, expert in water supplies in this country, who are as familiar with the subject as yourself?

A. I think there are not very many.

Q. About how many?

MR. JEFFRIES: I object to the question as being incompetent, irrelevant and immaterial. 4180

A. At the present moment I do not think of any whose judgment I would take in preference to my own, or whose judgment I would advise a client to take in preference to my own.

Q. If it could be imagined that some gentleman who had the experience and qualifications equal to your own, and had made the same amount of examination and study of the conditions embraced in this entire case, should come to an opposite conclusion to yours, would you consider that that person exhibited an ignorance of the conditions and of the subject which would make his opinion of no account?

A. That would be the conclusion I would have to draw from the evidence in the case.

Q. Assuming a certain number of cases of typhoid fever at St. Charles, Missouri, and an equal number of cases at Kansas City, Missouri and consequent typhoid fever in St. Louis, to which place would you attribute the typhoid fever in St. Louis, St. Charles or Kansas City?

A. Both.

Q. Assuming typhoid fever in St. Charles, Missouri and an equal number of cases at Omaha, and typhoid fever in St. Louis, to which would you attribute the typhoid in St. Louis?

A. Well I would say, to be perfectly fair to both yourself and to me, that in answering the former question I assumed you to mean that the typhoid occurred in St. Louis at a 4181 proper time after the appearance of the other to permit of the connection.

Q. Yes sir.

A. Yes sir, I should attribute it to both.

MR. JEFFRIES: And also that there is typhoid fever at no other place, just those two places?

JUDGE JOHNS: I am assuming these conditions.

MR. JEFFRIES: Eliminating all other conditions?

JUDGE JOHNS: Assuming typhoid fever at St. Charles, Missouri, and an equal number of cases at some place near the head waters of the Missouri river—

A. Helena, Montana for instance?

Q. At some place near the head waters of the Missouri river, Helena, Montana, for instance, and that the waters from Helena came down infected and joined the waters of the Mississippi, with the same infection, and the two bodies of water thus infected, arrived at the St. Louis intake, to which one would you attribute the consequent typhoid fever in St. Louis, Helena or St. Charles?

A. On the hypothesis stated I should attribute it to both.

Q. Take out of the hypothesis that the waters coming from Helena were infected, but assume the dejecta of typhoid patients in Helena, cast into the Missouri River, and that body of water into which it was cast, coming down to St. Charles, and there joined by water infected with an equal number of cases
4182 of typhoid fever in St. Charles, and typhoid fever in St. Louis consequent, to which place would you attribute the typhoid fever in St. Louis?

A. I would still be inclined to think that both might be responsible for it.

Q. Considering 50 cases of typhoid fever at Helena, Montana, and no other possible source in the Missouri River of infection of its waters, from typhoid at that time, and that the waters from Helena, Montana arrived in the Mississippi river at the Chain of Rocks, and that in a proper time after that there occurred in St. Louis an increase in typhoid fever, would you attribute that to the infection of the river at Helena?

MR. JEFFRIES: Object to that question on the ground that it does not eliminate the local conditions; that is the conditions up the Mississippi or the Illinois.

A. On the hypothesis stated, I should not want to attribute a very large part or more than a very small part of the increase of typhoid fever in St. Louis to the typhoid fever cases at Helena.

Q. Can you conceive of any distance in a running stream in which typhoid fever bacilli might not live in the waters of that stream?

A. The life of the typhoid bacilli in streams, is rather a question of time and distance, and as a general proposition
4183 I would say that it is my present opinion that there is no stream of water on the surface of the earth flowing in natural channels, that is long enough to warrant the absolute assurance that a typhoid germ might not live from one end of it to the other.

Q. So if there were typhoid germs cast into the waters of the

Mississippi river at St. Paul and no other possible source of infection of those waters, do you believe that those typhoid germs might arrive at New Orleans and infect the water supply of the city of New Orleans?

A. I think it is possible to a certain degree; that is, I think it is possible that some of them might arrive. I do not want to be understood as saying they would all arrive.

Q. Are not all of such suppositions very vast extensions of any kind of knowledge upon that subject?

A. I think not.

Q. Do you know, in your experience or learning, of any instance in which even by the process of reasoning of scientists in water supply, or bacteriology, or chemistry, or of sanitary engineering, where they have determined to their own satisfaction that the typhoid bacillus has lived in running streams for a distance of over 150 miles?

A. Yes sir.

Q. What instance?

4184 A. The instance of the pollution of the St. Louis supply by the drainage of the city of Chicago for one.

Q. Any other?

A. The pollution of some of the supplies on the Merrimac River, I believe are traced to distances as great as that. The pollution of the Connecticut river similarly, and on the Hudson river.

Q. Infectious?

A. Yes, infections.

Q. Name an instance in which an infection has been traced in the Merrimac River a distance of 150 miles.

A. The typhoid along the lower river towns on the Merrimac river has been shown to follow in regular sequence the typhoid in the upper river towns for a number of years consecutively, indicating that pollution travels down the river from town to town and through practically the whole length of the stream.

Q. Is there any instance with reference to the Merrimac River in which the infection of a town 150 miles from another town, on the course of that stream, has been traced to the upper town?

A. I think that you may fairly say that that is the case.

Q. Now what other instance?

A. As I say, there are similar instances in connection with
4185 the Hudson river, that I have in mind at the present moment.

Q. Have you in mind an instance in which it has been assumed or stated by sanitary engineers, that the infection of water in the Hudson river at a given point was caused by a similar infection of the water of the Hudson river 150 miles above?

A. I am not prepared to make a specific statement of that kind; that is a specific citation of the instance, but a statement was made to me not very long ago, that such was the case, by a gentleman who had made some investigations along those lines.

Q. Some recorded instance?

A. Yes I believe so.

Q. What one?

A. I think it was in the case of the sewage from Schenactady and some of the lower Hudson river towns.

Q. Can you state the lower towns?

A. No, I cannot at the present moment, because I didn't inquire into the thing particularly; it came up in a casual conversation.

Q. Did the gentleman who gave you the information make any publication of the investigations?

A. I believe not. I think he is in the employ of the State of New York, making the investigations, at present, and
4186 probably will publish it within the present year.

Q. Did you ever hear of an instance where the pollution of one water supply, or infection, was caused by the infection of a water three hundred miles above?

A. Yes sir.

Q. In what instance?

A. In the case of Chicago and St. Louis that we are considering at the present time.

Q. Any other?

A. Your question was 300 miles?

Q. Yes.

A. I will say no to that question.

Q. Did you ever hear of or know of an instance in which the infection of a water supply was attributed to an infection 250 miles above the place where the infection was found to exist except in the case now under investigation, and if so where and how did you hear of it?

A. I do not recall of having heard of any such case at the present moment; that is, any such specific case.

Q. Did you ever learn of a case in which the infection of a water supply at a given point was attributed to similar infection 200 miles above the infected place except the one under investigation at present?

A. I think, generally speaking, that I have.

4187 Q. In what instance, and what place?

A. Cincinnati and Pittsburg, which it turns out are considerably further apart than that.

Q. How far is Cincinnati from Pittsburg?

A. Somewhere around 300 miles I believe.

Q. Has it been asserted by sanitary engineers or any kind of scientific men that the waters of Pittsburg infect the waters at the intake at Cincinnati?

A. I think I have seen such a statement, on what would be considered the authority of some kind of a scientific man, or some kind of scientific men.

Q. Who was the man and what kind of a scientific school did he belong to, what profession?

A. My impression is that it was the Board of Sanitary Engineers who were considering the water supply of Cincinnati. I think so, but as I am speaking from memory on that, I won't be positive about it.

CROSS-EXAMINATION,

By Mr. Todd.

Q. Professor, will you state in detail how you estimated the rate of flow for 300 days in the Illinois river and the methods that you employed?

A. By an examination of the gauge heights at various 4188 points along down the river, to ascertain what the river stages were for certain periods in the year, and comparing those gauge heights with the discharges at various places and the corresponding velocities at those places, and making use of all the information that I was able to gather on the subject.

Q. Any other elements that you took ino consideration?

A. The profile of the river, the cross-section and the data that I could gather at the present time, about the river. I do not pretend to say that my examination has been exhaustive, and may not be subject to some revision, but according to the best information that I possess now, those results that I gave are correct, I think.

Q. Where did you get the information from?

A. I got the information from the reports of the United States Engineering Corps, the records of the gauge heights along the river as published by them, from the various surveys of which I have the maps and profiles, and the maps of the geological survey and some reports of the Chicago Drainage Canal and various other things. I took into consideration everything I could get hold of on the subject in the limited time that was at my disposal.

Q. After you got that information, what mathematical formula did you apply to it?

A. None whatever. I do not tie up to mathematical formulae; I have been experimenting in hydraulics too long to make any such break as that. 4189

Q. Well, you applied mathematics to the information?

A. Of course you have to apply mathematics to it.

Q. What rules in mathematics?

A. Well, the simple rules of addition, multiplication, division and substraction.

Q. What I wanted to get at were the facts upon which you base your calculation that would enable a civil engineer or a water engineer to verify it.

A. I think they would, yes sir.

Q. If possible?

A. Yes sir.

Q. And from what you have given me, and the sources from whence the information was derived, that could be done?

A. Yes sir. Of course I may say that in such a case you may expect a personal equation in the conclusions that a man would arrive at.

Q. In figuring the time at Detroit, from the time that the infected matter dredged from the Black river was deposited into the St. Clair river, and from the time there were in a single day in Detroit four deaths from typhoid fever, there having been only one in the preceding 24 days, as contained in
4190 the answer that you gave in your direct examination
for the time required for the infection to come from the point at Port Huron in the St. Clair river, to the consumers of water in the city of Detroit; the date of those four deaths was the time that you calculated back from in arriving at the time it took the infection to reach Detroit, was it?

A. No sir.

Q. What part did the four deaths in Detroit have upon the estimate?

A. They had no part at all in that. I started at the other end of the problem entirely.

Q. You started with the date of the infectious material being deposited?

A. Yes sir.

Q. And calculated up to the four deaths?

A. Yes sir.

Q. And that the period from the deposit of infectious material to the four deaths occurring corresponded within 24 hours you stated, of the time allowance for incubation?

A. For the transmission, incubation and death.

Q. How long had those patients been sick with typhoid fever?

A. I couldn't say.

Q. How long after a person contracts typhoid fever before
4191 they pass the danger point?

A. That's rather hard to say.

Q. A person may have typhoid fever and it may run over two months?

A. Oh yes.

Q. And at the end of the two months die?

A. Yes, may die at the end of six months.

Q. And may die before the end of three or four days after contracting it?

A. No sir, I think there are no cases on record of a man dying of typhoid fever as quickly as that; at least none has come to my attention.

Q. You wouldn't say that it was not possible?

A. I wouldn't say that it was not possible, but it is highly improbable.

Q. Well, not knowing how long these four patients had been down with typhoid fever before they died, how did you make your conclusions as to the time of incubation, between the deposit and their death, as being an accurate judgment?

A. Well, having made a study of the statistics of some thousands of typhoid cases, and determining therefrom the ordinary average period elapsing from the time of infection to the time of death; or from the time of taking down to the time of death, and finding the average period in a very large number of cases of typhoid, I felt warranted in assuming
4192 and applying that period to the cases in question.

Q. Regardless of knowing whether those patients had been sick for two or three months prior to death or not?

A. Certainly, yes.

Q. Assuming, if as a matter of fact they had been sick for two or three months before death, would your knowledge gained from other statistical investigations affect your judgment in applying it to the cases under consideration? By that I mean that your conclusion was based upon a general principle as I understand it, deduced from your investigations of typhoid fever other than the four deaths in question?

A. Yes, it was to a large extent. I consider that the four deaths were highly corroborative of the conclusion I arrived at from another course of reasoning.

Q. Assuming it is not an improbability or an impossibility—

A. It certainly is not an impossibility.

Q. That the date of the four deaths under consideration had occurred after an illness of say two or three months duration, would that make any difference in your conclusions?

A. I think I can safely eliminate those four deaths, without vitiating my conclusions or causing me to change my views in the matter.

Q. In your studies as a Sanitary Engineer and an epidemiologist, have you added anything new and unknown to the science of epidemiology, and to that of sanitary engineer-
4193 ing and water supply?

MR. JEFFRIES: I object to the question because there can be nothing new added to a science.

A. I have certainly extended the amount of information available to persons engaged in those subjects.

Q. Have you enunciated and demostrated any new principles?

A. I don't know that I have.

Q. Have you been the pioneer in any new departure of investigation in these sciences?

A. I should hardly want to claim that I have.

Q. Has this science of epidemiology and sanitary engineering as to water supply been exhausted?

A. I rather think not.

Q. Do you know of anyone in this country or elsewhere that has made more extensive investigations than yourself?

GENERAL CROW: You mean into those two general subjects?

MR. TODD: I am talking about these two subjects.

A. Sanitary engineering and epidemiology?

Q. Yes?

A. Oh, yes I think so. I think there are such persons.

Q. If such a person, in consideration of these facts should draw different conclusions from those which you have drawn would you consider their conclusions unworthy of ac-
4194 ceptation?

A. Unless they were possessed of other facts which are not now known to me, I would certainly consider they had made a mistake.

Q. Do you consider that in your investigation of the conditions existing between Chicago and St. Louis, on the watershed of the Mississippi river above the intake, that you are in possession of all the facts possible and necessary in this investigation, and sufficient to establish the certainty of your conclusions?

A. Yes sir.

Q. Then if the one who has made greater investigations, and had broader experience in these sciences than you have, and I believe you concede there are some who have done it, and should be acquainted with all the facts with which you have been acquainted, should draw different conclusions would you consider these conclusions were unwarranted and unworthy of acceptation?

A. Unless he had different information to that which I had I would so consider it.

Q. Can you conceive of any different information that could be obtained that would change your conclusions?

GENERAL CROW: Do you mean different information in the development of the science, or local conditions?

MR. TODD: I mean in the development of the science or
4195 local conditions.

A. No, I cannot.

Q. Do you consider your conclusions in this case then as infallible?

A. No sir.

ADJOURNED until 2:00 P. M., same day.

Southern Hotel, St. Louis, Missouri.
4196 2:00 P. M., Thursday, May 28th, 1903.
Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

GARDNER STEWART WILLIAMS,

resumed the stand for further cross-examination by Mr. Todd and testified as follows:

Q. Professor, have you studied the typhoid conditions existing on the watershed of the Mississippi, the Illinois and Missouri rivers for the years 1896, 1897, 1898 and 1899?

A. To a considerable extent, yes.

Q. If, during those years there existed upon the watersheds typhoid fever that resulted in the death of from 300 to 375 people annually, from all the towns and cities situated upon the river, emptying their sewage into the Illinois, Mississippi and Missouri rivers, would the excreta from that number of typhoid patients be sufficient in your judgment to render the water supply of St. Louis unsafe and dangerous for domestic use?

A. The presence of such cases would undoubtedly render
4197 the water supply of S. Louis unsafe and dangerous for
domestic use, for even though the water was treated by what we know to be and what analysis has shown was an efficient method of treatment, the typhoid fever death rate and number of cases of death in St. Louis apparently traced to water infection is greater than should exist attributable to a good water supply.

Q. With your experience as a sanitarian or sanitary engineer and epidemiologist, if during those years you should have occupied the position of sanitary engineer of the water supply of St. Louis, and the same system of water supply existed, then in the city of St. Louis, as exists today, and you were in possession of the history of typhoid along the valley of the Illinois river and the Mississippi river and the Missouri river, and their tributaries, would you as a sanitarian and epidemiologist, recommend the water that was suppiled to the citizens of St. Louis as a safe and drinkable water?

A. I should certainly not have recommended it as a safe water.

Q. Would you have recommended it as a drinkable water?

A. I shouldn't have advised the people to drink it without further treatment.

Q. What treatment?

A. Why, boiling, filtration, or some treatment that would
be sure of certainly reducing the possibility of infection
4198 from it.

Q. Would the treatment that you recommend then, such as boiling, be a safe treatment to use now?

A. It certainly would add very much to the safety of the water if the water were boiled now. I would consider it would be a safe water.

Q. Is there any way known to sanitary science or epidemiology which can tell or demonstrate that the increased typhoid in St. Louis in 1900, 1901 and 1902, did not come from any one of the cities whose sewage emptied into the Mississippi river above the intake on the Mississippi?

MR. JEFFRIES: That is excluding Illinois?

MR. TODD: No, including everything.

A. There is no method that I am aware of that would enable one to demonstrate that no part of the infection came from any one of the cities in question.

Q. Is there any way to show that all of it did not come from any one of the cities tributary to the waters of the intake?

GENERAL CROW: You mean the increase or the typhoid?

Q. MR. TODD: All the typhoid.

A. I think it would be entirely possible to show that.

Q. Outside of making assumptions that are not scientifically established?

A. Yes, I think so. That might be scientifically established.
4199 I am not prepared to say that the necessary evidence can be adduced at the present moment, that it is in shape to produce.

Q. What do you mean by that last expression, Professor?

A. I mean just simply this, that I think it would be entirely possible to prove infections in the cases of some of these instances which came from such specific sources, as to prevent and preclude the possibility of all of the cases having come from any one source.

Q. I mean from the cases that are produced by water-borne diseases?

A. By water-borne infection?

Q. That's what I mean.

A. Well, I wasn't restricting it to water-borne infection in answering the question.

Q. In my question, I confined myself to the typhoids in St. Louis that came from the drinking water, from the water supply of St. Louis; not isolated cases that have been contracted by families or individuals in some other town or some other locality than St. Louis, which is easy to demonstrate.

4200 Q. (Previous question read)—which have been contracted from the drinking water of St. Louis?

A. I think that can be shown with an accuracy sufficient to meet the requirements of science.

Q. I don't know what the requirements of science are because that is a variable, mercurial term from my standpoint; but can that fact be demonstrated as a logical proposition?

A. I think it certainly can, as a logical proposition.

Q. If in the year 1896 there were 60 deaths in Minneapolis, 1897, 148 deaths; 1898, 86 deaths; 1899, 71 deaths, and Minneapolis is 707 miles from St. Louis, and in Kansas City, which is only 403 miles, for 1896 there were 29 deaths; 1897, 38 deaths; 1898, 49 deaths, 1899, 52 deaths, and assuming that there were no other cases of typhoid fever reported on the water-shed tributary to the water supply of St. Louis, understanding by that the Illinois, Mississippi and Missouri Rivers—

A. Let me suggest right there, do you mean reported or existing?

Q. Reported or existing.

A. All right.

Q. And there was in St. Louis for those years, 106 deaths for 1896; 125 for 1897; 95 for 1898 and 130 for 1899, and that the typhoid condition was assumed to be attributable to the water supply of the city; is there any way known to the science that has to do with water supply, whether it is termed
4201 sanitarian or epidemiologist, that can demonstrate whether this contagion came from Minneapolis in its entirety, or whether it came from Kansas City in its entirety, or whether it is a combination of both, assuming that the times of the typhoids in St. Louis and in these other two places are not in conflict with the theory of typhoid?

A. As borne from those places?

Q. Yes.

GENERAL CROW: What other place did you name besides Minneapolis?

MR. TODD: Kansas City and St. Louis. I eliminated the others in the hypothetical question.

A. There is no means by which it would be possible to determine how much came from either one or that it did not come from both.

Q. Is there any way to show that it did not all come from one or the other?

A. I think that might be fairly shown.

Q. In what way, except by assumptions?

A. By the actual history of the water, and the conditions of stream flow, and so on, and the statistics of the outbreaks themselves,—all three considered.

Q. Assuming that there was no existent history that would exclude either one or the other of these places, as being
4202 the cause of the typhoid in St. Louis?

A. I judge from this question that you misunderstood my answer to the last, or else I misunderstood your question in answering it. The answer that I intended to give to the last was that I thought it was possible to establish the fact that it came from both sources; not that it came from either one.

Q. Is it possible to establish the fact that it came from either one of the sources?

A. No sir, I think not, under the conditions assumed.

Q. It might be possible that it should come from one source and not from the other, might it not?

A. I should regard it as very doubtful that that would be the case under actual conditions.

GENERAL CROW: Under assumed conditions.

A. I mean under assumed conditions, yes.

Q. MR. TODD: I mean under assumed conditions.

A. Well, along with those conditions one is necessarily compelled to assume the laws of nature to be in force and acting, and so on. We cannot consider a susupension of them in answering a question of that kind, and I intend to confine myself strictly to your assumptions so far as they cover the case.

Q. If conditions existing between Minneapolis and St. Louis were such as to be the cause of the typhoid in St. Louis, and similar conditions existing between Kansas City and
4203 St. Louis were such as to have Kansas City the cause, and these two conditions existing in Minneapolis and Kansas City existed at the same time, is there any way known to science of waters than can demonstrate whether the cause of the typhoid fever in St. Louis came from Kansas City, and not from Minneapolis, or from Minneapolis and not from Kansas City?

A. Not to my knowledge. That was the answer that I intended to give to the question before.

Q. Notwithstanding the fact that conditions of that kind might exist as to those two places, isn't it possible that the contagion could come exclusively from Kansas City, or from Minneapolis, without receiving any effect of contamination from the other city, whichever the case may be?

A. I should think not.

Q. But there is no way of proving the affirmative or the negative of the proposition, is there?

A. I think it would be impossible to make an absolute proof either in the affirmative or the negative.

Q. Now, if added to those conditions in the hypothetical questions where the two cities were supposed, all the conditions which actually exist along the watershed of the Mississippi river above the intake, is it possible then to say which one of
those cities contributed the largest amount of the typhoid
4204 existing in St. Louis for the years 1900, 1901 and 1902?

GENERAL CROW: You mean the Mississippi or the Mississippi and tributaries?

Q. MR. TODD: When I use the term waters of the Mississippi at the intake, I include the tributaries, the Illinois, the Mississippi and the Missouri.

A. You are basing the thing now on the conditions as they actually exist?

Q. As they actually exist?

A. I think not.

Q. Is there any way of scientifically demonstrating the proportionate share of the increase in typhoid fever in St. Louis, from any of those cities, without assuming something?

A. It seems to me that it may be demonstrated without an assumption.

Q. What proportion did Minneapolis contribute to the increased typhoid fever in St. Louis in 1900?

A. I couldn't say.

Q. Can you say what proportion any of the cities contributed outside of Chicago?

A. I doubt it, I think not.

Q. Can you show what Chicago contributed without assuming anything?

A. Not the absolute quantity.

Q. Any more than you could for Minneapolis?

4205 A. I think so.

Q. Any more than you could for Kansas City?

A. Any more than for Kansas City—I think so.

Q. Any more than you can for any one of the number of cities the typhoid statistics of which have been introduced in evidence here?

A. I think so.

Q. Is there a different rule applied by epidemiologists and sanitarians to the city of Chicago than would be applied to all or any of the other cities lying tributary to the water supply of St. Louis?

A. There is not; but different facts are in our possession in regard to the city of Chicago from those which exist in regard to the other cities on the watershed.

Q. If different facts are in your possession in regard to the city of Chicago, from what you have in regard to Kansas City, Minneapolis and these other cities, how are you able to draw a conclusion in regard to the typhoid conditions existing in these other cities, such as you have done in your testimony?

A. I don't see any difficulty in doing that. If a man has different facts in regard to two different things, he certainly would draw two different conclusions in regard to them.

Q. Do you regard that you have the facts as elaborately in regard to all of the other cities as you have in regard

4206 to Chicago?

A. Not quite, but sufficiently so for all practical purposes I think.

Q. What do you mean by practical purposes?

A. Those purposes for which a practical man would use such facts.

Q. Is a sanitarian and an epidemiologist a practical man?

A. I should hope so.

Q. Is that word "practical" man, and scientist, synonimous?

A. Not necessarily.

Q. As applied to water?

A. Not necessarily.

Q. What facts have you about Chicago that you have not about Peoria?

A. The fact that at a certain time its sewage was added to the waters which supplied St. Louis with its water supply, for one thing.

Q. At that time was the sewage of Peoria being added to the water supply of St. Louis?

A. Yes sir, I think so.

GENERAL CROW: You say, was it being added; it was already coming into it.

THE WITNESS: I understood Mr. Todd to be asking a fair question.

4207 MR. TODD: I am not trying to play on this at all.

GENERAL CROW: I know you were not; that is the reason I suggested it.

THE WITNESS: I understand Mr. Todd to be conducting a straightforward examination here, and I am endeavoring to answer his questions fairly and squarely.

Q. MR. TODD: Previous to the opening of the drainage canal, what was the difference in the volume of sewage from Chicago entering the Des Plaines River from what empties into the Des Plaines river now, since its opening?

A. I am not prepared at the present moment to give explicit figures.

Q. You have testified as to the number of cubic feet of fecal discharge entering the drainage canal every 24 hours, from the sanitary district, have you not, Professor?

A. I think not.

Q. What was the 4400 cubic feet that you testified about; what did that represent?

A. That represented the solids in the fecal matter discharged into the sewers of Chicago, which are tributary to the Chicago river and the drainage canal.

Q. And which enters the drainage canal?

A. I didn't say that it entered the drainage canal.

Q. Well, do you know whether it does or not?

4208 A. Some of it does undoubtedly.

Q. Do you know what proportion of it does?

A. No.

Q. Do you know whether the same territory that empties into the Chicago River, the 4400 cubic feet of solid fecal matter, is any different today from what that same territory was prior to the opening of the drainage canal?

A. I couldn't say at the present moment positively.

Q. Do you know how much, or what proportion of that 4400 cubic feet was pumped into the Illinois and Michigan canal at the Bridgeport Pumping works prior to January 17th, 1900?

A. No.

Q. Do you know whether all of it was pumped from the Bridgeport Pumping works into the Illinois and Michigan Canal prior to the opening of the drainage canal?

A. I am very sure that it was not.

Q. Do you know?

A. Yes, I think I can say that I know.

Q. How much of it was?

A. I don't know how much of it was.

Q. Do you know whether 80 per cent of it was?

A. I do not.

Q. Do you know that 80 per cent of it was not?

A. I do not.

4209 Do you know whether 90 per cent was?

A. I do not.

Q. Have you any judgment on the matter based upon any accurate knowledge?

A. I don't know that I have at the present moment.

Q. Then in giving an opinion in regard to the contamination of the water supply of St. Louis as being infected by the sewage of Chicago, as to an approximate amount of that infection, and not being able to give the same information in regard to the other cities, don't you as an expert deem it necessary to know those facts in order to be able to make your conclusions in regard to the infection from Chicago proportionately increasing the typhoid in St. Louis?

A. Those facts in regard to the other cities, you mean?

Q. No, in regard to the amount of that solid matter being pumped into the Illinois River and Des Plaines through the Illinois and Michigan Canal via the Bridgeport pumping works, prior to the opening of the canal?

A. I don't see how that influences the case any more than knowing the actual amount of infection that may have come from any other source, that was continuous, before the opening of the drainage canal.

Q. Do you know the amount of infection that came from any other one source before the opening of the drainage canal?

4210 A. Oh no.

Q Since the opening of the drainage canal, you stated that there was a sediment on the bottom of the Chicago river. How much of a sediment is there upon the bottom of the Chicago river at present?

A. I couldn't say.

Q. Have you any idea?

A. Oh, I think it would vary in different places. I wouldn't be surprised if you might find some feet of it in some places.

Q. From the mouth of the Chicago river to Robey Street, where the Canal enters the Chicago river, what sediment such as you have described in the first part of your examination in chief, would you say was on the bottom of the Chicago river?

A. I think that sediment that has been accumulating there for a number of years is still there, and additional sediment that is drawn in from the lake itself, is probably there.

Q. Suppose that there was no such sediment, would that have any effect upon your conclusions?

A. I doubt it.

Q. Do you know of anything in addition existing in Chicago that if it was different from what you assume exists there would have any effect upon your conclusions?

A. Oh yes.

4211 Q. Did you consider the sediment on the bottom of the Chicago river as an important factor in this examination?

A. Not as a continually important factor; I think it was an important factor at the opening of the canal.

Q. Well, as of today?

A. Oh, it has its importance, but it is not paramount.

Q. What importance has it?

A. Why, simply the importance that it is likely from time to time to be disturbed and carried on down into the Illinois river and into the Mississippi, and carry with it infection.

Q. When was it that you were in Chicago and examined the Lake front?

A. That was in 1892.

Q. Do you know whether the Lake front in Chicago today is the same as it was in 1892?

A. I know that it is quite materially different in some respects.

Q. In what way?

A. Oh well, the conditions there have been considerably improved.

Q. When you were in Chicago the Lake Front, so-called, was immediately beyond the tracks of the Illinois Central railroad, was it not?

4212 A. That was the portion with which I was most familiar.

Q. Well, do you understand now that the Lake Front has been extended several thousand feet beyond that point, and they are filling in what is known as Grant Park?

A. No, by the term Lake Front, I referred to the—

Q. I mean from 12th Street to Randolph.

A. In using the term "Lake front" I was not confining it to any specific narrow location. I was speaking of that portion of Chicago which borders upon the lake.

Q. The entire lake front?

A. Yes, substantially that.

Q. And did the conditions which you found and testified to obtain along the entire lake front for the municipality of Chicago?

A. Oh, I can't say that they did along the entire lake front.

Q. Those conditions obtained mostly near the mouth of the Chicago river, did they not?

A. That is the worst portion, nevertheless, along the entire lake front there are more or less accumulations of matter that has apparently come out of the Chicago river, or there are undoubtedly—I won't say that there are positively, because I have not measured any, such accumulations that have been borne there by the effect of waves, and winds, and currents which set back

and forth along the shore, so that an examination of the
4213 bottom of the lake would undoubtedly reveal quite extensive pollution of it for long distances beyond the narrow limits that one would first expect to find that pollution in.

Q. How deep is the Chicago river, if you know?

A. My recollection is that it is somewhere around sixteen or eighteen feet possibly.

Q. If it should appear that the Chicago river from the entrance to Robey Street was of a depth of 26 feet in the channel, with the exception of the tunnels, and that condition has been created within the last three years, would that have any effect upon your conclusions in regard to the effect of sedimentation in the Chicago river?

A. I think not, for that is about the condition that I should have anticipated would have resulted there.

Q. What effect did the sewage pumped into the Illinois and Michigan Canal prior to the opening of the drainage canal, have upon the water supply of St. Louis?

A. I don't know.

Q. How much of the typhoid in St. Louis, would you attribute to the discharge of Chicago sewage through the Illinois and Michigan canal prior to the opening of the Sanitary District?

A. I couldn't say.

Q. Can you now state how much of the increase in ty-
4214 phoid fever in St. Louis is due to the sewage discharged through the drainage canal?

A. I think it is safe to state that the major part of it is.

Q. By major part, what do you mean?

A. Well, considerably more than half.

Q. How many cases of typhoid in St. Louis for 1900, was the excess over 1899?

A. I can't say at the present moment; I can look the matter up and tell you.

Q. If there were 130 deaths in St. Louis in 1899, and 168 deaths in 1900,—if those were the figures?

A. You are speaking of deaths now?

Q. Deaths.

A. All right.

Q. Is there any way of ascertaining the number of cases, and the excess,—increase?

A. Not absolutely.

Q. What would you say approximately?

A. I would say approximately that the cases probably increased to about the same extent, the same proportion as the deaths, as a general proposition.

Q. Suppose that the number of cases as testified to upon the chart that is offered by Dr. Ravold, in 1900, was 1213 cases,
and in 1901 was 1101 cases, and 1902, was 1112 cases,—
4215 which would be the most scientific way to consider the
question of typhoid, increase in deaths, or the decrease
in cases?

A. The increase in deaths.

Q. What?

A. The increase in deaths, certainly.

Q. Why do you say that the deaths are the better criterion than the cases, if you have the deaths and the cases?

A. Because a man never dies but once, and if he dies, under the laws of the United States generally, a record of his death is bound to be made somewhere; whereas, a man may be sick of the typhoid and no record of it appear; so that records of cases are always deficient. As a matter of fact, it is rarely that you get more than 60 per cent of the cases, and the percentage varies considerably from year to year.

Q. But if, as in the case of St. Louis the deaths are reported by the doctors, and the cases were reported by the doctors, you have relied upon the doctors' diagnostication of the cases?

A. I am not questioning the diagnoses in either case; I am questioning the report.

Q. The report?

A. Yes, I say that a man having a case of typhoid might not report it, and in fact it shows that they don't report it, to
a very large extent.

4216 Q. A man frequently has been accused of dying of ty-
phoid when as a matter of fact he didn't have it, hasn't
he?

A. Oh, certainly, and so there have been other cases where he died of other causes and they thought he had typhoid.

Q. So it leaves the whole situation in doubt, doesn't it?

A. To a moderate extent; but considering these things from a broad, practical standpoint, those things will balance up in a period of years; those things might vary considerably in a week's time, but in a year, the record will come out about right.

Q. The only true science then is not the medical but the epidemiological science?

A. I don't know on what grounds you have come to that conclusion.

Q. If the cases reported and testified to as being accurate are not to be relied upon, how are the deaths that are reported and testified to, to be relied upon?

A. Well, the simple reason, as I stated before, that if a man dies, he never dies but once, and some record of that is bound to get—or some statement of that is bound to appear upon the record books; but a man may have typhoid fever and never be treated at all. He wouldn't report the case himself, because he wouldn't know that he had it, and the facts prove that where-
as the mortality from typhoid fever where cases are
4217 looked after and reported, to a large extent, is only about
one in seventeen while taking the ordinary statistics the
ratio is about one to ten; that is ten cases to one death, whereas, properly it is seventeen cases to one death.

Q. If a man has typhoid and does not know it, why should the epidemiologist assume the fact that he has it when there is no evidence?

A. The epidemiologist does not assume the fact that he has it.

Q. Then we haven't anything to do with the man who has typhoid and doesn't know it, have we, in this investigation?

A. I don't see how we can get him in here as a specific basis of computation.

Q. Well, we will just leave him out and take what we have got then.

A. Yes, that is best.

Q. Assume as a fact that in the city of St. Louis in 1897, there were 433 cases of typhoid; in 1898,—426 cases of typhoid; in 1899, 908 cases of typhoid; in 1900, 1213 cases of typhoid; in 1901, 1101 cases of typhoid; in 1902, 1112 cases of typhoid, as testified to by Dr. Ravold, and as illustrated by the chart that has been offered in evidence, and assume that those figures are true, would the fact that 160 deaths occured in 1900, as 4218 against 198 in 1901, be evidence that typhoid had increased in the city of St. Louis, when the facts are that the number of cases decreased?

A. I should never base conclusions in a typhoid epidemic upon the number of cases which were reported, for reasons already stated, and there is no question that an increase from 160 deaths to 198 deaths shows an increase of typhoid in the city.

Q. Don't the number of deaths from typhoid largely depend upon the unskillful attention that the patient receives, whether from doctor or from nursing?

A. It depends somewhat upon that, and also upon the amount and intensity of the infection that he has, I should judge.

Q. Well, don't it depend largely on the number of deaths in cases of well defined typhoid—doesn't the number of deaths in that number of cases depend upon the skill of the physician; the enviroments, the attention and the nursing that the patients receive?

A. There is no question but the mortality in typhoid is affected by the skill of the physician, the care of the nursing and attendants and so on; but the history of typhoid in the United States shows by the decrease in deaths from it as time goes on, that we are acquiring continually greater and greater skill in the handling of the disease, and the assumption is, and 4219 it is well borne out by the facts, that we are able to handle it better than before, and considering those facts, I should say that the probability was that less people die of typhoid fever, —or would have died of typhoid fever, out of the same number of cases in 1901, than would have died of it in 1900.

Q. Now if we assume that the number of cases, as is illustrated upon the chart that is already in evidence, is true, and that those cases started in 1896 with 291; 1897, 433; 1898, 426; 1899, 908; 1900, 1213; 1901, 1101; 1902 1112, would you say, as an expert sanitarian, that the typhoid conditions existing in St. Louis for 1900 and 1901 and 1902, were attributed to the drainage Canal of Chicago and not to the same causes which created the uniform increase in typhoid fever from 1896 up to 1899?

A. Assuming that these figures given are correct, which I judge to be the case,—as representing the number of cases of typhoid fever which were reported, but which I absolutely deny to represent the number of cases that existed in St. Louis during any of the years in question—

Q. Well, just assume the facts in my question as true.

GENERAL CROW: He is answering it. Go ahead with your answer.

4220 A. (Continuing) I consider that the records of cases in the city of St. Louis in regard to typhoid, proved nothing except that all the cases were not reported in the earlier years, and are not reported now.

Q. Suppose that this number of cases reported, had all died, and what is here assumed as the number of cases was assumed as the number of deaths, then what conclusion would you arrive at?

A. I would say that St. Louis was getting into Chicago's class.

Q. Well just eliminate Chicago for a second and confine ourselves to the conditions in St. Louis.

A. All right. Now give me the straight question.

Q. Regardless of Chicago's class—

A. Without modification, just give me your straight question in a few words now.

Q. Assume that the number of cases—

A. Cases or deaths?

Q. The number of cases as I have given them to you, from 1896 to 1902, were deaths, to what would you attribute the gradual increase in typhoid fever in the city of St. Louis from 1896 to 1902?

A. To gradually increased infection from somewhere.

Q. Where?

4221 A. I don't know. I would have to investigate the matter to see. Inasmuch as the condition assumed is contrary to the fact, I have not taken the trouble to investigate it.

Q. Would the fact that the number of cases, instead of being typhoid cases, were typhoid deaths, change the conditions to you?

A. Change the conditions of what, Mr. Todd?

Q. As to the cause?

A. If I were confronted with such a record of deaths as this in the city of St. Louis, it would very materially change my view as to the cause of the increase, temporarily, at least. I might ultimately come to the same conclusion, but with those statistics before me I do not consider the case at all comparable with the one that I have been investigating at first sight.

Q. Assuming that these figures which show the number of cases—that all the cases died, and this represented the total number of typhoids in St. Louis—

A. You want mortality percentage of 100 in this case—everybody died?

Q. Yes sir.

A. All right.

Q. Would that change the condition?

A. Well, I think the answer to the last question was substantially the answer to this. If I were confronted with that condition of affairs in St. Louis I should certainly make a further investigation as to the cause of such conditions existing. 4222

Q. Suppose that this number of cases none of them died, and by the best scientific knowledge of today, these cases were tested in the laboratories and ascertained to be typhoid fever, and included all the typhoid in the city of St. Louis, to what would you attribute, knowing all the conditions that existed during those seven years, as you do, to what would you attribute the gradual increase in the number of cases, from 1896 to 1902?

A. I couldn't say without making a study of the conditions with such facts in view, these facts being contrary to those existing, have not been considered in my investigation of this case.

Q. Do you deny and have you any facts upon which to base that denial, that the number of cases as assumed in my question, is not a true condition in the city of St. Louis?

A. As assumed in your last question?

Q. Yes?

A. I certainly do deny it.

GENERAL CROW: True representation of all the cases you mean?

MR. TODD: True representation of all the cases.

4223 A. I certainly do deny that it is a true representation of the conditions in St. Louis.

Q. Upon what facts do you base that denial?

A. Upon the fact that any such mortality as is indicated by the record for instance of 1896, where you have 291 cases and 106 deaths, is so preposterous, from the standpoint of all knowledge and history of typhoid, that it is simply absurd to advance or consider any such proposition.

Q. In your consideration of this question did you take into consideration the sewage from Peoria?

A. I did.

Q. What is the amount of sewage that enters the Illinois river from Peoria?

A. I don't know.

Q. Do you know how many cattle are fed at Peoria?

A. I don't recall at the present moment.

Q. Have you any idea of the number?

A. Oh, it is a very large number.

Q. How many would you say?

A. Oh, I could only make a guess. I know that Peoria is a place where cattle are very extensively fed, and it probably compares—

Q. Have you investigated the character of the sewage that comes into the Illinois river from Peoria?

A. Not particularly.

4224 Q. Do you know the difference between the sewage from distilleries and that from slaughter houses?

A. Why, there is some difference.

Q. Do you know whether there is any difference between the sewage from distilleries and the sewage from glucose factories?

A. Oh, there certainly is.

Q. Do you know whether there is any acids discharged into the river from a large glucose factory?

A. There would be likely to be.

Q. Do you know in what quantities?

A. I do not.

Q. Do you know whether any acids would be discharged into a river from distilleries?

A. It would be likely.

Q. What effect would the discharge of acids into a stream the size of the Illinois, from large distilleries at Peoria, and glucose factories at Peoria, have upon the life of the typhoid bacillus?

A. Oh, that would depend very much upon the alkalinity of the water in the first place. Under some conditions it might tend to prolong it, under other conditions it might tend to decrease the life of the bacillus.

Q. Have you ever made any experiments under those
4225 assumed conditions?

A. What are the assumed conditions please?

Q. Such as you have stated?

A. I have assumed no conditions.

MR. TODD: Read that last question and answer.

(Question and answer read). Those are the assumed conditions.

A. Not personally.

Q. Do you know of anybody who has?

A. The life of typhoid fever bacilli in alkaline and salt waters has been experimented upon and compared with its life in slightly acidic waters—

Q. Do you know of anybody who has made experiments with the typhoid bacillus in water impregnated with the sewage discharged from a distillery or glucose factory?

A. I am not aware of anyone who has done so, at the present moment.

Q. Do you know whether that discharge would tend to increase or decrease the life of the typhoid bacillus?

A. I am not able to say postively, it might do either.

Q. Then if you are not able to say whether it would or it would not, can you say whether or not a typhoid bacillus on his journey from Chicago to St. Louis coming in contact with the sewage laden water at Peoria from the distilleries and gluclose factories, would be able to live the journey?

4226 A. I cannot say whether a specific typhoid bacillus would or would not be able to live under the circumstances assumed.

Q. Can you say whether a whole tourist excursion of those bacilli would live or not?

A. I think it is entirely probable that some of them might squeeze through.

Q. Upon what do you base your doctrine of probability in the absence of any specific knowledge as to whether the individual bacillus would live in a medium of that character?

A. The fact which is very evident to my mind, that certain typhoid bacilli or some typhoid bacilli started from Chicago have lived, passed through the Illinois river and infected the water supply of St. Louis, and produced typhoid in those who have used it.

Q. Do you know of anyone that has ever been able to prove that the typhoid bacillus that left Chicago ever arrived in St. Louis?

A. I think we have pretty nearly proved it in this case.

Q. Well, eliminate "we" do you consider that you have proved it?

A. I don't know that I want to say that by my own individual self I have proved it, but I think it has been proven.

Q. Well nobody knows any more about this subject than you do, do they?

4227 A. Well, I don't think that anybody knows very much more.

Q. And do you know it all?

A. Oh no.

Q. Do you know whether before the typhoid bacillus that leaves Chicago can get into the intake tower at St. Louis, it must pass by Peoria, must it not?

A. It must pass somewhere in that neighborhood, certainly.

Q. Do you know how many distilleries empty their filth and sewage into the Illinois river at Peoria?

A. No, I do not, but I don't imagine that the number is any greater than formerly emptied there.

Q. How many emptied there formerly, if you know?

A. I don't know; but I don't imagine that it was very many less than do now.

Q. Well, does that give you any idea as to the amount—the fact that no more empty into the Illinois river now than did formerly?

A. No, but I don't see that it is of any importance whether there are one, one hundred or one thousand in that case.

Q. Do you know the character of the sewage that comes from a distillery?

A. Moderately, I have some knowledge of it.

Q. Do you know how long a typhoid bacillus will live in that kind of sewage?

4228 A. I shouldn't expect it to live a great while.

Q. Do you know what the character of the sewage that comes from a glucose factory is?

A. Oh, I have a moderate idea of it.

Q. Will a typhoid bacillus live in that medium any length of time?

A. I couldn't say.

Q. Can you say whether they would or would not live based upon any scientific knowledge, in a medium the size of the Illinois River at Peoria, receiving the discharge from the four distilleries there and the large glucose factory?

A. I certainly could, because they evidently do.

Q. Or the number of distilleries there—

MR. JEFFRIES: We object to the question for the reason that the comparison before and after the opening of the canal cannot be properly made so far as the fact of the sewage from these distilleries and glucose factories is concerned, because of the increased volume of water coming down the Illinois river by means of the opening of the canal.

MR. TODD: In reply to the objection I will state that my question does not include the subject of your objection.

Q. Have you ever been able to identify any bacillus of typhoid found in the Mississippi river above the intake as being indigineous to Chicago and not coming from the other

4229 towns located upon the watershed of the Mississippi river, above its intake, the Missouri and Illinois?

A. Certainly not, and it would be absolutely impossible to do so any more than it would be possible to determine from what source a potato came that you might find floating in the river.

Q. Would the fact that you found a potato floating in the river prove that it came from Chicago?

A. Certainly not.

Q. If you are not scientifically able to state that the sewage conditions existing in the Illinois river at Peoria, do not kill the germs of typhoid, or do not aid in its longevity, and a condition existing below Peoria on the Mississippi river, where other typhoid germs may come from other places, how are you able to state that the typhoid germ will pass through the sewage polluted Illinois river at Peoria?

MR. JEFFRIES: We object to the question for the reason that Chicago is not responsible for the distilleries at Peoria, and so far as this record is concerned, there is nothing to show that they contribute anything to the maintenance of the distilleries at Peoria, which kills off the germs, if they do so.

MR. TODD: In reply I will state this is not a case against Chicago, but a case against the State of Illinois.

4230 GENERAL CROW: Well, we could show the same thing in regard to Illinois; that they did not build the distilleries.

Q. (Question read).

A. Because it is entirely possible that the typhoid germ might pass through the sewage polluted Illinois river at Peoria without coming in contact with the sewage from the distilleries and glucose factories that you have been discussing, if such exist.

Q. Do you know that to be a fact?

A. Oh, I think there is no question about it.

Q. Or, is it a matter of reasoning?

A. It is a fact.

Q. Can you demonstrate it scientifically?

A. I think so.

Q. When did you first begin the investigation of the germ known as anthrax?

A. Sometime in 1895.

Q. And the germ of tetanus?

A. About the same time.

Q. Have you ever known of anybody catching lockjaw from drinking the germs of tetanus?

A. No sir.

Q. Is it contended that people get it by taking it in through the alimentary canal?

4231 A. I believe not.

Q. So that it doesn't make any difference whether that germ goes through the drainage canal or not?

A. I think it does.

Q. Would it have any effect upon the health of a man who drank it?

A. I don't know that it would. It might or it might not.

Q. What is your opinion about it?

A. It would depend upon the condition of his intestines.

Q. Well, assuming that the ordinary citizen of St. Louis has a normal intestinal tract the same as other people, what is your opinion about the effect of the germ of tetanus?

A. I think it is possible that he might get lockjaw from taking it internally, even though his intestines were all right. For instance, he might have a raw place in his throat, due to a cold or something of that sort.

Q. Is there anything beyond the bounds of possibility in the sanitary science or epidemiology?

A. I think there is, for instance that the typhoid fever germs contributed by the Chicago Drainage Canal should all die before getting to the St. Louis intake.

Q. Anything else except that?

A. Oh, there may be others.

Q. Assuming that there should be typhoid fever in New
4232 Orleans, and two months before one case of typhoid fever
appeared upon a steamer in Lake Itasca, the source of the Mississippi river and there were no other cases of typhoid fever between that point and New Orleans—

A. And no other source of infection I suppose you mean?

Q. Yes. Would you attribute the cases in New Orleans to the cases in Lake Itasca?

A. I am afraid I would have to. These things do not generate of themselves.

Q. Has that been demonstrated?

A. Well, there are several who have tried very hard to demonstrate that they did, and they have slipped up on it, given it up.

Q. Were they epidemiologists?

A. I think so. I think they would be ranked as such. Pasteur was one of them, at least.

Q. Now, in regard to this anthrax occurring in Chicago. Did you ever hear of a case of anthrax in the City of Chicago?

A. I don't know that I have. No, I am free to say that I have not heard of a case coming from the City of Chicago.

Q. If a case of anthrox should appear 200 miles south of St. Louis on the Missouri side, and the cause was drinking Mississippi river water, would you attribute that to the sewage of the Chicago drainage Canal?

A. Not necessarily.

4233 Q. Do you regard the sewage of Chicago as a greater menace to the inhabitants of Missouri than the sewage discharged by the City of St. Louis into the Mississippi—

A. Certainly.

Q. Than to those lying south of St. Louis?

A. Yes, I think I do because if Chicago were not around, St. Louis wouldn't have so much typhoid, inasmuch as Chicago increases apparently the typhoid in St. Louis, she therefore makes the sewage of St. Louis so much more of a menace, and I think is to be charged with quite a bit of the account on that view of the case.

Q. Assuming that Chicago sewage should be cut off, what would you say about the condition of the Mississippi river on the Missouri side to the people in Missouri drinking the waters of the Mississippi after it had received the sewage discharge of St. Louis?

A. I should say it would be unfit water for them to drink.

Q. Is there any more liability of anthrax occurring in Chicago than in St. Louis?

A. I don't know that there is.

Q. Is there any more danger of hog cholera occurring in Chicago than in St. Louis?

A. I don't know that there is.

Q. You spoke of hog cholera appearing in the stock yards
4234 of Chicago?

A. Yes, sir.

Q. Are you acquainted with the conditions at the stock yards?

A. Only to a moderate extent, but if there are live hogs there, it is entirely probable that hog cholera may be present, and I imagine that there are live hogs there most of the time.

Q. Do you know whether or not every hog is inspected before it is admitted to the Chicago Stock Yards?

A. No, sir; but inspection cannot determine the presence or absence of hog cholera absolutely, any more than inspection can determine the presence of typhoid in a person coming down with it.

Q. Do you know that in the treatment of the hog, how much of that residue gets into the drainage system of Chicago?

A. I know that it is a very small portion.

Q. Did you when you dipped into the future, anticipate a cholera of hogs along the Missouri shore as due to Chicago?

A. It is entirely possible to get it.

Q. Isn't it more possible that if they did get cholera along the southern border of Missouri south of St. Louis along the Mississippi that it should come from St. Louis more likely than from Chicago?

A. It is entirely possible that it should come from there. Yes, I think it would be more likely that it came from there. I should look in St. Louis for the source of infection before
4235 I looked in Chicago.

Q. When you looked into the future and saw an impending calamity of cholera, did you really believe that such a thing was possible?

A. I certainly did and certainly do.

Q. Of Asiatic cholera.

A. Of Asiatic cholera. I see no reason why an epidemic of Asiatic cholera might not be brought into the United States almost at any time, and if so brought, I think Chicago is in a position where she is particularly likely to get it.

Q. More so than St. Louis?

A. Yes; vastly.

Q. With a World's Fair coming on and with people from all of the Orient coming here, do you think that Chicago is more likely to get it?

A. That is only next year, and they all pass through Chicago anyway.

Q. You believe then that Chicago is more likely to get Asiatic cholera than St. Louis?

A. I do, yes; in the event of its coming to this country at all.

Q. Now, in regard to anthrax, the case you spoke of appeared here in St. Louis. Do you know whether that was due to the water of the Mississippi?

A. I think so; it has been attributed to the water.

4236 Q. Who attributed it to the water?

A. The man who had the case.

Q. Who had the case?

A. A physician here in town.

Q. What is his name?

A. A. Ravold.

Q. Did you say that Dr. Ravold attributed that to the drinking water as a certainty?

A. Dr. Ravold attributed it to the water as being the most probable source.

Q. What water?

A. The water which was used for domestic purposes in the City of St. Louis and which came from the public system.

Q. Is that the only case of anthrax that has been found here?

A. I think not.

Q. What other case has ever been found here?

A. I have been informed there have been other cases, but I haven't any specific information on the subject.

Q. The case of anthrax to which you referred; do you know the history of it?

A. I have been told something of the history of it.

Q. That was the case where the woman was scrubbing the floor and got a piece of slate in her hand, wasn't it?

4237 A. No, sir.

Q. What were the facts?

A. I believe she was scrubbing a sink and got a piece of slate in her hand.

Q. Any other facts in the history that you know connected with it?

A. It was proved to be a case of anthrax. Inquiries were made to ascertain the source, and it was impossible to ascertain that there had been anything in the neighborhood of the sink that might have communicated the germ; at least it was not ascertained that there had been, other than the water, and knowing that bacillus had already been found in the waters of the Illinois river, it is at least a moderately justifiable assumption to say that it may have come from the water, and in fact very probably did.

Q. Would you assert from the history of the case as you got it, that the water is the only explanation?

A. No, sir; not for a minute.

Q. But the man who discovered it, gave it that explanation?

A. I think, as I understand it, he was unable to explain it for a considerable time, and at last concluded that the water was the most probable explanation.

Q. Was it attributed to the water of the Illinois river?

4238 A. I couldn't say, not specifically.

Q. When you look into the future do you expect to see an anthrax epidemic in Missouri?

A. I shouldn't be surprised, understanding that there has been an epidemic of it in Missouri in the past few years.

Q. How long ago was it?

A. I couldn't say exactly, a matter of a few years.

Q. As much as five years?

A. It may have been. I am not certain. My impression is it was two or three years ago. It may have been four or five.

Q. Was that before or since the opening of the drainage canal?

A. I couldn't say; I didn't inquire.

Q. Well, if it was prevalent here prior to the opening of the drainage canal and the germ of anthrax is indestructible, would you as a scientist who dips into the future, attribute a subsequent epidemic to any contagion that might come from Chicago?

A. I shouldn't be inclined to attribute an epidemic of anthrax to Chicago upon its first appearance, but knowing the intimate relations which exist between Missouri, or between Chicago and St. Louis, I could readily conceive that the anthrax beginning in Missouri might travel to Chicago, infect the
Chicago sewage and come back to Missouri with redoubled
4239 force as a result, and that such is quite probable, and that
the existence of such a possibility is an added menace to
the health of the people of the State of Missouri.

Q. Suppose these cattle that you spoke of should also be shipped to Kansas City, Kansas, on the Kaw river, wouldn't they come down to Missouri?

GENERAL CROW: Do you mean cattle or anthrax?

MR. TODD: I mean anthrax?

A. I should think that possibly they might and in fact probably they might.

Q. Now, if some of these cattle with this disease should be shipped to Kansas City, Kansas, and to Chicago and anthrax should break out on the shores of Missouri, would you as an epidemiologist be able to tell whether it came from Chicago, or whether it came from Kansas City, Kansas, or not?

A. Not without considerable more knowledge of the facts than your question implies, and I doubt if even with the knowledge that I could get, it would be possible to separate the thing, in any practical case.

Q. How many epidemics have you personally investigated?

A. Four or five.

Q. Is there any school which graduates a student with the degree of epidemiology?

A. Not in this country, at least, that I am aware of.

4240 Q. I mean in this country?

A. Not that I am aware of.

RE-DIRECT EXAMINATION, by General Crow.

Q. I believe you stated in answer to Judge Johns' question that you only found recorded in the official records two cases of typhoid fever in the year 1891 in Port Huron?

A. I did so state.

Q. Now, do you know whether they kept any official records, or made any official reports prior to 1891, in Port Huron?

A. They made no regular reports in Port Huron prior to 1893, I think.

Q. Well, then, the two cases in 1891 were not officially reported?

A. Well, they seem to have been accidentally reported by somebody.

Q. By whom?

A. I think they were reported to the State Board of Health, although I am not positive as to that, as I got the statistics at that time from both the State Board of Health and from the local Board of Health of Port Huron, and from among those statistics I was able to locate the two cases in question.

Q. Well, the city records of Port Huron, do they disclose
4241 any official recording of mortality from typhoid fever,
prior to 1891, or during 1891?

A. Well, I am not able to state positively at the present time, my impression is that in general there were not established satisfactory records in Port Huron previous to the latter part of 1892.

Q. Well, speaking generally from your information, do you know or have you any reason to believe that there were other cases in 1891 and prior to 1891, for several years, of typhoid fever in Port Huron?

A. Yes, there was no doubt about it. For instance, the report of the State Board of Health of Michigan for 1890, page 219, relates, or rather shows that four cases of typhoid occurring elsewhere in the State of Michigan were attributed by the health officers there to an original infection in Port Huron, which of course would indicate that there must have been typhoid in Port Huron at that time, and the report for 1891 (page 237) reports that the cause of 9 cases and 2 deaths of typhoid in Sanilac county, which is the next county to St. Clair county in which Port Huron is situated, is reported by the health officers of the respective communities, as being traced to an unreported outbreak of typhoid in Port Huron: And again in the report of the State Board of Health of Michigan in 1892, page 252, there
are reported 50 cases and 26 deaths throughout the state
4242 traced, on the authority of the health officers who re-
ported these cases, to the State Board, to another unreported outbreak in Port Huron; and on page 268 of the Report of State Board of Health of Michigan, for 1893, there are reported from Port Huron 22 cases and 2 deaths of typhoid, and in the same year there are reported five cases and two deaths as being traced to Port Huron as the source of the infection. So that if in all the reports from the state there were in 1893, 5 cases and two deaths traced to Port Huron, and 22 cases and 2 deaths reported in Port Huron at that time, it seems to me

at least fair to assume that there being nine cases and 2 deaths traced to Port Huron in 1891, there must have been probably more typhoid there at that time than there was in 1893, and similarly again in 1892, fifty cases and 26 deaths were traced to Port Huron—I may say incidentally that the records at Port Huron show a large number of cases of typhoid in Port Huron during 1892, there being as many I think as 193 in one month, and bearing in mind, moreover, that the typhoid fever was in Michigan at this time very common and an ordinarily prevalent disease, and the character of the population of Port Huron, the situation of the town and also the testimony which had been given me by the health officer at Port Huron, that typhoid fever was a common disease and prevalent very nearly all the time there during the years preceding 1897, when
4243 I made inquiries of him, I think there is no question whatever, no doubt whatever, that there was a large amount of typhoid prevalent in Port Huron in 1891, and in the early part of 1892, and for years previous and years following that time.

Q. Mr. Williams, I will get you to state, if you can, as to the least time, about what the least time, you think under the conditions as they ordinarily exist, that water would flow from the point where the material dredged from the Black river in front of Port Huron was dumped into river St. Clair down to the intake of the Detroit Waterworks in the year 1892?

JUDGE JOHNS: Object to the question as not proper on re-direct examination.

A. Somewhere in the neighborhood of eight days.

Q. GENERAL CROW: Mr. Williams, I will get you to state if you have considered at all the effect of the Illinois and Michigan Canal, the sewage as pumped into it by the pumps at Bridgeport prior to the year 1900, say in 1899 and prior thereto, and its influence, if any, upon the water supply at the intake tower in the City of St. Louis?

A. I think it is entirely possible that the water passing through the Illinois and Michigan canal may have contributed somewhat to the typhoid in St. Louis, but it very evidently did not contribute very largely to that because the typhoid in St. Louis was not excessive during those years, and more-
4244 over that amount of water passing into the Illinois and Michigan Canal at Bridgeport was not sufficient to take

care of anywhere nearly the sewage of Chicago. In times of freshet the current of the river was turned toward the lake, and very large quantities of sewage material were washed out into the lake to the serious pollution of the water supply of Chicago, the washings having the effect of forcing the people of Chicago to extend their intakes in an endeavor to get beyond them, and ultimately to build the drainage canal, in order to prevent a recurrence of such discharges of filth into the lake, which was their water spply.

Q. Do you know whether some of the sewage yet of the sanitary district goes into the Illinois and Michigan Canal?

A. My impression is that some of it does.

Q. Mr. Williams, you have no accurate knowledge as to the fall from Morris to Peoria?

A. Except as I got it from profiles, and published data, supposed to be authoritative. Well, the elevation of the crest of the Copperas Creek dam is given as 149 below the dam and the elevation of the Marseilles dam is given as 101, which would cause 48 feet there substantially. I was speaking of the river level, of course.

Q. Now, Mr. Williams, in answer to the question of Mr.
4245 Todd in which he assumed that Minneapolis and Kansas City were rivaling each other to convey typhoid in the same space of time to the citizens of St. Louis, he asked you whether or not it was possible to tell provided all other things were equal and no other source of infection were open, whether the typhoid came from one city or the other. Now, I will ask you to state if there is any way to tell when typhoid germs have been once placed in the water, when and where they will convey that disease to persons drinking that water?

A. Not absolutely and specifically. You can be pretty sure they would be likely to convey it to any persons when they drink the water, within a period of time through which they may live. As that period is yet indeterminate it is impossible to state whether they will or will not at certain places. While we can be pretty sure that at certain other places they will convey infection.

Q. Now, in answering a question in your cross-examination, you gave several things that you would consider in determining

whether or not the Chicago sewage, if it was infected with typhoid germs, would be likely to infect the water coming into the intake tower at St. Louis Waterworks; now, I will ask you to state if you would consider the time factor, that is the time within which it would take water bearing infected sewage to flow, an important item in making up your judgment
4246 on the question?

A. I certainly should.

Q. Well, how much importance would you give to that factor of time?

A. Well, it is hard to state any percentage, but I should consider it as one of the most important factors to consider. In fact, next to the fact that infection was put in, I think I should consider the time it took to get somewhere else.

Q. Mr. Todd asked you a question today as to whether or not if there were any additional facts that might come to your knowledge as to the prevalence of typhoid fever in the cities from which the complainant has introduced reports, from the watershed tributary to the intake of the St. Louis Waterworks, if these facts might or might not affect the conclusion you would arrive at, and I think you stated in a general way that perhaps they might not affect your judgment materially. Now, I will ask you if you meant to convey by that answer the impression that no facts that might come to your knowledge bearing upon the subject of typhoid infection in water, would not affect the conclusion you would arrive at?

A. I will say in answer to that question I had in mind the difference of the significance of the words "might" and "could," the questioner using the word "could." What I meant
4247 to imply, or what I meant to convey by my answer was that it didn't seem to me possible that any facts could be adduced which had not already been considered, that would have a sufficiently important bearing upon the question to change my opinion upon the general proposition. I did not mean of course that my opinions were not subject to modification as additional facts might be brought out.

Q. I will ask you Mr. Williams, if in your examination of the typhoid statistics whether or not you found the increase in typhoid fever in St. Louis had been continuous and regular since the 17th of January, 1900, generally speaking?

A. I found that it has been regular and continuous, and that up to the very last date at which we have a record, it shows itself continuing and increasing.

Q. Now, in studying from the standpoint of an epidemiologist, the effect of disease in a community, what effect would the continuous rise in the mortality rate for certain diseases in the city have upon the opinion of a man in figuring out as to whether it came from a local cause or came from a cause that existed theretofore when conditions had not changed, except in the one respect to which the increase in death has been attributed?

A. Any one in studying the conditions of nature, is compelled to look for a cause for every effect, and if it were found that certain diseases were increasing the natural inference and proper assumption would be that there was a continuing and increasing cause for the existence of that disease, and if it should prove upon investigation that at a certain time this increase began, we should look at that time for the beginning of the cause which was leading to the increase. 4248

RE-CROSS-EXAMINATION, by Mr. Todd.

Q. In your investigations in regard to increase, did you take into account the number of cases or the number of deaths?

A. The number of deaths.

Q. If the number of deaths should show an increase and the number of cases a decrease, or normal for 1901 and 1902, what would you say?

A. I would say as I have stated already, that I consider the death record decidedly more reliable than the record of cases and therefore I very seldom gave to the cases any great amount of consideration in investigations of this kind, and I think in fact, my usage is in accordance with all others who investigate these subjects for the reasons which I have already stated.

Q. If you should find that the cases had been accurately diagnosticated, would that change your views any?

A. No, sir; it is not a question of diagnosis at all; it is a question of report and a question of ascertaining the cases.

4249 Q. Suppose it should appear that the cases reported were the correct number of cases existing, and the cases reported were correct diagnostications of the cases, would that affect you any, or would you still adhere to the death standard?

A. I should consider that in all human probability, that the death standard would be the safer one to rely upon. If it were absolutely proved that the other were the case, that is, that the number of cases represented all the cases, and that the probability of a correct diagnosis was the same as in the case of deaths, I should then give the record of cases an equal weight with the record of deaths.

GARDNER S. WILLIAMS.

MR. JEFFRIES: Now we formally offer, at the conclusion of this witness' testimony a certified copy of the typhoid fever deaths for the various years previously stated, at Kansas City, Missouri; St. Charles, Missouri; Council Bluffs, Iowa; St. Joseph, Missouri; Lincoln, Nebraska; Omaha, Nebraska; Chicago, Illinois; Davenport, Iowa; Moline, Illinois; Rock Island, Illinois; Galena, Illinois, and Warsaw, Illinois.

MR. TODD: I object to the documents as incompetent.

THE COMMISSIONER: On suggestion of the Attorney-General of Missouri, complainant's Exhibit No. 22 was withdrawn, for correction, defendants' counsel consenting thereto.

The documents above offered, are in words and figures as follows, to-wit:

(Signed) Will H. Hartigan.

Adjourned until 10 A. M., Friday, May 29, 1903.

4278 Southern Hotel, St. Louis, Missouri. 10:00 a. m., Friday, May 29, 1903.

Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

GEORGE W. FULLER,

called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Attorney-General Crow, and testified as follows:

Q. Please give the stenographers your full name and address.

A. George W. Fuller, New York City.

Q. Mr. Fuller, please give me your occupation also, will you?

A. Sanitary expert.

Q. You are now engaged in that business?

A. Yes sir.

Q. Where were you professionally educated?

A. At the Massachusetts Institute of Technology in Boston, and the University of Berlin, Germany.

Q. Have you received an education as a bacteriologist?

A. Yes, I may say that I have, although that is not the particular branch of sanitary work which I gave the most attention to while at the Institute of Technology. That was the principal topic which I studied at Berlin, both at the 4279 hygienic institute and in the private laboratory of the engineer in charge of the filter plant of the Berlin waterworks.

Q. Have you been educated in chemistry?

A. Yes sir, it was from that department which I graduated at the Institute of Technology in Boston.

Q. You are also a practical constructor and engineer in the construction of water plants?

A. In regard to the necessity and advisability of treating water supplies by artificial processes, I would say that I have given that matter special attention, and with regard also to plans and specifications. I am not in the constructing business; not in the contracting line, nor do I ordinarily supervise construction.

Q. After your graduation from the Institute of Technology in Boston, did you have charge of any institution connected with the line of work for which you were educated?

A. Yes sir, after returning from Europe the first time that I was abroad, that is directly after my graduation from the Institute of Technology, I spent five years in the service of the State Board of Health of Massachusetts and the greater portion of that time I was stationed at Lawrence, where they have an experimental plant conducted with a view to finding the best ways of purifying sewage and water. I was for the 4280 greater portion of my stay the officer in immediate charge of that station.

Q. Well, as the officer in charge of that station you were engaged then for five years in experimenting with water and the influence of sewage upon water?

A. Yes sir.

Q. Now where did you go to from that point?

A. I spent four years, after leaving Lawrence, in the valley of the Ohio river, at the cities of Louisville and Cincinnati, being engaged in studying the best means of purifying the polluted Ohio river water as found at those cities.

Q. You were engaged upon that work professionally?

A. Yes, I was in charge of quite extensive studies and investigations. I suppose at those two places there was a hundred and fifty thousand dollars spent under my immediate charge, finding out the character of the Ohio river water at those two cities, and the best means of purifying it. By that I mean the cheapest way of accomplishing a practical and satisfactory result.

Q. Was a record kept of those results?

A. Yes sir, and they have been published in full.

Q. In what other places and cities in this country have you investigated water supplies?

A. Well for the past four years I have been in private 4281 practice, and have made investigations I suppose in upwards of twenty-five or thirty different cities, among which are a number of the larger ones in this country. I might mention the city of Washington, as one of these places where I was connected professionally, as a member of the special commission appointed by the United States Senate Committe of the District of Columbia, which committee had in charge the ways and means for treating in the best manner, the sewage polluted Potomac river water, which is the source of supply for Washington City.

Do you want me to enumerate?

Q. Yes, you might mention two or three more, if you feel like it.

A. I will mention Springfield, Massachusetts; New Haven, Connecticut; Oswego, New York; Meadville, Pennsylvania; York, Pennsylvania; Columbia, Pennsylvania. The group of cities lying directly west of New York, furnished by affiliated groups of water companies with their public water supply, that is, Paterson, Passaic, Jersey City, Hoboken, etc. I have also made examinations in a number of places throughout the Southern country, down in Mexico also, on the western coast at Manzonillo.

Q. All of these examinations were made in the capacity of a water supply expert?

A. Yes sir.

Q. Are you a member of any sanitary and scientific organization in this country? 4282

A. Yes sir. I am a member of the American Society of Civil Engineers; the American Chemical Society; the Society of American Bacteriologists; the American Public Health Association; the American Waterworks Association—

Q. Are you a member of the American Society of Naturalists?

A. Yes sir.

Q. In connection with your membership in the American Public Health Association, I will ask you if you had any special work relating to water supplies for cities and towns?

A. I have given that matter quite a little attention in that connection, having been for a number of years Chairman of the Committee on the Pollution of Public Water Supplies, and also chairman of another committee having to do with the question of standard methods of water analyses.

Q. Mr. Fuller, speaking broadly and generally, are you familiar with the principal facts in this record in this case, and the essential facts from a sanitary standpoint, as associated with the quality of the St. Louis water supply?

A. Yes sir, I am.

Q. Mr. Fuller, will you please state whether or not you know the general features of the system of waterworks in the city of St. Louis as regards the source of supply and the treatment of the water, artificially, in recent years, and if you know these general features please state them. 4283

A. I am familiar with the general features regarding the source and the method of treatment of the water supply of St. Louis.

The Mississippi river for many years has been the source of supply. Some thirty years ago or more, the municipal water department established an intake at Bissell's Point, near the present Merchant's Bridge. At that place there were provided four settling basins, each having a capacity of about 15 million gallons. The water from the river was pumped to these basins, in which it was settled, that is, partially clarified, and partially purified, and then the water leaving those basins was pumped into the distributing mains conveying the water to the citizens of St. Louis. Those works continued in service until the autumn of 1894. For some ten years preceding that time, attention had been given to the question of locating a new point of intake. This matter I think, was first looked into about 1885 or 1886. For several years following that, as soon as the enabling acts were passed, construction was carried on for the completion of the works, as they now exist at the Chain of Rocks. The object of moving the intake from Bissell's Point to the chain of rocks some eight miles or so, up-stream, from Bissell's Point, 4284 and some six miles below the mouth of the Missouri, was with the view to avoiding all possibility of sewage pollution of the Mississippi water at Bissell's Point, due to the inhabitants of St. Louis, in the Northern district, and in which district the population had increased rapidly since the time that the Bissell's Point plant was constructed.

At the chain of rocks there is a tunnel constructed through the solid rock, extending out from the Missouri shore some 1500 feet, and terminating in an intake tower located on the Missouri side of the main channel of the river; the water entering this intake tower flows by gravity through the tunnel, which connects with a suction well 100 yards or so distant from the shore. From this suction well the water is pumped by the low lift pumps situated in the station adjoining the suction well, to a series of six settling basins. These basins are each about 660 feet long, 400 feet wide, and have an average depth of water of about 15 feet when full. Their capacity is about 29 million gallons each. The river water in passing through these settling basins is clarified to a considerable degree, as there is left in the form of deposit a large amount of the mud obtained from the raw river water. There is also removed a considerable portion of the bacteria, including those of infectious diseases if such are present in the raw water.

4285 From these settling basins at the chain of rocks, the water flows by gravity through a masonry conduit leading to the old waterworks plant at Bissell's Point, where a portion of the water is taken by the pumps in the original station, and delivered to the consumers. A part of the water, however, since 1897, has been taken from this conduit say about half way between the Chain of Rocks and Bissell's Point, at a point called Baden. At Baden there is what is known as the high service pumping station where there is pumped a considerable portion of the water going to the high service districts, the hilly portions of the city of St. Louis.

Q. For this time and for years you have been engaged in no other business professionally, except that of examining and advising about the water supplies for cities and towns?

A. No sir; none except that and the allied line of sewage disposal.

Q. Mr. Fuller, do you know from what period of time the water has been taken from the intake tower in the channel of the Mississippi river at the chain of rocks, and do you know whether or not the treatment has been essentially changed from the period of time at which the water was begun to be taken from the channel of the Mississippi river at the chain of rocks?

A. The water supplied to the city of St. Louis by the municipal water department has been taken from the chain of 4286 rocks since the late autumn of 1894, and from that date to the present time there has been no essential change in the method of treatment of the raw water taken as the source of supply, treated and delivered to the citizens of St. Louis.

Q. I will get you to state if you know who owns the water plant which supplies the city of St. Louis with water?

A. It is owned by the municipality.

Q. Mr. Fuller, I will get you to state as a sanitary and water supply expert, what you consider to be the best index to the sanitary character of a public water supply?

A. As a general proposition it is my judgment that the best index to the sanitary character of a public water supply is the mortality record from water-borne diseases in the community using the water supply in question, and especially the mortality statistics of typhoid fever.

Q. Mr. Fuller, I will get you to state why the mortality statistics of typhoid fever are a better index in your judgment, to the character of a water supply in a community, than those of other water-borne diseases?

A. It is my experience that the typhoid fever mortality statistics are preferable to those of other water-borne diseases for a number of reasons, of which the principal ones, are the wide-spread nature and distribution of typhoid fever, its abundance in those communities having supplied to them sew-
4287 age polluted waters; the well defined character of the
disease, taking everything into consideration, and also the substantially large percentage of deaths to those who have the cases, that is, the percentage of deaths to cases is larger than in some other instances. If Asiatic cholera should become established in this country I dare say that that might serve as an index to the sanitary character of water, substantially as well.

Q. Mr. Fuller, do you know how many people generally speaking, sicken and die of typhoid fever each year in the United States?

A. Some years ago I gave that matter careful consideration. Generally speaking I would place the number of typhoid deaths on a very conservative basis, as at from 25 to 30 thousand annually in this country. As to the number of cases occurring in this country annually, of typhoid fever, I would place the figure at more than a quarter of a million.

Q. Mr. Fuller, what in your judgment was the sanitary character of the municipal water supply of St. Louis, after having passed through the settling basins as delivered to the consumers, during the years 1895 to 1899, inclusive, and upon what do you base your conclusion?

A. It is my judgment that the water supplied to the citizens

of St. Louis by the municipal water department during the years 1895 to 1899 inclusive was what might be called a good sanitary water. I base that judgment upon this fact:
4288 during the period mentioned, the typhoid fever mortality statistics showed as low a rate approximately speaking, as in the case of quite a number of other American cities having a pure or very nearly pure water supply.

Q. Mr. Fuller, what treatment was given to the raw river water after its entrance into the intake tower at the chain of rocks and before its entrance into the service pipes of the consumers, in the city of St. Louis during the period from 1895 to 1899, inclusive, and how if at all, did that treatment affect the sanitary character of the water?

A. The treatment at that time, that is from 1895 to 1899 inclusive, consisted of settling the water in the basins at the chain of rocks, which process I have already outlined in its general features. The result of this settling was to improve the water to a considerable degree as regards the elimination both of mud and of bacteria, including those of a pathogenic nature when such were present in the raw river water.

I will add another thing, and say that there was substantially no change in the period for sedimentation during the years in question.

Q. I will get you to state Mr. Fuller, whether or not the term "pathogenic bacteria" is used by you to include waterborne bacteria that might convey infectious diseases such as cholera and typhoid?

4289 A. Yes sir.

Q. Mr. Fuller, what in your judgment was the sanitary character of the raw Mississippi river water as it entered the chain of rocks intake tower, St. Louis waterworks, during the years 1895 to 1899, inclusive?

A. It is my judgment that the raw Mississippi river water entering the intake tower during the period 1895 to 1899 inclusive, was a much less safe water from a sanitary standpoint than was the water after it had been treated in the settling basins, and delivered to the consumers. This was due of course to the elimination of bacteria of an injurious nature, by the process of sedimentation, and in which process the injurious bacteria subside—fall to the bottom of the basin and from time to time are removed from the basin and thus prevented from passing on with the water delivered to the consumers.

Q. How are the deposits made in the settling basins of the St. Louis waterworks removed, by the action of the water or by artificial means?

A. They are removed by artificial means; that is to say, once or more each year, the basins are emptied, and the mud is flushed by the aid of water, into channels, which conduct the mud to a sewer leading from the end of the basins to the river, and down below, a considerable distance below the
4290 intake tower.

Q. Mr. Fuller, referring to the sanitary character of the raw river water as it entered the chain of rocks intake tower during the years 1895 to 1899 inclusive, how would you classify that water as a city water supply?

A. I would classify it in its sanitary character, as a suspicious water, meaning by that not distinctly a good water, but one in which there was a liability of danger from time to time to those who drink it in its raw condition.

Q. Mr. Fuller, I will get you to state if you know how the typhoid fever statistics in the city of St. Louis for the period since January, 1900, compare with those of the five preceding years, and if so, state the comparison?

JUDGE JOHNS: I object to the question as the statistics themselves are the best evidence, and a comparison by the witness is not competent.

A. During the period from 1895 to the end of the year 1902, the number of deaths from typhoid fever each year was as follows:

	1895	106,
	1896	107,
	1897	125,
	1898	95
	1899	130,
	1900	168,
4291	1901	197,
	1902	222.

Averaging the number of deaths from typhoid fever during the five years, 1895 to 1899, inclusive, gives 112 deaths per annum from typhoid fever. The average annual deaths from typhoid fever during the three years beginning with January, 1900, is 196, showing an increase in round numbers in the number of deaths, of about 80 per cent.

Taking into consideration the differences in population, that is, the increase in population during that period, and expressing the typhoid fever deaths with reference to the number per 100,000 of population living, there has been an increase during the past three years on an average, of about 60 per cent over the annual typhoid fever death rate per 100,000 population living, for the five years 1895 to 1899 inclusive.

Comparing the number of deaths from typhoid fever during these eight years, with reference to the total number of deaths from all causes, occurring in the city of St. Louis, and obtaining the percentage mortality from typhoid fever, the percentage increase for the last three years on an average as compared with the average percentage of mortality from typhoid fever during the five preceding years, is 73 per cent.

I will further state that the average number of deaths from
typhoid fever in St. Louis during the first five years
4292 under consideration was about 20.4 per 1000,000 population living, and that this rate during the past three years, on an average, was about 32.3 on the same basis; that is, the average number of deaths per annum per 100,000 population living.

Q. Mr. Fuller, I will get you to state if in your judgment the three methods of investigating and comparing typhoid fever statistics afford, when considered together, a proper and reasonable basis upon which to base conclusions with reference to typhoid fever statistics of the city?

A. In my judgment that is true, for the reason that each throws light upon the matter, but the data regarding the two last methods of comparison taken together, are the fairest and best way.

Q. Now Mr. Fuller, I will get you to state speaking broadly, what in round numbers, considering all of these methods, and all of the facts, you consider the increase of typhoid in St. Louis to be, in the periods mentioned in the former question?

A. I should say in round numbers there has been an increase during the second period under consideration of about sixty to seventy per cent above the average rate in the earlier period mentioned.

Q. Mr. Fuller, I will ask you if you know how the typhoid fever statistics of the city of St. Louis for the period 4293 covered by the first five months of each year since 1895 to 1899 inclusive, compare with the first five months of the three years since January, 1900, if so, state what that comparison is?

A. The number of deaths from typhoid fever in St. Louis during the first five months of the years 1895 to 1899, show sums or amounts very much less than during the first five months of each of the years following 1899; that is, 1900, 1901, 1902 and 1903. This is particularly true of the present year, 1903.

Q. Do you know, Mr. Fuller, the mortality from typhoid fever for the five months of the year 1903 by months?

A. In January, 1903, there were 15 deaths,
In February, 1903, 15 deaths,
In March, 20 deaths,
In April, 17 deaths, and
In May up to date 18 deaths.

Q. These statistics are for the city of St. Louis are they Mr. Fuller?

A. City of St. Louis.

Q. Mr. Fuller, are you enabled by any methods of judgment of typhoid statistics, that you have mentioned, and from your general knowledge to say whether or not these figures for the year 1903 indicate an increase or a decrease of the typhoid fever in this city?

4294 A. They clearly indicate an increase in typhoid fever in this city.

Q. Mr. Fuller, I will get you to state if you know whether or not from the facts in your possession and the statistics that you have stated and are aware of, if typhoid fever shows any signs of abating in this city?

A. The record of the number of deaths from typhoid fever in the city of St. Louis by months, shows a continuance of these comparatively high figures to an unusual degree, showing that for this season of the year there is an unusual prevalence of this disease in this city.

Q. Mr. Fuller, I will get you to state to what cause you ascribe the increased mortality from typhoid fever in the city of St. Louis since January, 1900, and why?

A. I ascribe it to an increased amount of infection in the public water supply, and predicate this opinion upon the practically uniform distribution of the homes or residences in which the typhoid deaths have occurred in the city of St. Louis, and the further fact that a careful examination of the several other possible sources of typhoid fever shows that no substantial portion of this increase may be explained in that way.

Q. Mr. Fuller, what in your judgment has been the sanitary character of the public water supply of St. Louis 4295 after passing through the settling basins as delivered to the water consumers since January, 1900?

A. I consider that the sanitary character of the public water supply delivered to the consumers in the city of St. Louis has been less safe than it was formerly.

Q. Mr. Fuller, I will get you to state if, in your judgment, the water supply of St. Louis, as delivered to the consumers, after passing through the settling basins since January, 1900, can any longer be classed as a good water?

A. It is my judgment that it cannot be classed as a good water.

Q. Mr. Fuller, what has been the treatment of the raw river water after it leaves the chain of rocks, intake tower, and prior to its reaching the consumers in the city of St. Louis during the period since January, 1900, as compared with the five preceding years?

A. The treatment has been essentially the same.

Q. Mr. Fuller, what in your judgment has been the sanitary character of the raw Mississippi river water as it enters the chain of rocks intake tower, since January, 1900, and how does it compare with that of the five preceding years?

A. I consider that the sanitary character of the raw Mississippi river water entering the intake tower of the St. Louis

waterworks since January, 1900, has been distinctly and
4296 decidedly less safe than during the five preceding years.

Q. Mr. Fuller, generally speaking, what is the principal source of dangerous impurities in public water supplies in their raw condition?

A. Sewage pollution.

Q. Mr. Fuller, I will ask you if you are familiar with the relative amounts of typhoid fever prevailing on the area naturally tributary to the Mississippi river above the chain of rocks, for the five years preceding, and the three years since January, 1900, and what do you say as to the relation between the conditions in the sanitary character of the raw Mississippi river water at the chain of rocks intake tower and the prevalence of typhoid fever within the natural limits of the Mississippi watershed above St. Louis; that is, exclusive of the Chicago Sanitary District?

A. I am generally familiar with the typhoid fever statistics in the larger centers of population upon the Mississippi watershed, above the chain of rocks, intake tower of the St. Louis waterworks, and excluding the Chicago sanitary district during the periods mentioned in the question. During these periods there have been at quite a number of points, some variation in the amount of typhoid fever prevailing in different years. Taking the typhoid fever statistics upon this water-shed area
as stated, as a whole, but excluding the Sanitary Dis-
4297 trict of Chicago, based upon the average number of deaths
from typhoid fever per year, it is my judgment, viewing the matter as a general proposition, that there has not occurred on the natural area of the Mississippi watershed above St. Louis any increase in the number of deaths sufficient to explain to any material degree the less safe condition of the Mississippi river water as taken from the intake tower of the St. Louis waterworks, during the last period, as compared with the period 1895 to 1899.

Q. I will get you to state, Mr. Fuller, if you know of any cause that renders the water, if it is, less safe—that renders it so at the intake, at the chain of rocks now, and within the last three years, than prior to January, 1900?

A. In my judgment, it is the Chicago Drainage canal discharging sewage and drainage containing filth and infection, from the city of Chicago, which makes the water in its raw condition at the intake tower, chain of Rocks, St. Louis waterworks, less safe than it was preceding January, 1900.

Q. Mr. Fuller, when was the Chicago Drainage Canal opened?

A. January 17th, 1900.

Q. Mr. Fuller, will you please state briefly if you know, the object sought, and the means of accomplishing it, by the drainage canal, in relation to sanitation in the Chicago Sanitary District.

4298 MR. DRENNAN: I object to the question as not a proper subject matter for this witness.

GENERAL CROW: Is that all the objection?

MR. DRENNAN: Yes, the objection is one of substance.

A. The object primarily was to prevent the sewage from Chicago and the Sanitary District from reaching and polluting the municipal water supply of the city of Chicago. In carrying out this object there was provided a means for removing the sewage and drainage through the Chicago river by reversing its flow and having the sewage enter the Chicago drainage canal thus diverting it into the Mississippi valley. This method of removal so far as it relates to Chicago, involved dilution with the lake water to a degree which would prevent ordinarily a putrifaction of the sewage within the limits of the sanitary district. Incidentally of course, this method of disposing of the sewage meant an improvement and betterment of the sanitary conditions prevailing in the Chicago River and its several branches and forks.

Q. Mr. Fuller, I will get you to state if you know how many deaths from typhoid fever have occurred since January, 1900 in the city of Chicago, and what has been the disposition of the infectious discharges of the persons sick with this disease?

A. There have been about 1647 deaths from typhoid fever

4299 in Chicago since January, 1900, and the infectious discharges from the persons sick and dying of typhoid fever have to a very large degree been disposed of by their passage through the sewers to the Chicago river and the Chicago drainage canal.

Q. Mr. Fuller, I will get you to state whether or not you have made an estimate of the approximate number of persons sewering into the Mississippi river and its tributaries, exclusive of the Sanitary District of Chicago. If so, what figures have you obtained and upon what basis as to the separating of the rural from the sewage contributing population?

A. I have looked into this matter and in round numbers place the figure for those people who sewer directly into the Mississippi and its branches and tributaries above the St. Louis waterworks and exclusive of the Sanitary District, at about 2,700,000. This figure is based upon a separation, on an average of the sewage contributing population from the rural population by taking towns of 4,000 and over as representing those who have sewerage systems and contribute sewage directly to the water courses. Some of the towns of more than 4,000 population are undoubtedly not provided fully with sewerage facilities. On the other hand there are quite a number of towns of less than 4,000 population which in a limited measure do have waterworks, and do have some sewerage. Looking at this question as a practical proposition, it is my judgment that the
4300 amount of the sewage-contributing population in towns
of less than 4,000 inhabitants no more than off-sets in the aggregate the amount of population in the cities larger than 4,000 inhabitants which do not have sewers. It is a fact well known among practical waterworks and sewerage people that the number of miles of water mains in a town ordinarily exceeds to a considerable degree the number of miles of sewer lines. In making this statement as to the number of people in the aggregate sewering into the Mississippi river above the chain of rocks intake, I include of course, the Missouri river and the Illinois river, exclusive of the Chicago Sanitary District, as well as the upper Mississippi.

Q. Mr. Fuller, why did you draw a line at the towns of 4,000 inhabitants for the separation of population contributing pollution directly, from those which contribute indirectly?

A. Well, that matter I took up pretty thoroughly in the last answer I gave, and will state that the basis as described in my last answer is the result of my experience and I think that on the whole it is a reasonable and fair method due to its compensation of the two factors; first the amount of population in the cities above 4,000 which do not sewer directly into the river and secondly the population of some towns of less than 4,000 which do contribute sewage directly to the water courses.

4301 Q. Mr. Fuller, what would you estimate to be the percentage of increase in population sewering into the Mississippi river valley above St. Louis, due to the Chicago Drainage Canal bringing sewage of Chicago into the Mississippi river watershed?

A. In round numbers I estimate an increase of 60 per cent.

Q. Mr. Fuller, please state if you know, what course the diluted sewage follows, after the contents of the drainage canal, containing the filth and infection of the Chicago Sanitary district, after it flows from the Bear Trap Dam at Lockport and into the Desplaines river?

A. The contents of the Chicago drainage canal after entering the Desplaines river below the Bear Trap Dam at Lockport, flows along the course of the Desplaines River, which river joins the Kankakee and the two form the Illinois river. The contents of the drainage canal thence flow throughout the entire length of the Illinois river and enter the Mississippi at Grafton, which is distant about 291 miles from Lockport.

Q. Mr. Fuller, how long a time do you estimate is required for the Chicago sewage to flow this distance of 291 miles from Lockport to Grafton?

A. I place the figures ordinarily at from ten to twenty-five days. That range of course depends on the velocity
4302 of flow of water in the river.

Q. What would you estimate the average to be in time to make the flow from Lockport to Grafton?

A. It is my opinion that the average time required for the flow from Lockport to Grafton is about 15 to 18 days. In this connection I would further state that there are portions of the stream mainly the upper portions, which flow more rapidly than the lower portions, and some water presumably reaches Grafton quicker than indicated by the average above mentioned.

Q. Mr. Fuller, what in your judgment is the period of time which typhoid fever germs may and do continue to live in sewage polluted waters such as are found in streams, reservoirs and the like?

A. I consider that they may and do continue to live for weeks and months under those conditions.

Q. Mr. Fuller, what do you say as to the longevity of the germs of Asiatic cholera under the conditions mentioned in your last question?

A. The life history of the germs of Asiatic cholera under the conditions mentioned is less accurately known than in the case of the typhoid fever germs. Generally speaking, however
it is my opinion that there is not any very great difference
4303 in the life history of the germs of the two diseases, under
the conditions stated in the question.

Q. Mr. Fuller, in your judgment, what is the influence or effect upon the sewage discharged into the Desplaines river at Lockport, of the dilution which under existing conditions takes place in the Illinois river, viewing this question from the standpoint of a hygienic or sanitary character of the Illinois river water, as it enters the Mississippi river at Grafton?

A. The dilution of the Chicago sewage, as it flows from Lockport to Grafton, by the waters of the Illinois river and tributaries, is a very variable proposition. At times the dilution of the contents of the Chicago drainage canal by the flow of the Illinois river and its tributaries, is very considerable. At other times the volume of flow of the Chicago drainage canal exceeds the flow of the Illinois river, this being true particularly in its upper reaches. There consequently results at times a dilution of the Chicago sewage by the waters of the Illinois river, and other times a dilution of the Illinois river by the contents of the Chicago drainage canal. Dilution at best does not destroy disease germs or infectious matter. Its effect is to minimize the danger to those who may drink of the water so diluted. One
effect of the dilution existing in the Illinois river at low
4304 stages is to bring to Grafton more quickly than would
otherwise be the case, injurious matter entering the Illinois river at points along the route of its flow, and also entering the Illinois river from cities and towns located upon the tributaries to that river.

Q. Mr. Fuller, in your judgment, what is the significance of the ponds and of the dams and of the slack water stretches which are found on the Illinois river, regarding the hygienic or sanitary character of the diluted Chicago sewage flowing from Lockport to Grafton?

A. The most significant feature of these so-called lakes, dams and slack water stretches is the low velocity of flow of the water, at times of low stages of the Illinois river. There are a good many days in the course of a year when these velocities at the places above referred to are so low that deposition takes place to a considerable degree, of the bacteria and other matters suspended in the water, and which to a large degree are derived from the contents of the Chicago Drainage Canal. The deposition of these bacteria including those of infectious diseases like typhoid fever, does not mean their permanent elimination and removal from the flowing water. The reason of this is that as they reach the bottom and lie upon the bed of the stream they are disturbed from time to time, due to changes in velocity of stream flow, such as caused by
4305 moderate rains, or by the passage of boats or the action
of the wind and the like. The resulting disturbances cause the bacteria to leave the bed of the stream in which they may rest for some time, bringing about a return of those bacteria to the flowing water. In this way the germs of disease may pass from the Chicago drainage canal at Lockport to the mouth of the Illinois river at Grafton.

Q. Mr. Fuller, is it or is it not your opinion that typhoid fever germs disappearing from the flowing stream and becoming deposited in the bed, are able to live there for weeks or months?

A. I think that they are able to live for weeks and months.

Q. Mr. Fuller, I will get you to state if in your judgment it is possible, that the water of the Illinois river as it flows into the Mississippi may sometimes be richer in typhoid fever germs derived from the sanitary district of Chicago and coming through the drainage canal, than was that portion of the water drawn from the drainage canal when it flowed over the Bear Trap Dam?

A. In my judgment such a condition of affairs at times is not only possible but probable.

Q. Why?

A. Such a condition of affairs may arise and at times probably does arise through the disturbances of the sediment
4306 lying upon the bed of the stream in places, which sediment may and undoubtedly at times does contain relatively large numbers of typhoid fever germs. As these typhoid fever germs are returned to the flowing stream from their position in the bed of the river there is effected an accumulated result, whereby at times at least the waters of the Illinois river flowing to Grafton, may discharge the concentrated essence of the infection of Chicago sewage, by taking in the manner above described, portions of the infection coming from many days' flow of the drainage canal into the Illinois river.

Q. Mr. Fuller, I will get you to state if you know of any cases excepting storage reservoirs connected with public water supplies, in which sedimentation is employed for the purification of sewage or sewage polluted water without any provision having been made for the removal of the sedimented materials, so that these shall not find their way back to the flowing stream?

A. I know of no such instance, and it is obvious that if means are not provided for the removal of sedimented materials from time to time under proper conditions so that they will not re-enter the water as it leaves those basins, then the object and purpose of the settling basins largely fails.

ADJOURNED until 2:00 P. M., same day.

Southern Hotel, St. Louis, Missouri.
4307 2:00 P. M., Friday, May 29th, 1903.
Parties met pursuant to adjournment.

Present the Commissioner and same counsel representing the respective parties.

GEORGE W. FULLER,

resumed the stand for further direct-examination by Attorney General Crow, and testified as follows:

Q. Mr. Fuller, do you or do you not consider that all existing circumstances and conditions from Lockport to Grafton taken separately or together, are sufficient to prevent at all times the pollution and infection coming from the Chicago Sanitary District and entering the Mississippi valley at Lockport, from reaching the Mississippi river at Grafton?

A. I believe that those conditions are not sufficient to prevent at all times infected materials coming through the Chicago drainage canal and entering the Mississippi valley at Lockport, from reaching the Mississippi river at Grafton.

Q. Mr. Fuller, do you know how far it is from Grafton to the Chain of Rocks, water tower?

A. About 29 miles.

Q. Do you know how long a time is required for the Mississippi river to flow from Grafton to the chain of rocks?

A. It is a fraction of one day.

4308 Q. That is in the ordinary stage of water?

A. Yes sir.

Q. Mr. Fuller, is it or is it not possible, in your judgment, for the Illinois river water entering at Grafton the Mississippi River, which in turn is joined with the Missouri river six miles above the chain of rocks, to flow past the chain of rocks without some of the Illinois river water ordinarily entering the intake tower of the St. Louis waterworks?

A. I don't believe that it is possible for the Illinois river water to flow by the chain of rocks without some of it ordinarily entering the chain of rocks intake tower of the St. Louis waterworks.

Q. Mr. Fuller, in view of all the facts and conditions as you know them, do you or do you not consider that the sewage of the Chicago Sanitary District pollutes and infects the water of the Mississippi river along the Missouri shore, and especially at the chain of rocks intake tower of the St. Louis waterworks, to such an extent that it makes the Mississippi river water less safe for drinking and domestic purposes than it was before the opening of the drainage canal?

JUDGE JOHNS: I object to the question as requiring the witness to determine what is to be ascertained by the United States Supreme Court on the trial.

4309 A. It is my judgment that it does.

Q. Mr. Fuller, assuming that during the three years before and the three years after the opening of the Chicago drainage canal, the total number of typhoid fever deaths so far as can be learned, was about the same on the water-shed of the Mississippi river above the intake tower of the St. Louis waterworks at the chain of rocks, exclusive of the Sanitary District of Chicago, and that there were 337, 509 and 801 typhoid deaths in 1900, 1901 and 1902, respectively, making a total of 1,647 typhoid deaths for these three years in the city of Chicago, since the opening of said canal; state whether or not the said deaths in Chicago have in your judgment, had any influence on the typhoid fever mortality of the city of St. Louis, and if so, what?

JUDGE JOHNS: I object to that question for the same reason as to the foregoing question.

A. It is my judgment that under the conditions assumed in the question, the typhoid infection coming from Chicago and passing through the drainage canal by way of the Desplanes and the Illinois rivers to the Mississippi river and to the intake tower at the chain of rocks, of the St. Louis waterworks, did have an influence upon the typhoid fever death rate in the city of St. Louis, and that it is the cause of the principal portion of the increase during the past three years.

4310 Q. Mr. Fuller, assuming that the population of the sanitary district of Chicago grows larger, and that the amount of Lake Michigan water and of the sewage sent down the drainage canal and on into the Mississippi river under conditions corresponding in method of procedure to those which prevail today on the Desplaines and Illinois rivers, thereby increasing the amount of infected sewage entering the Mississippi watershed, what effect could such future growth of population in Chicago, and such future increase in added pollution to the Mississippi river waters, reasonably be expected to have upon the sanitary quality of the water of the Mississippi river in its raw condition, arriving on the shores of the State of Missouri below the mouth of the Illinois river and especially at the intake of the St. Louis waterworks at the chain of rocks?

A. Under the conditions assumed in the question it is my opinion that the water in the Mississippi river along the Missouri shore, especially at the chain of rocks, intake tower St.

Louis waterworks, in its raw condition, would be rendered less safe than at the present time, due to the increased amount of infection entering the Mississippi watershed, from Chicago and to the shorter interval of time required for the passage of that sewage from Chicago to the points considered, on the Missouri shore of the Mississippi river.

Q. Mr. Fuller, what effect, if any, in your judgment
4311 would the increasing amount of sewage from the sanitary
district, coming through the drainage canal into the Illinois river in future, caused by the growth of population in the sanitary district of Chicago, have upon the Illinois river and the Mississippi river at low water stages?

A. It would make it a much less safe water generally speaking, than at the present time, and it is quite possible that looking far enough into the future, that this amount of pollution would become sufficient to exceed the oxygen and to make it in many ways resemble an open sewer, that is to say, it will be a stagnant pool, resembling sewage rather than a live, natural water containing atmospheric oxygen.

Q. Mr. Fuller, I will get you to state if in your judgment the increased sewage coming into the Illinois river by way of the drainage canal and thence into the Mississippi, now, and in the future, would add any difficulties, or increase any cause to the problem of filtering or otherwise purifying the water of, and furnishing with safe water, the City of St. Louis?

A. In my judgment the increased amount of infection coming into the Mississippi river from the city of Chicago's sewage at the present time makes an added responsibility as regards the treatment of that water, to make it perfectly safe and wholesome as supplied to the citizens of St. Louis. Such treat-
4312 ment of the water would involve, I think at the present
time, more responsibility, and in a financial way, it would be shown by the greater expense of supervision of a filtration plant, and the added cost of supplies used in connection with the operation of filtration works, especially at times of low water. It would also mean that such filtration works, if adopted, would be operated from time to time, if not regularly, at lower rates of filtration than if this increased infection were absent. The significance of this is that by reducing the rate of filtration, that a

larger plant would be required, and hence a more expensive installation for filtration works, to purify the same quantity of water than in the instance of water without this added infectious matter.

Looking some distance into the future and considering the various centers of population naturally tributary to the Mississippi river at St. Louis, the Missouri and Illinois rivers, but excluding the Chicago Sanitary District, it is certain that there will ultimately come a time when single filtration can hardly be expected to produce a satisfactory quality of water with its source at the Chain of Rocks, intake tower. When that time will come it is difficult to state specifically, as it will depend upon the rate of growth of population in the communities situated upon the watershed of the Mississippi, Illinois and Missouri
4313 rivers, exclusive of the Sanitary District of Chicago.

Whatever the rate of growth may be in the communities situated upon the watershed of the Mississippi river above St. Louis, independent of the city of Chicago, it is certain that the added infection of the Mississippi water at the St. Louis intake due to the Chicago sewage, will hasten the day when single filtration at St. Louis will prove unsatisfactory, and when it will be necessary to give attention either to double filtration or to other methods, involving increased expense and increased responsibility.

CROSS-EXAMINATION by Judge Johns.

Q. Your opinions are all based on the assumption that the waters of the Illinois river are so polluted with the waters of the drainage canal as that they cannot purify themselves of infectious matter by the time they reach the intake at St. Louis, if they ever do?

A. That is true, but with the idea that that degree of purification can take place at certain times, not at all times.

Q. Are there any times in the Illinois river, or in the flow of the water from Bear Trap Dam to the intake at St. Louis, when that water would free itself of infection if any infection
4314 existed in it?

A. There may be and may not be; I don't know.

Q. Is there any season of the year in which it might happen?

A. I doubt it.

Q. Is there any rate of flow in which it might happen?

A. I doubt it.

Q. Is there any stage in which it might happen?

A. I doubt it.

Q. Well then, there is no time in which you do not doubt the purification of the waters of the Illinois before they arrive at the St. Louis intake?

A. Yes sir, that is right. The question of absolute removal at all times is the point that I have been giving most consideration to.

Q. You believe that infectious matter flowing from sewers in Chicago into the drainage canal will certainly arrive at the St. Louis intake at times?

A. At times, I certainly do.

Q. And in order to provide against that contingency some means of filtration or of the purification of the water should be adopted at St. Louis?

A. In order to get those particular germs out?

Q. Yes sir.

A. Yes.

4315 Q. If the city of St. Louis received its water supply only from the Missouri, it ought to be filtered, ought it not?

A. I think that would be desirable. It is not necessary in order to get a reasonably good water, as has been shown by the typhoid statistics and experience during 1895 to 1899.

Q. To have had a water supply which would meet the views of sanitary engineers at this time, the waters of the intake at St. Louis, if consisting only of Missouri water, ought always to have been treated by other means than sedimentation?

A. In order to get a thoroughly satisfactory water, without liability of possible pollution from time to time, that is true, but it is also true that before 1900, they got a reasonably good water without filtration but with the sedimentation.

Q. To what was the typhoid fever in St. Louis then attributable?

A. That is due to a variety of causes, such as may be classed in this way: There is a residual number of typhoid deaths in American cities which are not ordinarily eliminated even with a pure water supply and they are still found in a group of cities like Lowell and Lawrence, Massachusetts, and Albany, New York, which are now provided with good water supplies.

Q. If the waters at the St. Louis intake consisted entirely of Mississippi river water, without an admixture of the Illinois river water, it ought always to have been filtered, ought 4316 it not?

A. My reply would be the same as I have already given with regard to the Missouri water. I am of course referring now to the Mississippi exclusive of the Illinois in connectoin with the Chicago Sanitary District.

Q. So that if the Illinois river and the city of Chicago did not exist and the problem before the people of St. Louis now was what to do with their water, you think it ought to be treated?

A. In order to get a thoroughly satisfactory water, but as I have said, sedimentation from 1895 to 1899 gave them a reasonably good hygienic water.

Q. Did sedimentation from 1885 to 1895 give them a reasonably good water?

A. In my opinion I would hardly call that a reasonably good water at all times.

Q. Did sedimentation exist here before 1885?

A. Yes sir.

Q. For how many years?

A. Since about 1870, I should say.

Q. Do you know whether or not sedimentation from 1870 to 1885 gave the city of St. Louis reasonably good water?

4317 A. Judging from a sanitary standpoint I should be inclined somewhat to doubt that. I haven't those figures clearly in mind at the moment, as to typhoid fever statistics during the period which you mention, and prior to 1895.

Q. Now the opinions of sanitary engineers in their business have been constantly changing, and as you think constantly advancing for the last thirty years?

A. Well, I won't say within thirty years, although to a degree that may be so. It is more particularly so since the germ theory of disease became recognized.

Q. When was that generally recognized first?

A. Well, from fifteen to eighteen years ago, I should say. That period would apply not to the sanitary engineers as a profession, but to those who had traveled abroad and who were better posted with experiences in Europe.

Q. When did the germ theory of disease become generally recognized in the United States among sanitary engineers so far as you know?

A. It was in the late eighties. I couldn't state that specifically. They have been learning all the while, and are still learning.

Q. And except to continue to learn?

A. Very likely; I hope so.

Q. So that in twenty years from now all present theories 4318 will be abandoned?

A. I have no reason to suppose that.

Q. Well, looking into the future don't you think that present theories might be abandoned?

A. I have no reason to believe that the fundamental principles upon which sanitary engineering is based, are apt to change to any essential degree. In applying those principles with a view of securing thoroughly satisfactory water supplies, as to quality in different places, we would have to recognize the individuality of local conditions in adapting the application of those principles to practice.

Q. Looking into the future, it might be possible that the practice of filtration would have to be abandoned, might it not, and sewage destroyed at its origin?

A. There is a possibility that that may be a condition in the future.

Q. Looking into the future it is possible in low water that the Missouri river might become a stream of liquid sewage?

A. Well, that would be a long way off, as to its being liquid sewage; it would be very highly sewage polluted no doubt.

Q. Looking into the future, no matter how distant, it is possible that the Mississippi river might become either a stream of liquid sewage, or a highly polluted water at times of 4319 low water?

A. Yes sir.

Q. And that the Illinois river might become a stench to the nostrils of the people?

A. It is possible it might be so, yes.

Q. In which case quadruple filtration might be necessary if the city of St. Louis persisted in taking its water from these rivers?

A. There is a possibility of that, but as I have stated, it is also possible that other types of purification may be required in connection with filtration. Also as stated in my examination in chief, the city of Chicago's sewage will very much hasten that day, whenever it may come.

JUDGE JOHNS: I move to strike out the latter part of the answer as not responsive to the question.

Q. You believe that typhoid bacilli entering the drainage canal at Chicago not only may be, but are transmitted to the intake at St. Louis?

A. I do.

Q. And that belief exceeds by more than 210 miles any distance in which it is either known or supposed heretofore that typhoid bacilli have traveled in running water and lived?

A. No sir, those are not my views in the matter. It is a question of time interval, not of distance, which is the 4320 controlling factor in this proposition.

Q. The question of distance then doesn't enter into it at all?

A. So far as it reduces the time interval it does.

Q. Given sufficient distance and sufficient time, typhoid bacilli might disappear, or would disappear from running water, would they?

A. You mean that proposition independent of dilution?

Q. Yes.

A. And just the natural dying out?

Q. Yes sir.

A. There would be a very large reduction ultimately. Whether typhoid fever germs would be eliminated, wiped off the face of the earth in that way, it seems to me is very doubtful.

Q. Given a stream of water of 300,000 cubic feet a minute, into which the sewage of Chicago was poured, would there be any length of time, or any distance which would free that stream of typhoid infection?

A. By looking at it practically, I think it is very doubtful. Of course I am not considering any distances which are absolutely impossible.

Q. If a stream of water of 300,000 cubic feet per minute, into which was poured the sewage of Chicago, was started in a tortuous course of a small river at Bear Trap Dam, and received no dilution on the way, do you think it would purify itself by the time it reached New Orleans?

4321 A. I do not believe it would be absolutely freed of infection. There would be a very great reduction though, in the number of typhoid germs present.

Q. You do not believe that there is any length of time or any conceivable distance for a stream of sewage to travel and in which time it will absolutely purify itself of infection?

A. Taking that as an absolute proposition, I think it is very doubtful.

Q. Do you believe that if the sewage of Chicago was poured into the Mississippi river at St. Paul, it would purify itself by the time it got to St. Louis?

A. It would to a large degree, but I don't think it would be absolutely purified.

Q. If poured into the Mississippi river at St. Paul would it be dangerous to the people taking water at St. Louis at the intake?

A. It would in the sense that the liability of trouble would always exist to my thought.

Q. So that there is absolutely no such thing as the purification of a stream of running water into which infection is poured from sewage?

A. Absolutely speaking, I think that is a very doubtful proposition.

4322 Q. And if it was doubtful whether it would purify itself under any length of time or any distance, or any amount of dilution, the water ought to be filtered before used in human consumption?

A. In order to be absolutely safe, I think that that is true.

Q. Do you recognize degrees in the safety of water for drinking purposes, as for instance, safe, safer and safest?

A. I use them, yes sir, as a matter of convenience, but not as a fixed, prescribed means of nomenclature.

Q. If there were typhoid bacilli in the Missouri river and the water supply of St. Louis was taken from the Missouri river only, there ought to be filtration or some treatment of that water?

A. I should advise it.

Q. If there were typhoid bacilli in the waters of the Mississippi and the Missouri and the water supply of St. Louis was taken from those two streams, without the intermixture of the Illinois river water, it still ought to be filtered?

A. In my judgment that is correct.

Q. What proportion of the entire body of water passing the Chain of Rocks is Illinois river water?

A. That is a very variable and somewhat uncertain proposition when expressed in precise terms. It no doubt is quite an appreciable quantity at all times, but at times of low 4323 water in the Missouri and at times of high water in the Illinois, it must be a very distinct and decided proportion.

Q. Have you any idea of the average proportion?

A. No, I don't think that I would express any figure off hand.

Q. Would you say that it was as much on an average as one-twenty-fifth of the entire body of water that passes the intake?

A. I should think that very likely it would be more than that.

Q. One-twentieth?

A. Well, it is somewhere around that vicinity. I haven't any definite statement to make on that proposition.

Q. Now is there any peculiar arrangement of modern filters by which there can be provision made for filtering out infectious matter as distinguished from polluting matter?

A. In a certain sense, there is not.

Q. If you were going to build a filter with reference to the waters of the Missouri river, assuming that the Missouri river was not infected, but was polluted, would you build it any differently or on any different plan than if you were building the filter against the Missouri river waters, assuming that they were both infected and polluted?

A. I don't think there would be any material change re-
4324 garding a certain unit portion of it, but as the pollution
and infection increased there would be a larger area required in order satisfactorily to purify the infected water.

Q. If you were providing a filter now against Missouri river water only, would you make it larger and more elaborate because of its present condition of infection?

A. Not under the present conditions, no sir.

Q. If you were providing a filter against the Mississippi river water only, without reference to the Illinois river, would you make it larger or more expensive because of its present state of contamination?

A. Not to any material degree so far as its construction is concerned. At the present time it would be a question of the cost of operation principally.

Q. If you were providing for a filter against Missouri and Mississippi river water without an admixture of the Illinois river water, and to supply a certain amount of filtered water, would you make it larger or more expensive because of the union of these two waters, the Illinois being excluded?

A. Excluding the Illinois, I would not.

Q. Would you make it larger and more expensive in its construction if the Illinois river were also included, at the intake at St. Louis?

A. The way that would probably come about in prac-
4325 tice is that there would be no very marked difference in
the size of the first installation; but the reserve portion of that first installation would serve for a shorter period of years, due to the presence of the Illinois river water and its pollution, than would be the case without that water.

Q. That is due to the supposed increased pollution of the Illinois river water?

A. To existing pollution of the Illinois river water.

Q. Of the existing pollution of the Illinois river water?

A. Yes sir.

Q. Well, if you are going to manage a filter, you ought to have pretty good men to do it, oughtn't you?

A. That is true as a general proposition, yes sir.

Q. And when you are going to filter the water for any purpose you ought to do it the best you know how, having regard to the health of the people who are to drink it?

A. Well, there is a good deal in that, but ordinarily a water which can be easily handled by filtration, and where the possibility of a slight deterioration in the quality is not a serious matter, it is very seldom in practice that the expense of the organization would be so great, as it would be in the instance where the unfiltered water is of such a character that serious harm might result from a slight deterioration, or from a serious marked deterioration for a short period.

4326 Q. The operation of filtration of water in any way now known is purely mechanical, is it not?

A. In what sense do you use the word "mechanical" if I may ask?

Q. I mean that the actual act of the filtering of the water does not depend upon the deftness or skill of any human being around the works?

A. It depends in the case of these southern and western waters very much upon the skill with which the coagulant is adjusted, in order to secure proper results.

Q. In the filtration of waters now, is it necessary to always add coagulants?

A. It is at this city as a practical proposition.

Q. For cities?

A. For the water supply of this city at St. Louis intake tower, or the Missouri river, that is true.

Q. The adding of a coagulant, alum for instance, is necessary?

A. It is imperative in order to get results here at a practicable cost.

Q. There is required some skill and judgment in the man who manipulates the coagulant?

A. Some skill, yes sir.

Q. And some judgment?

A. And some judgment.

Q. Well, would it require any more skill and judgment to 4327 add the coagulant to the filtration of the combined waters of the Mississippi and the Missouri, excluding the Illinois?

A. Yes sir, very much more, because they are entirely different waters in character; one is muddy water and the other is a water with a vegetable stain.

Q. Would it require any greater judgment to filter a mixture—an equal mixture of the waters of the Missouri and the Mississippi, excluding the Illinois, than to filter the waters of the Mississippi, so far as the coagulant is concerned?

MR. JEFFRIES: Do I understand that to mean an equal mixture at all times?

JUDGE JOHNS: Oh, any time.

A. I think it would.

Q. And require still more sense to filter the waters of the three rivers combined, as they are now, than to filter the waters of either the Mississippi or the Missouri, or the two combined?

A. I think so, yes.

Q. The additional expense therefore, would be for the paying of the increased amount to the men who had sense enough to do it?

A. And to the members of his staff who would take that responsibility in detail, through the 24 hours of each day 4328 and each day in the week and each day in the year.

Q. What system of filtration do you recommend?

A. It depends altogether upon local conditions.

Q. What system of filtration would you recommend here at St. Louis?

A. I endorsed a project involving the use of the mechanical filters following sedimentation of the river water, and then coagulation and supplementary subsidence, there being three steps; the first, plain sedimentation; the second, coagulation and supplementary subsidence; and the third, mechanical filtration.

Q. Do you recommend, then, that this mechanical filtration should be by gravity or by pressure?

A. By gravity.

4329 CROSS-EXAMINATION, By Mr. Todd.

Q. Mr. Fuller, in the operation of a filter plant such as you have described, for the filtration of the waters of the Illinois, the waters of the Missouri and the Mississippi, exclusive of the waters of the Illinois, sufficient to meet the demands of the citizens of St. Louis, how many men would be required to operate such a plant?

A. I doubt whether I could tell you that very accurately off-hand. It is a matter that has been reported upon, with the cost of the same, after having been given careful consideration. If it is essential I will try and figure it out for you.

Q. Assume in round numbers that 20 men could operate such a plant for the filtration of the waters of the Mississippi and Missouri river to meet the demands of the citizens of St. Louis, in the employment of those men would you require the services of less able men to conduct a filter of that character than you would if the filter filtered in addition to the waters of the Missouri and the Mississippi, the waters of the Illinois?

A. I won't place it on the basis of the ability, but I will say their experience, unless you mean by ability, practical capacity, I will say then that there should be more experienced and more able men operating the filters here at St. Louis
4330 should the Illinois river water, containing its infection, become a factor.

Q. How many of those 20 men would be required to possess that high degree of skill necessary to conduct the plant operating for that purpose?

A. I suppose somewhere from four to six, speaking off hand now. There would be the man in charge of the plant and the members of his staff, who would be on each of the three watches per day. That is my general view of that matter.

Q. Now the man at the head of the plant, the executive officer of the plant, if I may call him such, would have to be a man of just as skilled abilities and intelligence to operate that plant for the filtration of the waters of the Mississippi and the Missouri as he would have to be if the Illinois river was added, wouldn't he?

A. No, I hardly think so.

Q. Would you recommend in the conduct of a plant such as we have described, the employment of a man to superintend a filter plant of the character we have described, when the waters to be filtered consisted of those of the Mississippi and the Missouri, less skilled and able than when the waters of the Illinois were added?

A. Well, a less experienced man would serve the purpose in managing the plant where the Illinois river was ex-
4331 cluded, and this pollution which it carries.

Q. Do you regard experience as the chief element in the qualification of such a man?

A. I would regard experience in conjunction with natural ability and good sense, assuming that the man in charge would have those. I think that is imperative.

Q. Have you any idea as to what the difference in cost would be in the employment of a man of sufficient skill to operate a plant under the former supposition than under the latter?

A. This is the man in charge, and the present time you are considering?

Q. I am talking about the present time now, and later we will dip into the future?

A. I should think it would be several thousand dollars, but I wouldn't want to state that specifically. I don't know the amount of talent which is available in this section.

Q. What would be the cost or amount to operate such a plant as that filtering the waters of the Mississippi and the Missouri rivers?

A. I am afraid I cannot dictate the terms of compensation for those men.

Q. Have you any idea about it?

A. I should think between the limits of $2,500 and $5,000 a year; I don't know exactly.

4332 Q. Aren't there men of sufficient skill to operate a plant of that kind, filtering the waters of the three combined rivers, that could be secured for less than $5,000 a year?

A. I wouldn't want the responsibility of what they would do in the line of managing the plant, without knowing about them.

Q. Do you know of any man in the United States today that operates a filter such as would be operated here, in filtering the waters of the Illinois, Mississippi and Missouri rivers?

A. I am not personally acquainted with such a man.

Q. Do you know of any conditions existing in the United States or elsewhere, similar to those existing in St. Louis, and would exist if a filtering plant was established, such as you have indicated, to filter the combined waters of those three rivers?

A. I do not know of anything exactly parallel, no sir.

Q. Then, if there is no such parallel to be found, where will the experience come from that will enable a man of that kind to be secured, having the ability to perform the work?

A. It will be necessary to get a man who has had the advantage of the experience in the development of the science and art of water filtration as it stands today.

Q. Now, securing such a man, would you say that such a man could be secured for $5,000 a year?

4333 A. I really don't know.

Q. Assuming that such a man could be secured who possessed the requisite ability to conduct a plant of that character, wouldn't that man be able to direct the administration of that plant with subordinates not quite so experienced as himself?

A. I don't know, I am sure. There is a possibility of it, but I really don't know.

Q. Then you have no knowledge based upon experience, that would enable you to state as a business man and expert, as to what the added cost of operating such a plant would be if the waters of the Illinois were added to the waters of the Mississippi rivers, have you?

A. Now you are considering not only the question of the executive management, but the cost of the station and all the supplies, and everything in connection with the plant?

Q. We are first taking the management, the man part of the concern.

A. That is, the executive head.

Q. The executive head.

A. Why, it would amount to several thousand dollars a year; I cannot place a close figure on that; it is appreciable and distinct in my opinion.

Q. Is this a matter that rests in opinion, or is it a matter that can be suitably demonstrated or measured in dollars and cents? 4334

A. It can be, approximately in dollars and cents, but I have not considered it in detail to give any more close figures than I have already stated.

Q. What in general would be the added expense of such a plant, covering the waters of the Illinois, the Mississippi and Missouri, over a plant filtering the waters of the Mississippi and the Missouri?

A. Still considering the executive head?

Q. Taking the whole matter, and we will separate it afterwards.

A. That is under present conditions?

Q. Yes, under present conditions.

A. I haven't made any close figures on that. I should think it would amount to quite a number of thousand dollars each year.

Q. Well, how many?

A. It is a mere guess which I would give; perhaps $20,000 or $25,000 for an off-hand opinion.

Q. Do you feel that you are competent to pass an opinion on the proposition?

A. If I were asked to figure it out in detail and make such a report, I think I am competent.

Q. I mean at present, Mr. Fuller?

4335 A. I can give you an off-hand opinion, as I am doing.

Q. Do you attach much value to that opinion?

A. As a general guide to the truth, I do.

Q. Is that opinion made from any knowledge of the details of expense of operating a plant?

A. Yes sir.

Q. What would be the added figure of the help of such a plant operating for the filtration of the waters of the Mississippi and Missouri, and the same plant with the Illinois added?

A. I have already stated that to be several thousand dollars. I cannot prescribe salaries.

Q. How do you arrive at several thousand dollars?

A. On the basis that it takes more experienced men to operate a filter plant where the quality of water is more dangerous, and where there are added supplies and responsibility, in the management.

Q. Would it require skilled men to operate a plant to filter the waters of the Missouri and the Mississippi?

A. It would require skilled men, yes.

Q. Would you recommend a less skilled man for the filtration of those waters than you would if the Illinois was added?

A. Yes, that is, experience and skill, combining the two.

Q. Yes.

A. Yes sir.

4336 Q. Under present conditions, what percentage of Illinois river water enters the St. Louis intake throughout the year?

A. I don't know accurately on an average. It varies very much no doubt.

Q. Have you any idea?

A. Do you mean for the average?

Q. An average per cent assuming that the waters at the intake represent 100 per cent and the 100 per cent is made up of Missouri river water, Mississippi river water and Illinois river water, what the average per cent throughout the year is of Illinois river water?

A. I couldn't tell you that very accurately.

Q. Then wouldn't the additional cost of a plant of that kind depend very largely upon the percentage of Illinois river that enters into the mixture of Missouri and Mississippi River water entering the intake?

A. As a practical proposition it would not depend upon the average per cent, but the maximum percentage of the amount of Illinois river water, highly polluted, which might from time to time reach the intake.

Q. Do you know as a matter of fact whether the conditions do not exist at the St. Louis intake, wherein the waters of the Missouri and the Mississippi are more infectious at times than the water from the Illinois?

4337 A. I do not know accurately about that. I think there may be some day in the course of a year when that might be possible.

Q. Do you think it is possible there are days during the course of a year when the water supply of St. Louis comes exclusively from the Missouri river and not from the Mississippi and Illinois?

A. No, I don't think that.

Q. Do you think there are days in the year when the waters at the intake come from the Missouri and Mississippi and not the Illinois?

A. No, I think there is some Illinois river water at all times.

Q. At all times?

A. Yes sir.

Q. When the Mississippi is low and the Illinois is low and the Missouri river high, would that condition obtain?

A. Yes, but of course there are times when the Illinois would be small in percentage with the Missouri high and the Mississippi and Illinois low.

Q. Do you know how often during the year the percentages of Missouri river water and Mississippi river water are greatly in excess of the Illinois river water, taking it at the St. Louis intake?

4338 A. A good many days, I presume, when the Missouri and the Mississippi are larger than the Illinois.

Q. Don't you think that the general average for the year would show a smaller per centage of Illinois river water than the Missouri and the Mississippi river water combined in the St. Louis intake?

A. Yes sir, a smaller percentage of Illinois.

Q. If it is true as an average, what additional skill would be required to operate a plant where the percentage of Illinois river water was much smaller than that from the Missouri and Mississippi?

A. To guard against danger arising on those occasions when a considerable amount of infection comes from the Illinois river water, and such as would produce a dangerous water at the intake of the St. Louis waterworks, independent of the infection and danger which might possibly come from the Missouri and Mississippi water.

Q. Is there anything known to sanitary science or any method known to sanitary science when those times can be accurately ascertained?

A. Not definitely, and that is the very reason why skill and experience are required, in the operation of that plant, to a greater degree with the Illinois river water, than without it.

4339 Q. Aren't there times and can't you conceive of times when the sewage discharge from Kansas City would be a great menace to the public health of the city of St. Louis?

A. Are you looking into the future now, sir?

Q. Either the present or the future?

A. I can conceive of such a condition taking the water in its raw condition.

Q. When such a time should arrive and such a time might arrive, might it not at no great distant future?

A. There is a possibility of it.

Q. If there should be an epidemic break out in Kansas City, wouldn't that be a menace to the water supply of St. Louis?

A. To a certain degree it would.

Q. Do you know how long it takes the sewage from Kansas City to come to the intake of the St. Louis water supply?

A. I have made estimates on all those things. I can get them if you wish to know.

Q. I would like to have an estimate on that if you can get it.

A. Under the average conditions it would be in the neighborhood of a week.

Q. Assuming that in Kansas City there should be an epidemic of typhoid fever, and the filter system such as you would construct for the filtration of the Missouri and Mississippi 4340 river waters was operated by a less skillful crew than would be established there when the combined waters of the Illinois and Mississippi rivers would be filtered, would the filters be a protection to the public health of the city of St. Louis under those conditions so operated?

A. I should hope so. I think they would.

Q. Then if the crew that you have mentioned would be able to compete with the epidemic at Kansas City within seven days journey from the waterworks of St. Louis, why couldn't that same crew protect the city water supply when filtering the waters of the Illinois?

A. It is possible that they might, but there would be the added danger from the Illinois water in that is intermittently flushing out large accumulations of sediment making the water here much more dangerous than it would in connection with the Kansas City epidemic.

Q. When you look into the future, you have no pessimistic views about the growth of Kansas City, have you?

A. No sir.

Q. With its near proximity to St. Louis in point of time, and the possibilities of it getting a typhoid contagion, isn't it a danger and a menace, present and impending to the water supply of the city of St. Louis?

A. As a general proposition I think it is.

Q. Would the closing of the drainage canal and the shut-
4341 ting off of its sewage preclude the future pending and impending dangers to the water system of St. Louis as it is at present established and preclude the probability of typhoid fever infection, or the danger from typhoid fever infection?

GENERAL CROW: Object to the question because it is wholly immaterial in this case as not tending to prove or disprove any issue that may be involved herein.

A. It would render much more distant the day when serious trouble would result from the use of the water taken from the present intake tower and treated in the manner as it is treated at the present time and as it was treated during the period of 1895 to 1899, and when the typhoid fever death rate in the city of St. Louis was such as to enable that water so delivered to the citizens of St. Louis, to be fairly called a good sanitary water.

Q. In considering the present, do you consider the waters of the Missouri river as a safe and usable water?

A. In a raw condition?

Q. In their present condition, in their raw condition?

A. No sir, I do not consider that the water in the Missouri river at the present time a fairly safe water.

Q. With the treatment that it receives with the water system existing here in St. Louis, would you pronounce it as safe and usable water?

MR. JEFRIES: At the present time or prior to 1899?

4342 Q. At the present time? It has been admitted here that the conditions of today have existed for ten years.

A. I shouldn't say so in absolute terms, but practically speaking and based on the experiences from 1895 to 1899, I would say that it would be reasonably safe.

Q. And based on the experience prior to that time?

A. Well, that I couldn't state.

Q. Would you consider a water such as the Missouri, with a town located within seven days of its water supply, where the number of typhoid deaths such as existed in Kansas City from 1893 to 1899, a safe water, after it has been subjected to the conditions existing here in St. Louis?

A. I don't think it would be absolutely safe, but practically speaking I think it would be reasonably safe, as judged by what was the actual experience in this city from 1895 to 1899. I don't know the conditions prior to 1895, at least I haven't them in mind.

Q. Do you consider a filter plant such as we have talked about, absolutely safe?

A. Practically speaking I do, but there is no such thing as an absolutely germ proof filter on a large scale, though.

Q. Then if there is no such thing as absolutely pure,

4343 we will eliminate that term and apply a practical term.

Would you consider the waters of the Missouri with the typhoid conditions existing from 1893 to 1899 along the watershed of the Missouri river as safe a water for drinking purposes, as treated by the St. Louis water system, assuming that the same conditions existed then as exist now?

A. That is, typhoid at Kansas City, and the settling of the water at the chain of rocks intake tower?

Q. Also Council Bluffs, and Omaha, Lincoln, Nebraska and the other towns?

A. I should say that the water would not be absolutely safe water after having been treated in the chain of rocks settling basins. But from a practical experience, under the conditions such as did obtain, I think it would be still a reasonably good water, a reasonably safe water.

Q. Eliminating the question of absolute purity, would you consider the waters of the Missouri, after that period, so treated, as a safe drinking water for the people of St. Louis?

A. I should say reasonably safe, as I have said in each instance, based on practical experience where they had not only the sewage and typhoid infection of the Missouri river towns which you have mentioned, but also of the upper Mississippi during the period from 1895 to 1899.

4344 Q. Assuming that you occupied the position of sanitary engineer in St. Louis, that there was no typhoid fever in the city and that a plant such as the plant now installed here was just established, and conditions existed along the Missouri river such as you are acquainted with as having been proven here, and the water supply for the city was to be taken from the Missouri river, would you as such sanitary engineer, recommend the water so treated, as a safe water for drinking purposes?

A. I should probably recommend that they adopt filtration in connection with it, but if those funds were not available, and I was asked if sedimentation without filtration wouldn't do for that water, and whether it wouldn't be reasonably safe or good decent water, as water supplies go in this country, I should say "Yes." That is my general view.

Q. Assuming that same question, with the water here being taken from the Missouri and the Mississippi river and all the conditions from 1893 to 1899 that existed upon the watershed of the Mississippi above Grafton, and the Missouri river, existed, excluding the Illinois, up to 1899, would you then pronounce the water so treated, as a safe water?

A. I should still think it would be a reasonably safe water, yes sir; not absolutely but reasonably so.

4345 Q. Well, we will eliminate the absolutely, as I believe you have stated there was no absolutely pure water used by cities, did you not?

A. I stated that there are no filters which are absolutely germ proof at all times.

Q. Yes, that's what I mean at all times.

A. There is a comparative degree which always obtains there.

Q. Assuming that the water supply came from the Missouri, the Mississippi and the Illinois, excluding the sewage that comes from the drainage canal under similar conditions, as contained in the previous two questions, what would you say then as to the water being safe and usable?

A. I should still think it would be safe and usable with the sedimentation which takes place in the manner similar to that actually provided at the chain of rocks.

Q. During the years prior to 1899, do you consider that the sewage pumped into the Illinois and Michigan Canal by the Bridgeport Pumping Works and thence entering the Desplaines river, as an infected sewage?

A. I think that the sewage pumped into the Illinois and Michigan Canal prior to 1899, contained infection, in a considerable proportion. A large proportion I may say, of the infection coming from the Chicago sewage remained on the Chicago side of the Bridgeport pumping station, where it was
4346 present with the sediment which remained undelivered by
the pumps into that canal.

GENERAL CROW: Remained where?

A. Remained undelivered through the pumps, that is, in the Chicago river. I also believe that the contents of the Chicago canal pumped into the Illinois and Michigan Canal were in such a state of advanced decomposition that the proportion of typhoid fever germs originally present in that liquid was comparatively small, particularly as the contents of that canal flowed into the Desplaines river.

Q. When any sewage is pumped into the Illinois and Michigan canal and then emptied into the Desplaines river, do you hold that it was free from any infectious germs dangerous to the city of St. Louis?

A. Not absolutely, no.

Q. In what degree?

A. I can measure that practically only in connection with all of the existing infection during the period from 1895 to 1899 which reached the chain of rocks intake tower of the St. Louis water works, meaning by that all of the infection coming from the Missouri, the upper Mississippi, from the Illinois and including such portion as came from the Illinois and Michigan Canal. Taking all those together there resulted a water polluted to a certain degree of course, at the intake tower of the St. 4347 Louis waterworks, but which degree of pollution was not such but that the sedimentation protected the citizens of St. Louis from any serious trouble from typhoid so far as the public water was concerned.

Q. If a considerable portion of that sewage was infected and once got into the Desplaines river, the typhoid infection would lie there in the sediment for a considerable portion of time wouldn't it?

A. It might, but I don't think that infection would get into the Desplaines river to any large degree because of this septic action, which, owing to the very nature of the process means a very tremendous growth of certain kinds of bacteria, the action of which is known to have a destructive influence upon the germs of typhoid fever.

Q. If in the watershed exclusive of Chicago, of the Illinois, Mississippi and Missouri rivers for the year 1897, there should be 374 deaths from typhoid fever and as high as 148 in the city of Minneapolis, will you explain why, with this typhoid condition existing for that year, that the St. Louis water supply was not menaced?

A. In its raw condition it was to a certain degree. It was not absolutely free from infection and the liability of infection, but that degree of infection was not such but that the sedimentation which the city waterworks provided could protect 4348 reasonably the water consumers in the city of St. Louis.

Q. How long would it take typhoid infected water, placed in a sediment basin to settle, so as to make the water safe?

A. With a water which is very seriously infected with typhoid matter, I think it is extremely doubtful if not certain, that it would never be entirely freed from that infection by sedimentation.

Q. Do you know how many typhoid bacilli are contained in the dejecta of one typhoid patient during the period of 24 hours?

A. No sir, I haven't any recollection of any such information.

Q. Assuming that there are two hundred thousand millions of typhoid bacilli discharged from a typhoid patient in 24 hours, and that there were in the watershed of the Missouri river, figuring that for every death there were ten cases, 3,740 cases, and that the average life of a typhoid case would be about fourteen days, if that number of bacteria as counted, represented by carrying out the calculation, was dumped into the watershed of the Mississippi river above its intake, including by that the Mississippi, the Missouri and the Illinois during the period of a year, and distributed as the time shows, wouldn't that be enough microbes, parasites or germs, as the case may be, to pollute the water of the Mississippi?

A. It would pollute it somewhat, no doubt; it would be
4349 bound to.

Q. How long would that water thus polluted, placed in a sediment basin, be, before it would become pure, safe and usable?

A. I don't think anyone can answer that very specifically, but it would be a very much longer period than almost anyone would be inclined to think, and I base that opinion on the fact that sedimentation basins holding thirty days' supply, are not able, uniformly, to protect water consumers in instances where the waters entering such settling basins are sewage polluted and infected. There would be a very large removal, though it would not be an absolute removal.

Q. Do you know how long water that is placed in sediment basins of St. Louis, remains there before being taken out?

A. It is a question of several days.

Q. Is it not a fact that the settling basins in St. Louis are emptied every three days or less?

A. For what purpose, sir?

Q. For consumption?

A. That was their style of operation in the early years, but not at present.

Q. How long does the water stand today in the settling basins from the time it is pumped into the settling basins to the time it is given to the consumer?

A. That is a very variable matter, depending upon the
4350 rate of consumption, but taking the average consumption we will say, for the year, there are approximately 65,000,000 gallons of water used here in St. Louis on an average, per day. Those six basins at the chain of rocks hold 174,000,000 gallons, so that there would be between two and three days storage or period of sedimentation in those basins provided none of them were out of service for cleaning.

Q. In those sediment basins are the waters in a perfectly quiescent state for a period of three days at a time?

A. No.

Q. Two days?

A. It never gets absolutely quiescent. That is impossible in large bodies of water.

Q. There is always great turmoil in those settling basins, isn't there?

A. There is some movement to the water.

Q. How much of a movement would you calculate?

A. I should think it would be less than a foot per minute as I remember it. I am speaking off hand.

Q. How much would that be in miles per hour?

A. It would be a great deal less than one-third of a mile per day.

Q. One mile in three hours?

A. It would be less than that.

4351 Q. Would it be as much as one mile in four hours?

A. It is less than that a good deal, at the chain of rocks.

Q. During the time that the waters are in the settling basins, is that water quiescent so as to have complete sedimentation?

A. It approaches quiescence, but it doesn't reach it. Sedimentation takes place to a large degree, but it is very seldom that all the matters in suspension are entirely eliminated.

Q. And if that water should have a few million typhoid bacteria in it, the time that it is in the settling basin wouldn't be sufficient to eliminate them, would it?

A. Not if all those typhoid fever germs we are talking about up the several rivers continued to live and reach the intake tower of the St. Louis waterworks.

Q. Is there anyway of ascertaining how long they will live?

A. An opinion can be formed on the period which some of them may live.

Q. Can an opinion be formed except it is based on a theory?

A. Yes, I think it can.

Q. Has it ever been demonstrated how long a typhoid germ will live in running water, except based upon assumptions; I mean, water running in a river? Suppose it was possible 4352 to pick out 50 typhoid germs and put them into a running river, has anyone ever been able to say how long those germs would live?

A. Not from laboratory experiments; but it is possible by actual information as to the pollution of the water supply of one city on a large river, by the sewage of another large city, some distance above the first mentioned one, to demonstrate that. There are quite a number of instances available as to that practical information which may be obtained.

Q. But it is not a scientific demonstration, is it?

A. I should consider it so, because it is a truthful one.

Q. It is as infallible, is it, and as accurately demonstrated as twice two is four?

A. I think it is, that some typhoid fever germs will pass a long distance in running water from the sewers of one city to the water taps of the city below, the city below taking its water of course, from the same river into which the sewers of the upper city discharge.

Q. Now when the water in settling basins is exhausted from one of the settling basins, how is it replenished?

A. Do you refer to St. Louis?

Q. In St. Louis mean?

A. The old method of operating.

Q. How is that?

4353 A. The water is drawn off to a certain level and then it is turned on again, allowed to settle, and drawn again. It is a series of filling, allowing to stand in as quiet a condition as can be obtained, and then drawn off again.

Q. How much of the water is drawn off before it is replenished?

A. This, you understand, is in the old days.

Q. I am speaking of the conditions in St. Louis today.

A. They are not worked that way today.

Q. How are they worked?

A. On the continuous displacement plan.

Q. What plan is that?

A. All of those basins which are not out of service for cleaning are kept full of water. The water is turned into those basins at one end and there are siphons at the other end, and the water having traveled the length of that basin is siphoned over into the next basin, and thence traveling through the length of that, and so on.

Q. At those points where the siphon draws out and discharges there is quite a commotion, isn't there?

A. The velocity is higher than it is throughout the entire width of the basin, but I wouldn't call it a commotion.

Q. Isn't there a commotion or disturbance sufficient to arouse the sleeping typhoid germs that may be in the sediment, to action and thereby get into the water supply of St. Louis? 4354

GENERAL CROW: I object because we haven't proven that they go to sleep.

A. Those siphons take the water, I think, some ten feet from the bottom, and I should doubt whether there would be any material disturbance of the sediment, particularly in those basins through which the water last passes before it reaches the city.

Q. How long would a typhoid germ that got into a settling basin and got into the sedimentation of the basin, live there?

A. A good long while in all probability, some of them would.

Q. And if the water is slightly typhoid infected, it would be liable to accumulate a great number of these little creatures or vegetables during the course of six months, wouldn't it?

A. You mean in the sediment of the basin?

Q. In the sediment?

A. There very likely would be a good many in the sediment, yes.

Q. And they are the last to settle down to rest in the sediment of the water?

A. No sir, the clay is the last to go; in fact all the clay as is well known doesn't go down usually in this water.

4355 Q. The microbes are heavier than the clay?

A. They are larger than the clay particles.

Q. And these basins are exposed to the winds, aren't they?

A. Yes sir.

Q. And with such a wind phenomena as we have had during the last two or three weeks, passing over these basins, wouldn't it have a tendency to stir it at the bottom?

A. There is a tendency in that direction. I don't think there will be a great deal of the sediment brought up but there would be some, though.

Q. And if the waves upon those basins caused by a severe gale or wind, should turn up the sediment in the bottom of these basins, where these typhoid organisms have gathered, that water would be liable to be carried into the intake, wouldn't it?

A. You mean into the outlet?

Q. I mean into the outlet and distributed to the people of the city?

A. It would provided the churning action of the wind were to get that sediment in there.

Q. Would the churning action of the wind be less liable to affect that condition in the sediment basin of St. Louis than it would upon the Illinois river?

A. The basins here are deeper, but if all things were
4356 the same, of coarse nature is going to work the same in
both waters, but the basins of St. Louis are deeper than
are the slack water stretches on the Illinois.

Q. Well, a good strong wind over those settling basins, down here near the Merchant's Bridge would create a great deal of disturbance in the surface of the water, wouldn't it?

A. Yes sir.

Q. And that disturbance would be communicated to the bottom, wouldn't it?

A. It would in a measure, but those basins are still deeper than those at the chain of rocks.

Q. Have they got some at the chain of rocks that are not as deep as those at Bissell's Point?

A. Yes sir.

Q. Well, those at the chain of rocks are not as deep as the ones at Bissell's Point, is that right?

A. Yes sir.

Q. Well, the conditions there would be greater for disturbances from wind than it would be in the other basins, wouldn't it?

A. Theoretically that is so, yes, from very heavy winds. There would be some difference, no doubt.

Q. Now do you think that the water in those basins has three whole days in which to settle?

A. No, I have said it was less than that under the most
4357 favorable conditions.

Q. Would it be about an average of a day and a half?

A. That would be a fair general figure, yes.

Q. You do not consider, as a sanitary expert, that a day and a half to settle in basins where they are gradually taken off and leveled by siphons, as being a sufficient time to eliminate any considerable number of typhoid germs, do you?

A. It will do very well as far as sedimentation alone is concerned, and it undoubtedly does eliminate a very large number. In fact, in practice here it is true that there is a very material reduction.

Q. If the settling basins of St. Louis subjected to a day and a half sedimentation on an average, creates such good results in regard to bacteria and infected germs, why wouldn't the lakes upon the Illinois river, Lake Joliet and Lake Peoria, and the back water of the different dams in the river, effect the same results?

A. They would, provided all the conditions were the same. Nature would work the same in the two instances. There is a great deal of elimination from the flowing stream of typhoid germs and other bacteria, as the water of the Illinois river passes through those basins, but it is not removed as it is in the case of the chain of rocks settling basins. At the chain of rocks
settling basins the sediment is removed by draining the
4358 the basins and washing them out, flushing them out. On

the Illinois river the typhoid germs and other bacteria which leave the flowing water and go to the bottom and lie upon the bed of the streams are subsequently flushed out by conditions which naturally occur on that bed and are returned to the flowing water and pass down toward the mouth; and some of them, many of them, doubtless do reach the mouth of the stream.

Q. How do you know that, Mr. Fuller?

A. It is a matter of common sense from the changing stages which occur in that river, the slope of the river and the various physical conditions which obtain there.

Q. Have you ever found common sense making a mistake?

A. I think it is the best guide I know of to go by.

Q. When these germs sink to the bottom of the lake and the sedimentation of the sewage pollution of the water settles down with them, do you know whether any chemical action takes place down at the bottom where these microbes are?

A. I presume that there is quite a little chemical action going on there.

Q. Do the an-aerobic bacteria have any effect upon the destruction of the bacillus of typhoid?

A. It does under septic conditions, such as would obtain in a septic tank or in the Illinois and Michigan Canal, but
4359 in the bed of the stream, of the Illinois river where such septic action does not ordinarily, if ever, obtain, I do not think that they would effect the life very materially of the typhoid fever germ.

Q. In this back water of the dam, do you know how far above the dam this water is raised, and extends up the river?

A. Well sir, I have studied that carefully. As my memory serves me, some of them would go back forty or fifty miles, but I will look it up if you wish?

Q. No, just the fact that you knew is all I want. When the water is not at flood tide in the Illinois river, do you know how swift the current is through these back-water basins?

A. I have studied that carefully, yes sir.

Q. What is the rate?

A. It gets down to less than a half a mile per hour.

Q. During those times sedimentation can take place, can it not, and does?

A. Yes, to a considerable degree.

Q. And the bacteria of typhoid would go to the bed of the river, wouldn't they?

A. Yes, if they settled, certainly.

Q. They would settle, wouldn't they?

A. A great many of them would settle, yes.

4360 Q. Do you know of any reason why they wouldn't practically, I mean?

A. There would be a very small percentage of them which would not, due to the action of passing boats and wind and those little things, as in all probability occur in the stretches of slack water many miles long, and where the velocity uniformly is very low.

Q. When these settling basins extend over surrounding country where vegetation and grass are plenty, these organisms would get out among the grass, wouldn't they?

A. Some of them would.

Q. And when they got out there, would a freshet drive them back into the center of the stream?

A. That is possible.

Q. Isn't the possibility that they would not, more than they would?

A. I think more of them would not go back than would.

GEORGE W. FULLER.

ADJOURNED until 10:00 A. M., Saturday, May 30, 1903.

4361 Southern Hotel, St. Louis, Missouri. 10:00 A. M., Saturday, May 30, 1903. Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

GEORGE W. FULLER,

resumed the stand for further cross-examination by Mr. Todd and testified as follows:—

Q. Do you know what proportion or what percentage of the bacteria in the St. Louis settling basins are eliminated by the sedimentation processes that take place there

A. The percentage removal as a general proposition is quite variable and as an average I presume it would be in the neighborhood of 75.

Q. Do you know whether the consumption of water in St. Louis is greater in winter than in summer, or vice versa?

A. As a general proposition there are seasonal fluctuations in the quantity of water used. In the summer, owing to warm weather and the amount of water used for sprinkling lawns, there is a high consumption, and in very cold weather in winter there is high consumption because people leave
4362 their faucets open. In the spring and autum, as a general proposition, the quantity supplied throughout the city is somewhat less than those two extremes of summer and winter.

Q. Well, as a general proposition, isn't it a fact that the amount of water consumed in the city of St. Louis in the summer months is far in excess of that for the cold months, or the winter months, on account of sprinkling the lawns, and washing the streets, and bathing purposes, etc?

A. It is somewhat in excess I should say.

Q. And during those months the time of sedimentation in the settling basins would be less than for the other months would it not?

A. It would be somewhat less, but its effects may be very small because, after a period of sedimentation in those basins for a day or a day and a half, the further removal during one or two hours, or three or four hours beyond that period, is comparatively small.

Q. Are you acquainted with the conditions that obtain in what is known as Lake Joliet, as to current?

A. I have looked those matters up as a general proposition, yes sir.

Q. Do you know what the character of the bottom of Lake Joliet is?

A. I haven't personally examined it, no sir.

4363 Q. Would the character of the bottom of a stream have any effect upon the question of sedimentation in the bottom?

A. You mean so far as removal of sediment from the flowing waters is concerned?

Q. Yes, would the bottom have any effect upon the sediment in connection with freshets?

A. So far as the nature of that bottom is concerned, I shouldn't like to say it was anything of a factor, that is, so far as its composition is concerned.

Q. If the bottom of the stream should be a sandy or rocky bottom, or a peat-bog, would the sediment be removed as rapidly from a peat-bog as it would from a sandy or rocky bottom in times of freshet?

A. It would be the velocity of flow of the water at times of freshet which would be the controlling factor, and not the composition of the material forming that bottom.

Q. If in a lake with a bottom of sand or rock, a certain flow of water should pass, would that flow be as likely to remove the sediment if the bottom of that lake, was a peatbog?

A. I don't think practically speaking, there would be any very great difference one way or the other.

Q. Where the bottom is a kind of a vegetable growth, or
a peat-bog growth, and the bacteria settled in that bottom,
4364 wouldn't it be harder to remove that bacteria with the
same current than it would if it was a hard bottom or a
sandy bottom?

A. It might be very difficult to remove those bacteria which were actually lodged, and attached directly to the grass and vegetable matter, but as to those which are simply lying loosely upon the bottom, it is my opinion that that would not be an essential factor.

Q. Do you know what the current is through Lake Joliet?

A. It gets down to a fraction of a mile at times.

Q. Do you know how rapid it gets at times?

A. It must be quite rapid at times; very rapid.

Q. By quite rapid, how would you express that in miles—

A. I presume several miles per hour.

Q. Now is a current of several miles per hour a sufficient current to scour out a lake when that current passes through the center from its inlet to its outlet?

A. I should think that it would remove a considerable portion of them. All of these questions of the degree of removal are the functions of the velocity. One set of conditions with a flow of three miles per hour would remove sediment but to a less degree than a velocity of four miles per hour. It is a question of detail as to degree, fitting velocity with the character of the material to be removed. 4365

Q. Now if the sewage of Chicago, passing through Lake Joliet when the current was only a mile, a mile and a quarter or a mile and half an hour, considerable deposit would take place, and elimination of the germs would be effected in the transmission through that lake, would it not?

A. There would probably be some considerable removal of those germs from the flowing stream.

Q. And part of the germs that entered would be scattered and disseminated over that part of the lake which is not adjacent to the current, wouldn't they?

A. That is possible.

Q. Now, after it passes Lake Joliet, the first dam that it would reach, the upper pool of which extends for several miles or more, would aid in the process of purification by means of sedimentation, would it not?

A. There would be a removal of germs at times when the velocity of flow was small, and such velocities at times do occur, in my judgment.

Q. Do you know whether those times are the greater part or the lesser part of the year?

A. I presume that they would aggregate upwards of half a year. I am not speaking now accurately, but in general terms.

4366 Q. And when these back water pools spread out over the country, overflowing the land, the germs that settled along the shores and on the overflowed land, would be less likely to be disturbed by freshets than that just deposited in the bed of the stream, would it not?

A. I presume that the velocity may be somewhat less there, but I think there are undoubtedly conditions which obtain on these overflowed portions, which would enable some of those germs lying in the sediments on the overflowed banks, to be returned to the stream.

Q. And those conditions would obtain in regard to all the dams along the Illinois river, would they not? What is true of one would be true of them all?

A. Conditions being the same, that is true, there would be at times a sedimentation or removal from the flowing stream; they would become deposited upon the bed, and following would come the scouring velocities and pick up and move them on. As a general proposition that is true.

Q. And during these times, when the germs are in a state of sedimentation, destruction and death would be prevalent among the germs, would it not?

A. To a certain degree there would be a dying out among those germs.

4367 Q. Is there any way of ascertaining how much or how many or what percentage of those germs would live, and what would not?

A. No ready means that I know of. I know that some do not die out within the period of time intervening between the ordinary successions of flood stages and the disturbances which would bring about a removal of the germs from the sediment, and a return of the germs lying in the bed of the stream to the flowing water.

Q. And when the water from Chicago gets to Lake Peoria, do you know what the current of Lake Peoria is?

A. No sir, I am unable to state that from my memoranda that I have at hand.

Q. Do you know whether the current at Lake Peoria even at high stages of water, exceeds two miles an hour?

A. I should not expect it would exceed it under all ordinary high stage conditions.

Q. Assuming that the current in Lake Peoria at the time that Professor Van Ornum made the float test was six-tenths of a mile per hour, would that current be sufficient to scour out the lake?

A. That velocity would not make a complete removal, but there would be disturbances probably, boats and wind actions, and such things, which would make a considerable removal of sediments, but not complete.

Q. Assuming that at the time that that experiment was

4368 made, that showed six-tenths of a mile an hour, that the water was at high stage, almost its maximum at Peoria, can you conceive of a freshet under normal conditions creating a greater current in Lake Peoria than existed there under the high stages of water at the time that that experiment was made?

A. Not any very material increase beyond that point, but of course it is to be borne in mind that in these reaches of quite considerable width, if the water overflows the banks, that the velocities do not advance according to the stages; that is, velocities in the main stream do not increase proportionately to the increase of the river heights, as shown on the river guages.

Q. Now you speak of disturbances by boats. Have you any idea of the number of boats that run up the Illinois river from Peoria?

A. No. I don't imagine there are a great many.

Q. If it should appear that not one boat in three weeks or six weeks went up the river above Peoria, would you attribute very much importance to the disturbances which that boat would create?

A. No sir. So far as boats are concerned, that is one of several factors. It is the end result which I was considering; that is the information which is available showing that those deposits are not permanent and accumulative. 4369

Q. If the sedimentation in Lake Peoria is constantly going on and the current at maximum stages of the river, or high flood of the river, is only six-tenths of a mile per hour would you consider that a scouring was possible to take place in Lake Peoria?

A. I should consider that bacteria would be removed from the sediment of the stream under the existing conditions, taking all of those together, collectively, on this basis. There is suspended matter at times coming into the stream above Lake Peoria; that sediment passes through the lake. If that sediment is not deposited, it indicates to my thought very clearly, that the conditions are such that bacteria may be removed,—upon comparing now the hydraulic subsiding value of the particles of a mineral nature suspended in that water, with that of the bacteria which at low velocities of flow may become and do become deposited upon the bed.

Q. The velocity of the current would decrease as you went away from the channel of the lake, would it not?

A. I should expect it would decrease somewhat.

Q. And the water entering the lake at the intake would be distributed over the surface of the lake, would it not?

A. In a general way that is true.

4370 Q. And that water which gets in the lake outside of the channel would have better opportunities for sedimentation than that which is immediately in the channel would it not, because of its quiescent state?

A. Well, there is no such thing as a thoroughly quiescent state, so far as velocity of flow is concerned. The conditions would be very favorable, but we also have to take into consideration this fact, that sedimentation and also scour are affected by changes in velocity and changes in condition within certain limits independent of the absolute flows.

Q. There is no quiescent state in the settling basins of St. Louis, is there?

A. Not absolute quiescence, no sir.

Q. Now when this water gets to Peoria, after passing the dams above Peoria, and the lakes above Peoria, considerable elimination of its infection and polluted matter is accomplished, is it not?

A. On an average that would be true. I presume ordinarily that is true, but there are times when I think that that is not so.

Q. Do you know how long a germ of typhoid fever would exist in polluted water such as would come from the distilleries and glucose factories of Peoria?

A. I should think some might live for several weeks or months.

4371 Q. Do you know, is my question. Not what you think.

A. I know of places where water has been polluted with refuse similar to that, and I know that that does not kill the typhoid fever germs.

Q. Have you ever made any laboratory experiments to ascertain whether in sewage of that kind typhoid fever germs would exist?

A. I have not.

Q. Have you analyzed the sewage that comes from the glucose factory at Peoria?

A. No sir.

Q. Have you any idea as to the volume of sewage that is emptied into the Illinois river from those factories and distilleries?

A. I know that the volume cannot be a very material one, for in examining the analytical evidence I have been unable to detect that that is a controlling, or, I might say, a general or dominating factor, taking this entire proposition of the disposal of the Chicago sewage as it comes down through the Illinois river.

Q. If you were called upon to pass upon the condition of the water of the Mississippi river at present in the absence of any knowledge or effect of that water, would you be able as a sanitary engineer to tell whether it was safe or
4372 usable or not?

A. You are speaking now independent of typhoid fever statistics, which is the best—

Q. I am speaking independently of the results.

A. Why I should say that the amount of sewage pollution in the Mississippi river at the chain of rocks intake tower considering that water in its raw condition, is such that it would not be thoroughly safe.

Q. How would you ascertain that fact?

A. I would consider it with reference to the amount of pollution entering the streams above.

Q. Suppose that you did not know the amount of pollution entering the streams above?

A. Well, I think it is very essential for any sanitary engineer or sanitary expert to ascertain that information and it would be a very reckless proposition for anyone to make a definite statement in the absence of such information.

Q. Is there any way that a sanitary engineer can ascertain from the water itself whether it is a safe and usable, or a dangerous water?

A. He can get considerable assistance through the tests made for the presence of intestinal bacteria. If in examining it at very frequent intervals in large quantities such water, so

that he will get information representing both the flow
4373 and the element of time, day by day, at different cross sections, and he finds that intestinal bacteria are absent—

Q. What bacteria do you mean?

A. Colon bacillus—if that is absent in that water, or if it is necessary to test very large volumes of that water in order to get a positive result, he would be able to get considerable assistance in forming a judgment in a practical way, regarding the pollution of that water.

Q. Does the coli bacillus come from fish?

A. Why in my judgment that is not very much of a practical proposition in these streams out here. I base that on my experience that in mountain streams where fish are very abundant, there does not seem to be anything in the fecal discharges of fish to distort to any very serious degree the practical results to be derived from the colon bacillus tests which I described. I do recognize, however that there is evidence on record that some fish do contain the colon bacillus. Personally I am not posted on that. I go on my own practical experience with mountain streams, where I know that fish predominate and where the coli is shown to be uniformly absent.

Q. If it should appear that the fish that infest the Illinois River did discharge the colon bacillus into the waters through their intestines, and that the stream itself is impregnated with fish to a large extent, would the presence of
4374 the coli bacillus be any evidence to you of sewage pollution?

A. If I satisfied myself that there were no opportunities for sewage to enter that stream, and still found that the colon bacilli were present in relatively large numbers, why I certainly would consider that to be a factor, and would want to investigate what the chances are of large numbers of colon coming from fish.

Q. Does it require an expert man who has devoted any great considerable time to the study of water to draw a conclusion where he knows that sewage enters water, and where he knows that the people drinking that water become sick?

A. It does not require a great deal of technical training to ascertain whether sewage enters water, but it does require skill and judgment and good practical common sense to know whether there is going to be serious danger resulting among those persons who drink of that water at various places.

Q. Can you tell whether there will be danger to the people drinking that water before the danger has manifested itself in sickness and typhoid fever, by the examination of the water itself?

A. It is possible to form judgment as to the liability of there arising from sewage pollution the liability of serious danger coming to those people who drink of the water, and forecast that in advance of the vital statistics among the
4375 people consuming such water.

Q. Well, that is not an accurate, scientific demonstration is it; it is mere guess, isn't it?

A. No sir, that is an aid which a practical man can use in interpreting existing conditions as they are found in nature.

Q. In regard to the typhoid germ living in the sediment of streams, do you know of anyone that has ever discovered a typhoid germ in the sediment of a stream, a running stream?

A. It has been found in the sediment of lakes, and we know it exists beyond all doubt in the sediment of running streams.

Q. Has it ever been demonstrated by bacteriologists that typhoid germs have lived in the sediment of a running stream?

A. It has been demonstrated that they have lived for a long time in the sediment of lakes, and I do not consider that there is any weakness in the process of reasoning by which one steps from a lake to a river, provided of course that each of those waters are live waters, and not subjected to septic action.

Q. By whom has it been ascertained that the typhoid germ has been found to live in the sediment of a running stream or a lake?

A. There are observers over in Switzerland who made such examinations with a positive result, showing the presence of typhoid germs in the sediment of Lake Geneva, I think also Lake Zurich.

4376 How long after the germs were put into the sediment was it before they were discovered?

A. I don't know in the case of the particular germ which they found, but they were found considerably more than a mile from the shore, or from the outlet of any sewers.

Q. Isn't the length of time that a typhoid bacillus will live in a sediment, more a matter of assumption than a matter of demonstrated proof?

A. I consider that it is a very clean cut demonstrated fact, that typhoid fever germs may, do and have continued to live in the sediments of running waters.

Q. For what length of time?

A. I should say for a month or more, possibly in cases for years.

Q. Who has demonstrated that it ever lived a year?

A. I think that the conditions existing in the moist soil in many rural places in this country where typhoid fever prevails from time to time, are proof that typhoid fever germs in the presence of moisture can live for such a term. If that were not so, then there would be an elimination absolutely, of typhoid fever through the rural districts of this and all other countries.

Q. Are those the facts upon which you claim that the life of the typhoid bacillus for a year has been scientifically
4377 demonstrated?

A. That is one of the principal factors to which as a scientific man, I give great credence in showing that typhoid fever germs are not eliminated absolutely within that period of time.

Q. By that same process of reasoning, couldn't you have credence that it would live a thousand years as well as a year?

A. Well I am not familiar with vital statistics for such a period of time.

Q. Are you familiar with the vital statistics for a year?

A. In many places I am.

Q. Where is any one place that you have personally investigated and have demonstrated that a typhoid germ has lived for one year, whether in laboratories, or elsewhere?

A. Why, my common knowledge of the existing conditions in many country towns, satisfies me beyond all doubt as a scientific man, that those germs have lived for at least a year.

Q. Is your common knowledge superior to scientific demonstration?

A. In a great many instances it is vastly superior to it.

Q. What do you mean by common knowledge, Mr. Fuller?

A. I mean that information which leads one to the truth in explaining phenomena as they exist in nature.

Q. Is that a matter that can be scientifically demonstrated?

A. Science can do no more than show the truth.

4378 Q. Well, has science ever demonstrated what your common knowledge has proclaimed as the truth?

A. I should put science and common knowledge in the instance of which we are speaking, in the same class.

Q. Do you know of any specific instance where you have personally investigated and established beyond all reasonable doubt that a typhoid germ has lived for one year?

A. I am satisfied that beyond all reasonable doubt those typhoid fever germs which cause typhoid fever to prevail in isolated rural communities in many places in New England with which I am familiar and where I spent my boyhood days, that these germs most unquestionably did live in some instances for at least a year.

Q. Do you regard that answer as an answer to my question, —as a scientific answer to my question?

A. As a practical proposition I say that that answer is responsive to that question, because science can do no more than explain the truth; science aids in that, and that is the purpose of science, to find out the reason why.

Q. What in your answer to my previous question contains elements of a scientific demonstration?

A. A scientific demonstration, as I understand the expression, means the use of procedures which ascertain the truth and I am satisfied that in the answer which I gave those conditions which I considered and mentioned, do lead me to the truth. 4379

Q. From that scientific investigation, as you denominate it, in answer to my question, was it scientifically demonstrated that the typhoid germ in the places and localities which you indicated, only lived one year or lived a period in excess of one year?

A. I presume that some of them did live more than one year. I think that that is a fair and correct assumption.

Q. How many years would you say that the typhoid fever germ in the instance that you have given has scientifically been demonstrated to have lived?

A. I will say several years. I will not go into details beyond that. I think unquestionably they live several years.

Q. By "several" do you mean three or two?

A. In that general vicinity, two or three, as compared with, well, say 100.

Q. Do you know of any other scientific man that holds that a typhoid germ lives as long as three years?

A. In the soil, you mean, and where moisture prevails?

Q. Where it has been discharged from the bowels of man?

A. Yes, sir; I think that there are people who hold that view, particularly that group of scientists who may be classified as epidemiologists. If that were not so, then the
4380 transmission of infectious diseases cannot be explained.

Q. Name me one man by name who holds that a typhoid germ will live three years?

A. I think I am safe in stating Professor Sedgwick.

Q. Anybody else but Professor Sedgwick?

A. No doubt there are a good many.

Q. That you can name, I mean?

A. I have not personally conversed with a great many people on the subject. I think that there are, unquestionably, others though.

Q. Well, name me anyone who has exploited that longevity for a typhoid bacillus, in any work?

A. I don't recall at the moment.

Q. You have made a study of bacteriology, have you not, Mr. Fuller?

A. I have given a good deal of study to it, several years ago.

Q. Have you ever discovered in the waters of the United States the prodigiosus bacillus?

A. I think that that was found in the Ohio river at Cincinnati on one occasion, in the course of over a year's investigation, involving practically daily examinations of the water of the Ohio river.

Q. Where one bacillus of a peculiar bacteria is discov-

4381 ered, as a scientist, you would not hold that that was an isolated case, would you, but that there were others existing in the same water, would you not?

A. There is a possibility of that, but it is a fact that the bacillus prodigiosus is very, very rarely found in American waters, according to the information now available, and it is a very easy germ to discover. It is one which is given to beginners in their class work, and if it were found very abundantly or very frequently, I am sure that that would be very widely known among bacteriologists.

Q. Will a typhoid germ live a year in water?

A. Some, out of a large number, put in water, I have no doubt will live a year.

Q. If a typhoid germ should be deposited in Lake Itasca, from the excreta of an Indian up in that neighborhood, and that typhoid germ floating down the Mississippi should enter the intake at New Orleans, and get into the system of a creole, would that creole be likely to take typhoid fever?

A. I think there is a decided possibility in that direction, and if there were enough of those individual instances of one germ coming down from Lake Itasca to the New Orleans intake, there would surely trouble result to the person drinking that water in its raw condition, and in which were present germs coming from Lake Itasca.

4382 RE-DIRECT EXAMINATION, by General Crow.

Q. Mr. Fuller, you were asked on your cross-examination about whether or not you had any knowledge as to typhoid bacilli being traced through the out-falls of the sewers of a city, into running streams conveying typhoid to persons using the water in cities below upon that same stream, into which the sewers emptied. I will get you to state if on any of our western rivers you have had any experience that would lead you to that conclusion?

A. Yes, in the instance of the sewage polluted Ohio river water, which is taken as the source of supply for the city of Louisville. Considerable typhoid fever prevails in the city of Louisville. After the water supply is drawn from that river it is passed through the settling basins, holding some five or six

days' supply, and in which sedimentation takes place. The sewage coming into the Ohio river is almost entirely confined to points at and above Cincinnati, which is distant about 150 miles by river. At times of very low flow in the river the velocity is such that the period of time for some of those germs to pass from Cincinnati to Louisville from the sewers of the city of Cincinnati to the taps of the citizens of Louisville, is more than one month. I consider that that is a very
4383 reliable demonstration that typhoid fever germs are not absolutely removed from sewage polluted waters, in which that pollution takes place one month before the water is used for domestic consumption.

I will further state that in the instance of the waterworks plant in the city of Covington, Kentucky, the source of this water supply is the Ohio river. There are provided sedimentation basins holding approximately thirty days' supply. It has been found that year after year the citizens of Covington using the Ohio river water coming from those basins are not protected from typhoid fever.

As to the pollution which exists in the Ohio river at Cincinnati, I consider that there is no room for doubt, but that a portion of the pollution existing in the Ohio river at Cincinnati is due to the sewage coming from the cities and towns located in Allegheny county, Pennsylvania, including its two principal cities, Pittsburg and Allegheny. This distance is between 450 and 500 miles.

Making this statement clearer, I will further say that in my judgment were all sewage pollution of the Ohio river and its tributaries between Pittsburg and Cincinnati eliminated, I consider that the Pittsburg sewage would unquestionably make its influence felt in the hygienic character of the river water at Cincinnati.

Q. Mr. Fuller, I will ask you if you have any facts or
4384 information bearing upon the question as to whether or not in Lake Peoria and other slack water places on the Illinois river, deposits of sediment have appreciably accumulated upon the bed of the stream?

A. There is documentary evidence to that effect, and there is also practical observation as to the amount of scouring which must take place. As to the former I will state that it is on record in reports of the Chief of Engineers of the United States Army, that the engineers in charge of the Illinois river, find that where channels are dredged in that river, they are nearly permanent. "Channels dredged twenty years ago are but little deteriorated, and it is surprising to find that there has been no deterioration in depth in the pools created by the Henry and Copperas Creek dams after from fifteen to twenty-eight years' use."

Q. Where is the Copperas Creek dam with reference to Lake Peoria?

JUDGE JOHNS: It is about 27 miles below Lake Peoria.

GENERAL CROW: And where is the Henry dam?

JUDGE JOHNS: That is above.

THE WITNESS: That is above. That last statement as to channels is a quotation from Major Marshall in the report of the Chief of Engineers, United States Army, 1895, page 2716.

4385 The same gentleman is quoted in the report of the Chief of Engineers of the United States Army, 1898, page 2436, as follows:

"The dams (meaning in the Illinois river) have no appreciable effect above mid-stage of the river when currents are the strongest, so that all lighter sediment is swept away as well now as before constructing the dams. That there has been no appreciable change felt in the pools of the Illinois river is a fact that has been so often remarked upon by steamboat men and persons interested in the use of the river since the construction of the first dam at Henry, thirty years ago."

JUDGE JOHNS: I move to strike out portions of the answer which are read from the reports named in the answer, as not competent evidence.

GENERAL CROW: Now, Mr. Fuller, I will ask you from all the information you have of every kind, as to whether or not it is your judgment that any great amount of sediment does accumulate and remain upon the bed of the stream of the Illinois river, for any great length of time?

A. In my judgment not.

RE-CROSS-EXAMINATION, by Judge Johns.

Q. What towns are on the Ohio River shore on either side between Louisville and Cincinnati?

4386 A. The Ohio river between Louisville and Cincinnati has situated upon it no towns of any considerable size below the towns of Aurora and Lawrenceburg, at the mouth of the Miami river which is some 20 or 25 miles below Cincinnati. About 50 miles above Louisville there is the little town of Madison which some years ago was quite prosperous when the cooperage business was being carried on there; a town I suppose of some 6,000 people; but when I lived in Louisville, I know there was no public sewerage system of any consequence and I doubt whether there were any sewers other than through private drains, which are used in towns of that size, so that for a distance of about 125 miles on the Ohio river above Louisville, we may say practically speaking, that there is no sewage entering the river.

Q. How many communities, of you will dignify them as towns, are there upon the banks of the Ohio upon either side between Louisville and Cincinnati?

A. Within what distance from the river?

Q. Well, upon the banks of the river?

A. There are very few as I remember. I have been frequently up and down that river on a steamboat, and the boats have a good deal of trouble, according to my observation and experience, in finding their landing places. There are not many habitations on the Ohio river between those two cities

4387 which could contribute in any appreciable degree, sewage to the waters of that stream.

Q. Has the Ohio river a considerable river population, by that meaning people who live in boats upon the river and upon the shores of the river as fishermen and otherwise, between Louisville and Cincinnati?

A. There are some people living in house-boats on the river.

Q. Are there tributaries of the Ohio between Louisville and Cincinnati, on either side?

A. The only river of any importance entering the Ohio between Louisville and the mouth of the Miami 25 miles below

Cincinnati, is the Kentucky river. The mouth of that river is distant from Louisville I should say 50 or 60 miles.

Q. Are there any small tributaries of the Ohio between Cincinnati and Louisville other than the Kentucky river.

A. There are some small creeks, but so far as I recall, there is no opportunity for any material amount of sewage pollution to enter the Ohio from those creeks. I looked into that matter several years ago, when I spent three years in studying the quality of the water and its improvement at Louisville, and I recall that there is nothing nearer to Louisville, where direct sewage enters the stream than the town of Frankfort, some 90 miles distant by water, and having a partial sewerage system. That town has a population, as I recall, of some 12,000 or 14,000 people. 4388

Q. Covington, Kentucky, is opposite Cincinnati on the Ohio river?

A. Yes, sir.

Q. And the conditions which obtain in Cincinnati, you think, exist also in Covington?

A. In what respect, sir?

Q. As to typhoid fever and the causes?

A. There isn't so much typhoid fever in Covington as there is in Cincinnati?

Q. In proportion to population?

A. In proportion to population, there isn't so much.

Q. But still, Covington is not free from typhoid fever, you think, from its water supply?

A. That is my judgment, I am sure.

Q. The reports of the United States Engineers from which you have read, are reports as to channels dredged in the Illinois river?

A. I so understand.

Q. They are not reports as to conditions obtaining on either side of those dredged channels?

A. There is a statement on page 2716 in the report of the Chief of Engineers of the United States Army, for the year 1895, containing a quotation from Major Marshall to the effect "that the State of Illinois controls and collects tolls over 90 miles of this river and has never completed this part of the improvement by dredging the pools above its dams." 4389

I will say further that the general information available upon that matter indicates that there isn't any material silting up of the pools away from any dredged channels.

GENERAL CROW: I will get you to state, Mr. Fuller, what would be the effect upon any stream and upon the Illinois river, if there was constant accumulation and no scouring out of the material of any kind that might be deposited on the bed thereof?

A. There wouldn't be any river bed there.

GEORGE W. FULLER.

4390 WILLIAM H. GETZ, recalled as a witness in behalf of complainant, was examined in chief by Attorney-General Crow and testified as follows:

Q. Now, what table is that you have, Mr. Getz?

A. This is the same table which I presented before, showing the percentage of mixtures of the Mississippi and the Missouri rivers at the intake of the St. Louis Waterworks.

Q. Now, have you examined that table and made any correction on that?

A. I have gone over this table, yes, sir; very carefully from the original charts and checked all the calculations.

Q. That was offered before?

A. Yes, sir.

Q. Now, you can just state how you verified those amounts and made those corrections.

A. I took the sheets on which these results were tabulated.

Q. The original results?

A. Yes, sir; the original sheets, and checked or transferred all those numbers to this table, and then the calculations which followed.

Q. This purports to be a table of percentages of Missouri and Mississippi river waters at the intake of the St. Louis
4391 Waterworks, calculated from daily estimates of total solids from samples collected at Bellefontaine, intake and Hartford?

A. Yes, sir.

Q. Now, can you state whether or not that table is correct now as made from examinations and analyses of the water?

A. I think there is no reason to doubt it.

JUDGE JOHNS: The per cent. of Mississippi river water there is obtained how?

A. The difference of amounts of total solids in the Mississippi river and in the Missouri river, at the points where these samples are taken, is found, and also the the difference between the total solids at the intake and those at Hartford on the Mississippi river.

Q. Then how do you obtain the per cent.?

A. The per cent. would be, or the percentage of Missouri river water, for instance, would be the total difference divided into the difference between the intake and Hartford.

Q. The per cent. of Mississippi river water is obtained there, by calculating it between what two figures in the columns of this table?

A. The final resuts for the percentage of Mississippi river is taken from the column headed Bellefontaine minus Hartford, and the column headed Intake minus Hartford.

4392 Q. Now, in the first line of the first page "Bellefontaine minus Hartford" is 300. "Intake minus Hartford 220," and that calculation arrives at the conclusion that 220 is 73 per cent. of 300?

A. Yes, sir.

Q. And therefore there is 73 per cent. of Missouri river water and 27 per cent. of Mississippi river water at the intake, on the 24th day of January, 1900?

A. Yes, sir.

Q. Is that correct?

A. Yes, sir.

The table above referred to by the witness is in words and figures as follows, to-wit:

4393 PERCENTAGES OF MISSOURI AND MISSISSIPPI RIVER WATER AT THE INTAKE OF THE ST. LOUIS WATERWORKS.

Calculations based upon the daily estimation of total solids in samples collected at Bellefontaine, Intake and Hartford, January 23rd to October 11, 1900.

End of table.

ADJOURNED to Southern Hotel, St. Louis, Mo., June 1, 1903, at 10 A. M.

Southern Hotel, St. Louis, Missouri.
4415 10:00 A. M., June 1, 1903.
Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

No witnesses being present, an adjournment was taken until 10:00 A. M., June 2, 1903.

Southern Hotel, St. Louis, Missouri.
10:00 A. M., June 2, 1903.

Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

No witnesses being present, an adjournment was taken until 10:00 A. M., June 3, 1903.

Southern Hotel, St. Louis, Missouri.
4416 10:00 A. M., June 3, 1903.

Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

No witnesses being present, an adjournment was taken until 10:00 A. M., June 4, 1903.

Southern Hotel, St. Louis, Missouri.
10:00 A. M., June 4, 1903.

Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

No witnesses being present, an adjournment was taken until 10:00 A. M., June 15th, 1903.

10:00 A. M., June 15, 1903.
Southern Hotel, St. Louis, Missouri.

Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

No witnesses being present, by consent a further adjournment was taken until June 22nd, 1903, at 10:00 A. M.

Southern Hotel, St. Louis, Missouri.
4417 10:00 A. M., Monday, June 22, 1903.

Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

HIRAM R. MILLS,

called as a witness in behalf of the complainant, being first duly sworn, by the Commissioner, was examined in chief by Attorney General Crow, and testified as follows:

Q. Please give the stenographer your name, occupation and residence?

A. Hiram R. Mills.

Q. Give him your address please?

A. Soldiers' Home, Grand Rapids, Michigan.

Q. What is your occupation?

A. Physician.

Q. How long have you been practicing medicine?

A. Thirty-five years.

Q. Where have you resided nearly all the time?

A. Port Huron.

Q. Michigan?

A. Michigan.

4418 Q. That is your home at this time, is it?

A. No sir, my home now is at the Soldiers' Home, Grand Rapids.

Q. When did you leave Port Huron?

A. The 25th of April.

Q. What year?

A. Last.

Q. 1903?

A. 1903.

Q. You were a practicing physician in Port Huron?

A. Yes sir.

Q. In 1888, 1889, 1890, 1891 and 1892?

A. Yes sir.

Q. Now what stream is Port Huron on?

A. It is on the St. Clair River.

Q. Now what stream empties into the St. Clair River at that point?

A. Black River divides Port Huron into two parts and empties into the St. Clair river.

Q. With reference to the size of the town on either side of the Black River, how is it, equally or unequally divided?

4419 A. There is not a great deal of difference.

Q. What is the present size of Port Huron in population?

A. About 21,000.

Q. What was it in 1890, 1891 and 1892?

A. Oh, probably about 15,000 or 16,000.

Q. Was Port Huron sewered, or any portion of it in 1890, 1891 and 1892?

A. I know some of it was, but I don't know exactly what portion of it was. I know a large portion of it was.

Q. On both sides of the river?

A. Yes sir.

Q. What is the topography of the ground upon which Port Huron stands, on either side of the river? Just describe it.

A. On the north side it is higher than it is on the south side, some, I think, perhaps not a great deal of difference, and it is pretty well elevated above the river and the north side, is quite sandy. The south side is more clay.

Q. If there is any natural drainage to the town there, state what it is?

A. The natural drainage for the greater part of the town is into Black River.

4420 Q. Now do you know whether or not in 1889, 1890 and 1891, in January and February and March, of 1892, there were any typhoid cases?

A. Yes sir, there was.

Q. In Port Huron?

A. There has been typhoid fever there off and on every year since I have been there, more or less cases.

Q. How long have you been there?

A. Thirty-three years. I have been there 33 years in December next.

Q. Do you know of any cases in the summer and autumn of 1891 in Port Huron?

A. Yes sir.

Q. How many cases did you have personal knowledge of?

A. I have just made a little memorandum of some of the typhoid cases. (referring to paper.) In 1891 there were four cases I looked up.

Q. Four cases or four deaths?

A. Four cases.

Q. That were under your personal knowledge?

A. Yes sir.

4421 Q. What months in 1891 were they?

A. Well, I thought I had that arranged. Here is one in August and September, 1891; one in October, 1891. I could have that arranged—

Q. Oh, never mind.

A. I thought I had that.

Q. When were the other ones?

A. 1891 there was one in April and May in 1891.

Q. Were there any cases in 1890?

A. Yes sir. Four in 1890, and in 1891 four. Let's see. I will have to look at that again.

Q. What months were they?

A. There is one in June and July.

Q. MR. TODD: What year?

A. 1890, and one in October and November—just October, that's all, and then one in September and October and another in October and November. I guess that is the four.

Q. GENERAL CROW: Did you have any in January, February or March, 1892?

A. I didn't have any record of 1892. In fact, I don't know that I looked particularly for 1892.

4422 Q. Where do the sewers of Port Huron empty into?

A. The sewers of Port Huron empty into the Black River largely, almost entirely.

Q. Have they been emptying in there a long time?

A. Yes sir.

Q. Do you know whether or not Black River has ever been dredged by the Federal Government?

A. Yes sir, it has.

Q. What year?

A. In 1891 and I think it continued into 1892.

Q. With reference to the outfall, that is the emptying point of the sewers, where was this dredging done?

A. That was done past those points and above and below.

Q. You mean at the point—

A. At those points and above and below, dredged from the mouth of the river up to Railroad Bridge; the river was dredged from the mouth of Black River to the Fiber Works.

Q. Fiber Works?

A. Yes sir, that was above the dredging.

CROSS-EXAMINATION,

4423 By Judge Johns.

Q. In 1890, 1891 and 1892 was there a Board of Health in Port Huron?

A. There was a Board of Health, but it was not in very active running order.

Q. Were you a member of it?

A. No sir.

Q. Did they have there statistics of the deaths and causes of deaths, kept in an official record?

A. At that time?

Q. Yes.

A. No sir.

Q. Did they in 1892?

A. No sir; the deaths and births were collected by the Supervisors twice a year.

Q. Was a record kept of them then, as collected by the supervisors?

A. Yes, I don't know what became of them. I have never seen them. As a matter of fact I suppose they were kept. I knew that was the law.

Q. Were they recorded in tabulated statements?

4424 A. No sir, I don't know anything about it.

Q. Or did the supervisors simply go after and collect the statistics?

A. Yes sir.

Q. And make a minute of it in their proceedings?

A. I don't think they made any minute of it in their proceedings. They had blanks furnished by the State, and there was some disposition made of those blanks. There ought to be a copy in the County Clerk's office.

Q. Do you know whether there is one or not?

A. I do not.

Q. These cases in 1890, the first one in June and July; what was the case?

A. You mean the name of the person?

Q. Yes?

A. Let's see, I couldn't say—oh, the first one was in 1890. Let's see; there were four in 1890—I just ran over this hurriedly (referring to memorandum) There is Otis Scott, corner Broad and Ontario Street, in 1890, June and July.

Q. Did you attend him personally?

4425 A. Yes sir.

Q. Did he live or die?

A. He died—did he live? He lived.

Q. Where is this place in Port Huron?

A. Where is it?

Q. Yes?

A. Why, it is not far from the—it is on Ontario, right near the Ontario Street sewer.

Q. Is the house connected with the sewers, or was it then?

A. I think it was at that time.

Q. Are you quite sure about that?

A. Why, I don't know that I could say positively, but that is my impression. I understood that at the time it was connected with the sewers, but I couldn't say positively that it was, because I didn't make the examination to trace it up and see.

Q. And did you cause the dejecta from this patient to be thrown into the sewer?

A. I told the nurse as to what to do with the dejecta; she was to use disinfectants and put it into the closet. I think

4426 their closet was connected with the sewer.

Q. Now then, before it was put into the sewer, it was disinfected,—at least you ordered it to be?

A. I ordered it.

Q. Whether it was or not you don't know?

A. Whether it was or not, I couldn't say.

Q. It was disinfected by what means, or what process?

A. To use carbolic acid or copperas, and sometimes put into boiling hot water.

Q. It would be received into some vessel and then disinfected, either by boiling or putting in some disinfectant?

A. Those were the instructions, yes.

Q. Whether that was done or not you don't know?

A. I couldn't say.

Q. You paid no attention to that?

A. Well, I wouldn't be there every time to see whether it was done or not.

Q. The second one was in October—who was that person?

A. Let's see; that was in 1890 that we are on?

Q. Yes sir.

A. Mrs. Bunce, Lepear Avenue.

4427 Q. At what number on Lepear Avenue?

A. Well, it was near 9th Street; it is almost directly opposite 9th Street on Lepear Avenue; it would be 800 and about the last number in the block.

Q. Was there a sewer on Lepear Avenue?

A. Yes sir.

Q. Was this house connected with the sewer?

A. I don't know whether it was at that time or not.

Q. Did you also give instructions there for the disinfecting of that dejecta?

A. I always give instructions to that effect.

Q. Do you know in that case whether it was disinfected or not?

A. I do not.

Q. And whether or not the dejecta went into the sewer or not, you don't know?

A. I could not say positively that it did.

Q. The next was in October,—September and October?

A. Of 1890?

Q. Yes sir.

A. That was Fred Gooding; that is the name, Ontario
4428 Street near Pine Grove Avenue.

Q. Was that house connected with the sewer?

A. I think it was; I am not sure about that either.

Q. You are not certain that that house was connected with the sewer?

A. No sir.

Q. Well, you gave orders there to have the sewage disinfected,—the dejecta disinfected?

A. Always.

Q. Do you know whether it was or not in that case?

A. I do not.

Q. Do you know whether the dejecta from that patient, whether disinfected or not, went into the sewer?

A. I couldn't say positively that it did.

Q. Now the next was in October and November?

A. Another in 1890?

Q. 1890?

A. Massmore on Lepear Avenue. That was connected with the sewer at that time.

Q. That was connected with the sewer?

A. Yes sir.

4429 Q. You gave the usual orders to have the dejecta disinfected?

A. Yes sir.

Q. Do you know whether it was done?

A. I suppose it was, but I don't know.

Q. Do you know whether dejecta, whether disinfected or not, went into the sewer?

A. I don't know that it did, but I suppose it did.

Q. You had no positive knowledge on that?

A. No sir; the nurses were instructed to do it, and I suppose they did.

Q. Now in 1891 there was a case in August and September; who was that?

A. In 1891—August—Mrs. John Folkers, Miller Street, 1209.

Q. Was that house connected with the sewer?

A. I don't know. There was a sewer right in front of the house on Miller Street.

GENERAL CROW: What location do you say that was?

A. Miller Street.

Q. Near what?

A. Between 12th and 13th,—near 12th,—1209, that's what it is; that would be between 12th and 13th. No sewer there.

4430 Q. JUDGE JOHNS: Was there any sewer on that street for that house?

A. No sir.

Q. What became of the dejecta of that patient?

A. It was thrown into the closet and the closet drained into the little stream there, the Indian Creek, or the stream that ran down into Indian Creek.

Q. Through the sand?

A. No, that is the clay.

Q. It is clay?

A. Yes sir.

Q. This dejecta then, from this closet percolated through the clay?

A. Through the outside; they didn't have the deep outhouse vault; it was one of those surface vaults.

Q. It might be washed out by flood or something of that kind?

A. Yes sir.

Q. Now as to that case, was there such a condition of rainfall as to flood this out-house?

A. Yes, there was the location—at any time there was a 4431 heavy rain, there would be a certain amount of the sewage from this vault, or this outhouse, which would go into the Indian Creek, and that went into Black River.

Q. Now you gave the usual orders there to have the sewage disinfected?

A. Yes sir.

Q. Was it done?

A. I don't think it was.

Q. Why do you not think so?

A. Why, it was that class of people that would not be apt to do it if you did tell them to.

Q. Did you have a nurse there?

A. Yes, one of the daughters; they were German people,—working people, and they didn't think it was necessary, very likely.

Q. But do you have any positive knowledge in regard to it, doctor?

A. In reference to what?

Q. In reference to disinfecting the sewage or the dejecta of this patient?

A. No sir, I have not.

Q. Do you know?

4432 A. I don't know whether they attempted it or not; I told them to do it; I gave them the instructions; now whether they did it or not, I can't say.

Q. Now, you have absolutely no knowledge on that point?

A. No sir.

Q. You have no knowledge either positively, as to whether the dejecta of that patient, disinfected or not, went into the vault or into the out-house?

A. Well, personally, no sir.

Q. That is a surmise?

A. That would be a natural inference without any personal knowledge.

Q. Now you had another in October?

A. In October, 1891?

Q. Yes sir.

A. Well, that is another of the same family; they lived on Quay Street; that is right on the bank of Black River.

Q. Was it connected with a sewer in this house?

A. No sir.

Q. Where was the outhouse?

4433 A. The outhouse was practically on the dock over the edge of the river.

Q. Do you know whether that dejecta was disinfected or not?

A. I do not.

Q. Did you give orders to have it disinfected?

A. Yes sir.

Q. Did you have another in 1891?

A. I think that was all there was.

Q. In April and May?

A. April and May—Yes, I have it here, in 1891, was it?

Q. Yes?

A. April and May, John McFadgen, Court Street; that is between Seventh and Eighth, in that old Stevens house,—That is connected with the sewer I think.

Q. Was it connected with the sewer in 1891?

A. I think it was. I think there was a sewer on Court Street at that time.

Q. Are you quite sure about that?

A. I don't know, sir; I never traced it.

4434 Q. Whether there was a sewer or not, do you know whether this house was connected with a sewer, so that the—

A. I know they had the regular closet in the house, and I would infer that it was connected with the sewer.

Q. Did you give the usual orders there to have the sewage or dejecta disinfected?

A. Yes sir.

Q. Do you know whether it was done?

A. No sir.

Q. Have no knowledge upon that point?

A. No sir.

Q. Now in 1890 and 1891, did the city of Port Huron take its water supply from any public source; was there a public waterworks there?

A. In 1890 and 1891?

Q. Yes?

A. Yes, the waterworks were in before that.

Q. Where did they obtain their supply?

A. From the St. Clair River.

Q. Above or below the mouth of Black River?

A. Above.

4435 Q. Take any one of these cases in 1890, and can you tell whether they received their water supply in the houses from the public water supply of Port Huron?

A. I think they all did, because I know that wells are very scarce. It is very seldom—I don't know when I have seen a well in ten years.

Q. Well now, name one of the four cases in 1890, in which you know now that they received their water supply from the public waterworks?

A. Well there is—in 1890?

Q. Yes sir.

A. Otis Scott.

Q. Was the water of Port Huron filtered?

A. No sir.

Q. It came direct from the St. Clair River?

A. Yes sir.

Q. Is it a tolerably good water supply?

A. It is counted one of the best in the world, but—there was contamination there; that is where we got our fever from.

Q. What is the reason?

4436 A. The upper part of the city extended quite a distance above the intake pipe, and the intake pipe at that time was just on the bank of the river, flush with the dock, and only about five feet below the surface, and contaminated water was constantly coming down from that upper part of the city.

Q. Into the St. Clair River?

A. Into the St. Clair, from the cases that occurred along the eastern slope of the city.

Q. Now do you know whether or not these people in 1890, this man Scott, for instance, and his family, did they drink the water from the public water supply?

A. Yes sir.

Q. Without any kind of treatment?

A. Without any filtering; I think they did. I don't think they had a filter.

Q. Are you quite positive about that?

A. Yes sir.

Q. They didn't filter it?

A. No sir.

Q. Now, you know that of your personal knowledge, as to this particular case?

4437 A. Well, I have been in that house enough to know it as much as I would in my own house.

Q. Did you attribute this case of typhoid fever to the contamination of the water supply of Port Huron?

A. That is the only way I could get it at that time, up to that date, we had been getting it from that source.

Q. And that is the theory upon which you—

A. Yes, that is the theory.

Q. —base your conclusion?

A. And from the wells that had been used way back in years before in the outskirts.

Q. Take another case in 1890 now, in which the person sick received water from the public water supply of Port Huron?

A. Fred Gooding, October 4th to November 1st. Ontario Street near Pine Grove. They received their water from the waterworks.

Q. Any other person in either the family of Gooding, or the other man?

A. Any other member of the family?

Q. Yes, having typhoid fever?

A. No.

Q. Only one in each family?

A. Yes, at that time.

4438 Q. Now you think that Gooding also drank the water from the public water supply of Port Huron?

A. I know he drank water from the public supply.

Q. Can you name another case in 1890, in which the water was taken into the house where the case existed, from the public water supply?

A. Yes, I know this Bunce family didn't have any well. I know their water came from the public supply. They lived just across the street from me.

Q. And you attributed that case to the contamination of the water supply?

A. Well, possibly; you can't tell. These people sometimes go outside the city and get contaminated water elsewhere. You can't swear that they got it from that water, but it is a waterborne disease, and ordinarily it is through the milk or water.

Q. Now whether it was in any one of these cases in 1890 or 1891, directly and decidedly attributed to the water supply—the public water supply of Port Huron, you don't know?

A. It is mere theory; it could not be demonstrated.

Q. Well, in 1891, can you give me the names of the people 4439 who received their water supply—who were sick from typhoid fever,—who received their water supply from the public waterworks?

A. In 1891?

Q. Yes?

A. Let me see now. That is true, I think, both of the Folkers on Miller Street and Quay Street. I think they took their water from the public supply. They didn't have wells; they had to have water from the public supply.

Q. Whether they contracted typhoid fever from the water supply or some other source, you don't know?

A. I couldn't say whether they had been out in the country taking contaminated water out there, or where they got it, only the chances were they could get it in either of those places.

Q. How far from the mouth of Black River is this place called the Fiber Works?

A. About a mile, three-quarters of a mile to a mile.

Q. How many sewers of the city empty into the Black River above the Fiber Works?

A. None.

4440 Q. None at all?

A. No.

Q. Was dredging done in Black River up to the Fiber Works?

A. Yes sir.

Q. In what year?

A. In 1891 and 1892. They commenced in 1891; whether they completed and got clear through to the Fiber Works in 1891, I am not sure, but they finished their job in 1892 I think.

Q. Was this done under Government supervision?

A. Yes sir.

Q. Was there a harbor in Port Huron up as far as the Fiber Works in 1890?

A. Well, up to the Iron Bridge; that is right adjoining the Fiber Works.

Q. For lake boats?

A. Lake boats could go up there, that is, if they could get water enough. Shallow draught boats could go up there any time, but after they dredged it, then they could take up boats of deeper draught.

Q. Which side of the river were these cases, north or south side?

4441 A. Let me see. They were about equally divided, just about. I don't know that one side had a preponderance over the other. I don't think it did.

Q. Did the waterworks system extend on both sides of the river?

A. Yes sir.

Q. And very generally through the town?

A. Yes sir.

Q. How many people do you suppose—how many houses in Port Huron use the water supply—the public water supply?

A. Oh, you could almost say 99 per cent,—90 per cent anyway.

Q. That is very unusual, is it not?

A. I don't know that it is.

Q. In a small town?

A. Well, I don't think it is less than that in Port Huron.

Q. When were the waterworks installed in Port Huron?

A. In 1872.

Q. Were there any wells in Port Huron?

A. There were up to that time.

Q. Were there any afterwards?

A. Well, they disappeared after that, gradually.

4442 Q. So that the water was taken very generally and largely from the public waterworks?

A. Yes sir.

Q. Now have you any idea of the months in 1890, when dredging was done in Black River?

A. What months?

Q. Yes?

A. In 1890?

Q. Yes?

A. I don't think it was done at all in 1890.

Q. Was there any in 1891?

A. I think it commenced—well, I couldn't say whether they commenced in May, June or July. It was some time in the summer months.

Q. In 1890?

A. In 1891.

Q. Was that dredging done in Black River in 1891?

A. It was begun in 1891, and I think it was not entirely completed in 1891,—I think there was some dredging done in 1892; that is my recollection.

Q. What time in 1892 was dredging done?

4443 A. It would be from the—probably the first part of the summer.

Q. Have you a distinct recollection of the time?

A. No sir.

Q. Either in 1891 or 1892, when the dredging was done?

A. The exact time as to day or month, no sir.

Q. You have a general recollection that there was dredging done there both years?

A. Yes sir.

Q. And in the summer months?

A. Yes sir.

Q. Well now, if there was any disinfected—or infected dejecta from typhoid fever patients in the matter dredged, of course you do not pretend to know certainly?

A. No, not as to positive knowledge. We had a theory amongst ourselves, that is all.

Q. How far out into the St. Clair River was this dredged material taken before it was dumped?

A. It was taken and dumped over the shallow places, over the tunnel, or in the deep places, where the tunnel came near
breaking through, and that would be about perhaps two-
4444 thirds of the way across from the American side, along
the line of the tunnel.

Q. The tunnel under the St. Clair River?

A. Yes sir.

Q. Was it there in 1890?

A. Yes sir.

Q. And this dredging was done to aid in the preservation of that tunnel?

A. No sir.

Q. But it was because—

A. Incidentally it was left there for that purpose.

Q. Yes, for that purpose?

A. Yes sir.

Q. And incidentally the dredged matter was used to cover the tunnel?

A. Yes sir.

Q. Was it put in any one particular place, or was it distributed across the river?

A. Well, there was one locality where there was quite a little stretch of it that the tunnel came pretty near the surface of the bottom of the river, and that was put in there. 4445 That is what I was told.

Q. What side of the river would that be on?

A. It would be over on the Canadian side, I think. I think it would be in Canadian water.

Q. It is your impression that the major part of this dredged matter was deposited over in Canadian water?

A. Why, it would look like that. I don't know exactly where the line runs; whether it was in the center or whether there was any special arrangement about it, but I think it was nearer the Canadian side than the American side.

Q. How far above Lake St. Clair?

A. Oh, it is about 30 miles, may be more than that. It is 28 miles from Marine City; it may be about thirty-five or forty miles.

Q. By river?

A. By river.

Q. From the place where this dredged matter was deposited, to St. Clair Lake, it would be about 25 to 30 miles?

A. Yes, it would be all of that.

Q. The St. Clair river is a wide and rapidly flowing 4446 stream, is it not?

A. Yes sir.

Q. And St. Clair Lake is in places very shallow?

A. Yes sir.

Q. In fact the larger part of the Lake is quite shallow, is it not?

A. It is a shallow lake, yes sir.

Q. And where there is a current, it is about the center of the lake, flowing through the lake?

A. The current is along the channel in the lake.

Q. And there is considerable current there?

A. Something of a current; I don't know how much. It broadens out so that the current is very much reduced after it leaves the canal. It goes through the ship canal you know.

Q. Where is the ship canal?

A. The ship canal connects the St. Clair River with the lake up at Star Island.

Q. Is it a canal or is it a channel dredged?

A. Just a channel dredged.

Q. And then at the other side of the lake the river is

4447 called Detroit River, is it?

A. Yes, on the south of the lake, after you go down St. Clair River to lake St. Clair, then through Lake St. Clair to Detroit river.

Q. Now is there a canal or channel dredged in the Detroit River?

A. No sir, I don't think there is. Of course they may have to keep their channel open with dredging. I don't know about that.

Q. Now was St. Clair Lake also dredged to make a channel?

A. Not the whole length.

Q. How much dredging was done to make a channel in St. Clair Lake?

A. I don't know.

Q. Of course you are quite familiar with Lake St. Clair?

A. Oh, I am somewhat familiar with it, yes sir.

Q. And while the current is not so swift as in St. Clair River, there is yet considerable current through Lake St. Clair?

A. Yes sir.

4448 Q. The current of Detroit River is also swift, is it not?

A. Yes sir.

Q. And in order to maintain a channel in the Detroit River there was some dredging done there by the Government?

A. I don't know how much; I don't know where or anything about it.

Q. You don't know as to that?

A. No.

Q. How far from what you would call the mouth of the St. Clair River, across the lake to where the Detroit River may be said to commence is it?

A. It is about twenty miles I think, fifteen or twenty.

Q. Fifteen to twenty miles?

A. Yes sir.

Q. Now there is an enormous quantity of water that flows down the St. Clair River?

A. Yes sir.

Q. And the river is not subject to great floods?

A. No sir, no floods.

Q. Does it vary sometimes in its depth?

A. Oh just with the wind, that's all.

4449 A. It is a strait, that's what it is.

Q. A strait between the two lakes, Huron and Ontario?

A. Huron and Lake Erie.

Q. Erie I meant to say.

A. Yes sir.

Q. Now of course it maintains its level, and in order to do that there must be a very considerable current through it?

A. Yes sir.

Q. Do you know the volume of water, or the flow of that river per cubic foot per minute?

A. No sir.

Q. Do you know whether it is 180,000 or more than that per minute or per second?

A. No sir, I don't know anything about it.

Q. You never studied that matter at all?

A. No sir.

Q. But at any rate whatever the amount of water that goes into Lake St. Clair from the St. Clair river, it is discharged through the lake into the Detroit River?

A. Yes sir.

4450 Q. How far is it from Port Huron to Detroit by river?

A. Oh, about 65 miles.

Q. How far from Port Huron to the intake of the Detroit waterworks?

A. I don't know.

Q. What is the speed of the current in St. Clair River?

A. It varies. At the foot of the lake it is about six miles an hour, and as you get down, it is probably three miles.

Q. In the lake, about three?

A. In the lake St. Clair?

Q. Yes.

A. I don't know whether it is that or not, in Lake St. Clair, it is mere guess work.

Q. Where is it six miles per hour?

A. At the rapids, up at Port Huron, I think it is that at times.

Q. And below the rapids you think it is about three miles per hour?

A. Probably.

Q. Do you know the speed of the current of the Detroit River?

4451 A. No sir, I don't know that.

Q. How does the speed of the current of the Detroit River compare with the speed of the current of the St. Clair River?

A. I don't think it is quite as strong, or rapid.

Q. Is the Detroit a wider river?

A. Perhaps it is a little, but not very much; they are about the same. As you get down towards Lake Erie it is a little wider.

Q. By boat, an ordinary lake boat from Port Huron to Detroit is how long? How many hours?

A. Coming down about—you leave Port Huron about seven and you are in Detroit at noon—five hours.

Q. And up the stream from Detroit?

A. It is about the same, a little more. It may be about four and one-half hours down and five up; I think that would be nearer.

Q. Now on the St. Clair river there is considerable agricultural population on both sides?

A. Yes sir.

Q. Having its natural drainage into St. Clair River?

A. Yes sir.

4452 Q. And Lake St. Clair; there is an agricultural population also?

A. Well, it is where we never see it. It is stretched out so wide. I suppose there are farms along the lake. I presume there are.

Q. Now on Lake St. Clair there are a number of summer resorts and club houses?

A. Yes, on this canal.

Q. Quite a number of those?

A. Yes sir.

Q. So that in summer Lake St. Clair is a kind of a resort?

A. Yes, it is a great resort, fishing, duck hunting, boating and clubs.

Q. Large numbers of people resort there during the fishing and hunting season?

A. Yes sir.

Q. The hunting season commences in March?

A. I don't know.

Q. And the hunting and fishing season continues until after late in November?

A. I don't know a thing about it.

4453 Q. In addition to the people who make that place a resort in summer, there is a large fishing industry on St. Clair River and Lake St. Clair?

A. Well, not much fishing done, except by hand, in Lake St. Clair. At the flats. The fishing industry is up in Lake Huron.

Q. Are there any people fishing with nets in Lake St. Clair and the Detroit River below?

A. I don't think so, possibly; I don't know.

Q. How many people would you say resorted at Lake St. Clair and the St. Clair River in the summer?

A. As resorters?

Q. Yes?

A. I have no idea; it would be in the thousands.

Q. Every day?

A. Probably.

Q. Of course varying with the season?

A. Yes sir.

Q. And varying with the times of the season, would it?

A. Yes sir.

Q. So that any day during that time, in the summer, 4454 there might have been from two to three or four or five thousand people on Lake St. Clair?

A. I don't know that there would be that number on any one day, but it would be hundreds and perhaps more.

Q. These people might as well have had typhoid fever as anybody else?

A. Just as well.

Q. Especially coming from Detroit?

A. Especially if they had been exposed to it.

Q. Detroit has been rather notorious for typhoid fever for many years, has it not?

A. I don't know any particular notoriety in that line.

Q. More than the average?

A. They have had quite a number of cases, and so on down along the river and at Port Huron.

Q. Down along the St. Clair River they have had typhoid fever?

A. Yes sir.

Q. About as regularly as any place else?

A. Yes sir.

Q. Both above and below Port Huron?

A. Yes sir.

4455 Q. And on both sides?

A. Yes sir.

Q. Take the cases of typhoid fever in 1890 were the people who had it engaged in occupations which took them away from home, from their houses I mean?

A. No sir, they were not.

Q. Were any of them engaged in any business?

A. Just wait a moment. They were all home people.

Q. Well, were they engaged in occupations during the day which took them locally away from home, about the city?

A. No, I don't think that there was anything in that line. They belonged right there in the city and consumed the city water and city food. I don't think they were out on the road in any way.

Q. No, but were they people who having houses at one place, would have offices or places of employment at some other place in the city?

A. No sir.

Q. Did they have no occupation whatever?

A. No, there is one of these men that would be at home constantly; he was a driver; he had work down town. He
4456 lived right close to the saw mill and his horses he kept close by there, and he lived right there.

Q. What was he, a teamster?

A. Teamster.

Q. He worked about the city?

A. No he was working about the mill and delivering lumber all over the city.

Q. Now if he took a drink of water during the day at any time, he might have gotten it then at some other place than the water supply of his house?

A. But he would get the same city water wherever he went.

Q. But he might have got it at some other place than his house?

A. I don't care whose house, it would be public water from the waterworks.

Q. Take any of the cases in 1890, were they people at leisure and didn't work about, or who didn't have any employment for a livelihood?

A. Not that I have quoted here, no sir; they were home people tending to business at home, and had no business anywhere else.

4457 Q. That is, they had business in the city of Port Huron?

A. That is what I mean, around the city.

Q. They didn't remain constantly at their houses and drink constantly of the water at their houses?

A. That is right. They did.

Q. And that would be true also of the people in 1891?

A. That is largely true of the people in 1891; I don't know of an exception.

Q. So that any one of them may have contracted typhoid fever from some drinking water derived from some other place than his particular residence?

A. He may have got contaminated water at some other place except his residence, yes sir.

CROSS-EXAMINATION BY MR. TODD.

Q. Doctor, in these eight cases that you have enumerated, four you specified for 1890, and three for 1891?

A. You want the fourth?

Q. Yes, you have seven?

A. Let's see, 1891 has four.

Q. Those you have given.

4458 A. And 1890 has four; just the one that is lacking?

Q. Well, you gave the one in October, one in September and October and one in October and November?

A. In 1890 or 1891?

Q. 1890?

A. Now there is one more wanted in 1890?

Q. In 1890. You gave Scott, Gooding and Massmore, I believe it was.

A. 1890 did you say or 1891?

Q. 1890?

A. Fred Gooding, have you got him?

Q. Fred Gooding.

A. And then here is Mrs. Bunce in 1890.

Q. Yes, that is in October.

A. That is in October; then Massmore in October; have you got that?

Q. Yes.

A. Now isn't that all of 1890,—and Otis Scott?

Q. That makes four.

A. That makes four.

4459 Q. Now in 1891, August and September, John Folkers.

A. H. Mayer in 1891, April and May,—Gillett Street between 12th and 13th.

Q. I have got John McFadgen.

A. He was a railroad man, that is, he was superintendent of the Grand Trunk business in Port Huron.

Q. That is Mayer?

A. No, McFadgen.

Q. What about Mayer?

A. Mayer was a clerk in one of the stores; he clerked at a grocery store.

Q. Among these eight people, did any of them result fatally?

A. Yes sir, Mrs. Bunce and Mr. McFadgen.

Q. Those were the only two?

A. Those were the only two out of that list.

Q. Of these eight patients, how many were attended by a trained nurse?

A. I don't remember.

Q. Were the nurses that had charge of these patients, the
majority of them, typhoid fever trained nurses, or just
4460 nurses within the family?

A. No, most of them were just their own people. For instance, Mrs. Bunce,—her daughter attended to her.

Q. You left directions with the nurses in all these cases for the disinfecting of the dejecta?

A. For disinfection of the dejecta.

Q. For disinfection of the dejecta?

A. Yes sir.

Q. You also left directions with them as to how to attend the patients?

A. Yes sir.

Q. And you found that in matters that came directly under your observation, these nurses carried out your instructions did you not?

A. Yes sir.

Q. And there is no reason for you to assume that they did not carry out your instructions?

A. No sir, I have no reasons to believe that they did not.

Q. In regard to disinfecting the dejecta?

A. The only thing is I know that oftentimes they got care-
less about those things, but that is outside of my knowl-
4461 edge. I don't know whether they did it or not.

Q. Now above Port Huron are there any towns?

A. No sir, not in the neighborhood of Port Huron at all.

Q. Are there any sewers emptying into the Black River above the intake?

A. You mean St. Clair River above the intake pipe?

Q. Yes?

A. Yes sir.

Q. How many?

GENERAL CROW: That is at that time?

MR. TODD: At that time I am speaking of?

A. There has been right along, for years; there has been trouble. As I said a minute ago, we had our water contaminated from sources above the intake pipe.

Q. Was there any place above the intake pipe, exclusive of the sewage of Port Huron, where typhoid infected dejecta could get into the St. Clair River?

A. Any place above the intake pipe?

Q. Yes, exclusive of the sewage from Port Huron?

4462 A. Well yes, there was what is called McNeil Creek. I think that was in existence at that time, but it has been filled up since. McNeil Creek drained quite a territory in that part of the city.

Q. That is just part of the city?

A. That is part of the city, but none beyond the city.

Q. Well, that is what I want to get at?

A. No, none.

Q. What is your theory in regard to the cause of the typhoid that infected the water?

A. You mean any particular epidemic?

Q. No, in these cases?

A. In general?

Q. Yes?

A. Why, the theory that our medical society has had there always has been that we had contaminated water, or contaminated milk.

Q. Well, you can only get contaminated milk by putting contaminated water in it?

4463 A. Yes, that would be one source, but if there are cases of typhoid fever at the dairy, and they get to handling your pails, or perhaps they wash the milk pails with contaminated water. You could have contaminated milk through that source.

Q. What I want to get at doctor, is this; there had to be a beginning of the typhoid in these years, in order to contaminate the water which created the continuance of the typhoid?

A. Certainly.

Q. Now what was the theory of how this original contamination began or did they have any?

A. Why there is no case without a case ahead of it.

Q. How?

A. We never have a case of typhoid fever without a case ahead of it. It comes from somewhere, some person has brought it to a certain locality.

Q. But that wasn't discovered, I mean in this particular instance?

A. No.

Q. So that any contamination from typhoid at Port Huron must originate in Port Huron and get into the water supply of Port Huron. There is no place above there that it could get in?

4464 A. Yes, they might come by rail. You might get cases of typhoid fever into Port Huron in a great many ways.

Q. I know; I am not speaking of that, about its being imported in, I mean it must be within the city limits, the confines of Port Huron, getting into the water supply and drinking it, because there are not any cities above Port Huron?

A. No, there is no city above. It must come from the town itself, any contamination of the water there.

RE-DIRECT-EXAMINATION BY GENERAL CROW.

Q. Doctor, you are not an expert on stream flows and the volume of its flow?

A. No sir.

Q. What you said about the rapidity of the current of Lake St. Clair and the St. Clair River is mere—

A. Guess work; I don't know a thing about it.

Q. —guess work?

A. Yes sir.

Q. How long has typhoid fever existed to your knowledge, in Port Huron?

A. It has been there ever since I have been there.

4465 Q. How long has that been?

A. I have been there 33 years.

Q. Thirty-three years?

A. Yes, 32 years last December.

Q. Doctor, I will ask you if in your judgment as a physician, the disinfectants that are applied to stools of typhoid fever affected patients always destroy all of the bacilli, entirely?

A. No sir.

RE-CROSS-EXAMINATION BY MR. TODD.

Q. I believe you stated that you gave instructions to use hot boiling water?

A. Yes sir.

Q. Will that kill the typhoid bacillus?

A. If it is done thoroughly, it will.

Q. By "thoroughly" what do you mean, doctor?

A. I mean that if they pretend to use boiling water, sometimes before they get through with it, it is put in, perhaps a cold vessel, and the dejecta is cold, and the whole business is not as hot as required to kill the germs. If boiled long enough.

4466 Q. When hot water is not employed, what disinfectant did you use?

A. Carbolic acid and copperas.

Q. Well, will carbolic acid destroy the germs of typhoid fever?

A. I think it will kill it at the time.

Q. That doesn't require to be heated does it?

A. No.

Q. If your instructions were carried out, what reason have you to assume that it would not kill all of the germs?

A. Well, the question was, as ordinarily used, would it? I think that is the question.

Q. Let me change my question then. What do you understand the meaning to be "as ordinarily used"?

A. Well, in ordinary practice it is used thoroughly sometimes, and sometimes not. That is the point.

Q. But if it is used in the manner in which you prescribed it to be used—

A. Why, then it did kill them—it ought to destroy the germs.

Q. And wherever it was, you don't know that it was used in that method?

A. No.

4467 Q. By GENERAL CROW: Your experience as a physician, however, leads you to believe it was not used as it should be?

A. That they did it with a great deal of carelessness.

HIRAM R. MILLS.

4463 **CHARLES B. STOCKWELL,**

called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Attorney-General Crow and testified as follows:

Q. Give the stenographer your full name, occupation and address?

A. Physician and surgeon. My name is Charles B. Stockwell. Address, Port Huron, Michigan.

Q. How long have you lived in Port Huron?

A. Fifty-one years.

Q. Fifty-one years?

A. Yes sir.

Q. How long have you practiced medicine?

A. Twenty-four years—23 call it. I don't know as it is quite 24.

Q. Were you practicing medicine in Port Huron in 1892?

A. I was.

Q. Do you know whether or not there was any typhoid fever cases in Port Huron in 1892?

A. There was.

Q. Of your personal knowledge, do you know how many there were? 4469

A. From personal knowledge I have a record of three.

Q. What months of 1892 was that?

A. February, March and April. One of these cases extended into May, beginning in April—April 3rd.

Q. Do you know whether or not any of the houses in which these patients were sick, had a connection with the drainage, directly or indirectly, into the Black River?

A. In two of these cases. In one case I know there was direct connection with the Black River by private sewer, and in another one there was direct connection with the St. Clair river, but not direct connection either—I believe it was through one of the sewers—I don't remember.

Q. It was a sewer, was it?

A. Yes, it emptied in near the waterworks which has already been spoken of. The other one, the house was located on the border of Indian Creek, which emptied into the Black River; whether there was a sewer there or not, I can't tell.

CROSS-EXAMINATION, By Judge Johns.

Q. In one case there was sewage directly into the Black
4470 River by private sewer, was there?

A. Yes sir, by private sewer.

Q. Now was this case personally attended by you?

A. Yes sir.

Q. Was the sewage disinfected?

A. It was not that I remember. It was simply turned into the hopper.

Q. Did you give instructions to have it disinfected?

A. I don't—I did not that I remember.

Q. Was that your practice or custom?

A. At that time it was, where it could be easily flushed right into the sewer. I wouldn't say that I would do it now.

Q. You don't remember as to that one case having sewage into the Black River, whether you caused the sewage to be disinfected or not?

A. I am quite certain not. I had the case after it had been running for a week, but as far as I remember, I didn't say anything in particular about disinfecting.

Q. But the particular case having indirectly a connection by sewerage with the St. Clair River, where was it in the
4471 city of Port Huron?

A. Just at the lower border, or southern border of the Park, which is within 200 feet of the river.

Q. Of the St. Clair River?

A. Of the St. Clair River.

Q. And was there a public sewer leading from that house to the St. Clair River?

A. Yes sir.

Q. Below the intake or above?

A. Below the intake.

Q. How far would the mouth of the sewer in the St. Clair River be above the Indian River?

A. Above the Black River you mean?

Q. Above the Black River?

A. It would be I should think, a little over half a mile.

Q. The current of the St. Clair River would carry that sewage, if deposited from the sewer, past the mouth of Black River?

A. It would, except at this point there was an eddy, and I have no personal knowledge though, but there were
4472 experiments that were carried on to find whether any of that sewage could get into the water supply. I know experiments were made, but I have no personal knowledge, so I say nothing about it.

Q. As to the result of the experiment?

A. As to the result of the experiment, no. I know the water was carried up pretty close to that intake pipe.

Q. Now the other two cases, the second case in 1892—where was it?

A. The other one was on Court Street, the one that was on the bank of Indian Creek.

Q. Where was the dejecta of that patient deposited?

A. By the way, that was not my patient originally. I saw it two or three times. The patient that my father attended—who is now dead—he was unable to attend a few times so I looked after the patient for him.

Q. Where were the discharges from that patient deposited?

A. That I am not quite certain about. He had charge of that.

Q. As to whether it was disinfected, do you know?

A. I knew nothing about that, because I was simply asked to go in and see how the patient was doing.

4473 Q. Whether the discharges of that patient went into out houses or into Indian Creek, you are not certain about?

A. I would not be certain. I know it was on the bank of the stream, but what was done with it, I don't know.

Q. Now the third case in 1892, where was it? You gave one near the St. Clair River.

A. Oh yes, the other was within 200 feet of Black River, just above what is called Seventh Street Bridge.

Q. Is that above or below the fiber works?

A. That would be below the fiber works.

Q. Was there sewer connection with the house in which that case existed?

A. It was connected with a private sewer.

Q. To the Black River?

A. Yes, emptied right into Black River.

Q. Now do you know whether the discharges of that patient were disinfected?

A. I think they were not, I don't remember of ever telling them. They were just simply taken immediately to the closet and flushed out.

Q. What time in 1892 was the first case?

4474 A. That would be February 6th.

GENERAL CROW: Which case was that?

A. February 6th was the one on the bank of Indian Creek. February 10th I was called to see the case on the bank of Black River, near Black River; but that had gone on a week before I was called.

Q. JUDGE JOHNS: And the third case?

A. The third case began April 3rd. That was up near the waterworks, at the lower end of the park.

Q. None later than that?

A. None later.

Q. I have used the term here with the former witnesses and with yourself, of "dejecta." Do you understand that to mean also the urinary discharge?

A. Yes sir.

Q. In a general way?

A. Yes sir.

Q. There was no Board of Health in Port Huron at that time.

A. I think so, but it could hardly be dignified by that name I guess.

Q. It wasn't in very good order?

A. Not at all, no. Really, as far as I remember, very little work was done in fact. 4475

Q. Such statistics as were gathered with reference to deaths and the causes of them, were gathered by the supervisors, as Mr. Mills testified?

A. I think so. As I remember, they were never gathered at all. The only thing I know the Board of Health doing at that time was to collect cards upon which physicians wrote the kind of cases they were treating. I think that is all that was done.

Q. And no public record made of that?

A. Not that I know of. I have never been able to get trace of any.

Q. Do you understand, doctor, that a person having typhoid fever may have typhoid fever germs in his system for a very considerable time after he is apparently cured and healed?

A. I am sure I know nothing about it.

Q. You don't know as to that?

A. No.

Q. You don't know whether the typhoid bacillus is found in the discharges of human beings for months and years after recovery from typhoid fever?

A. No. I am ignorant regarding that.

4476 CROSS-EXAMINATION, by Mr. Todd.

Q. Doctor, were these the only cases you had in 1892?

A. Yes, in those months. All I was asked to look up was for February, March and April, so that is all that I have made a record of. I think there are other cases that I have had.

Q. But these are all that you recollect now, for 1892?

A. These are the only ones, because those are the only ones that I looked up for those three months.

Q. Typhoid fever was not prevalent in Port Huron at this time, was it?

A. Yes, it was prevalent there.

Q. Well, no more than ordinarily is the case in any town of 15,000 or 16,000 inhabitants, is it?

A. Yes, it was more prevalent at that time. I remember that distinctly, that anyhow, that is my impression, that it was much more prevalent.

Q. But these three cases are all the cases you know of?

A. Yes sir.

CHARLES B. STOCKWELL.

4477 **OLIVER STEWART,**

called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Attorney-General Crow and testified as follows:

Q. Please give the stenographer your name, occupation and address?

A. Oliver Stewart, physician; Port Huron, Michigan.

Q. How long have you lived in Port Huron?

A. Sixteen years.

Q. How long have you been practicing medicine?

A. That same length of time.

Q. You were practicing medicine there in 1889, 1890 and 1891?

A. I was.

Q. Do you know whether or not there was any typhoid fever cases in 1889, 1890 and 1891 in the early months of 1889, 1890 and 1891 in Port Huron.

A. I do.

Q. Of your personal knowledge, how many cases do you know of during those years?

A. Well, I will have to refer to the notes for that, to get the exact number. (Witness refers to memorandum.) In 1889, I had five cases—In August I had three cases—

4478 Q. August, 1889?

A. In August, 1889; I had one in September and I had one that ran through between October and November. It was partly in those two months.

Q. Now what did you have in 1890?

A. I had five cases in 1890. I had four in one house, in September running into October, in 1890, and I had one case on 9th Street between Howard street and Pine.

MR. TODD: What month?

A. That month—well that year, it was in September. That case on 9th Street was in September, 1890.

Q. GENERAL CROW: How many cases did you have, doctor, in 1891?

A. I had four. I had one in September that ran into October, then in October I had three other cases, one of them being a tramp at the hospital.

Q. You had five, you say in 1891?

A. I meant to say four.

Q. Now did any of these patients, or the houses in which they were located, have any sewer connection?

A. Let's see. One I know did, but I am not positive that
4479 any of the rest—yes, there is two. Now just wait a minute. That last one I am not so sure about that. I fancy that that one did, but when I think of it, I cannot say positively that that one did have any sewer connection. I think Mr. Rogers would probably be able to settle that.

Q. Well, give us the location?

A. It was over at the end of Pleasant Street. That was in 1891.

Q. Now, where are the other cases located?

A. In 1891?

Q. Yes.

A. Then there was one on 13th Street, 13th and Miller Streets.

Q. Right close to Indian Creek?

A. Well, the waterfall, there is a little swail runs down from that place and drains into Indian Creek. I don't think there were any sewers there at that time.

Q. Well, where were the other two located?

A. Well, the one that I mentioned was at the corner of Lepear Avenue and 12th Street, and the other was at the hospital, the tramp. Well, I didn't get him there. I had him
4480 sent there as soon as I was called.

Q. Is that connected with the sewer?

A. I believe the hospital was connected with the sewer at that time.

Q. How many physicians were there at that time—1889, 1890 and 1891, practicing in Port Huron, just approximately?

A. You mean the regular—

Q. Yes.

A. I think there was about twenty, as near as I can remember, at that time. I am speaking of just the regular physicians.

Q. Well, other physicians besides yourself had cases of typhoid fever?

A. Oh yes.

Q. You know as a matter of fact then, of your own knowledge, that there were other cases of typhoid fever in Port Huron besides what you attended?

A. Yes sir, I know that I saw some that other physicians attended.

CROSS-EXAMINATION, by Judge Johns.

Q. Who were these people in 1889; can you give the names?

A. Yes, one was a Mistress Joiner, a wench, poor, very poor.

4481 GENERAL CROW: What did you say, a wench?

A. Yes, a colored woman.

Q. JUDGE JOHNS: Did she have sewerage connection with her house?

A. I don't know. I don't think so; that was on 11th and Miller. I don't know about the sewers at that time there.

Q. What month was that?

A. That was in August, 1889.

Q. What was the name of another one in 1889?

A. I had one case, Gilbert Rogers and wife. They lived not just on the corner, but the next house, I guess, to the corner, of Gillette and 11th.

Q. Were they well conditioned people?

A. Not particularly, no. That house I am pretty sure was not connected with a sewer. They had water. They got their water from a hydrant.

Q. Did you give orders to have the discharges of Mistress Joiner disinfected?

A. Yes, I mentioned it to her, but the neighbors used to go in and give her a drink of water occasionally. I would contrive
to call around once or twice a day. I fixed those a
4482 number of times, so that I know some of those stools
were disinfected, but others I haven't the slightest idea—
I don't think they were.

Q. Now in the case of Rogers and his wife—

A. His sister took care of them and I gave them the tablets and told them what to do with them. That is as far as my—

Q. But what they did, you don't know?

A. Yes, what they did I don't know.

Q. Now then, the other two in 1889?

A. In the case of Spade, I think that was done. His wife took care of him. She was a careful German woman, and had instructions to do it, and told me she did do it. I don't know any further than that.

Q. Now the fifth one?

A. Proctor. He had a man nurse, he was not a trained nurse. By the way, I might say that at the time we had this epidemic of typhoid fever in Port Huron, I don't think there was more than one—possibly two—I don't know whether there were any trained nurses in Port Huron. In looking over my cases I only know of one that had a trained nurse, and that was imported from Detroit.

4483 Q. In 1889, this person Proctor?

A. Yes sir, this old man said that he did too; he said that he used the tablets, but I don't know whether he did or not. He was a failure as a nurse.

Q. Did the man Proctor die?

A. He did not.

Q. In 1890, who were some of them?

A. I had one girl, a particularly strong girl. Her name was Correy. I don't know that I could say just what the girl died of. We held a post mortem on another patient and it resulted that he had thrombosis of the medulla—the other patient had, and she had practically the same symptoms. This girl was on 9th Street. Her sister took care of her; was very assiduous, and they were in very medium circumstances.

Q. And you left the material to disinfect the discharges?

A. That was a standing thing with me. It was a thing that I had impressed upon me by one of my professors and I always did it.

Q. Now the other four or any one of the other four—let me ask you, Miss Correy, when was her sickness?

A. That was in September of 1890.

Q. Now another one?

4484 A. Now these four cases that I had in one family were three boys and one girl. I think the eldest one was about eighteen, and they went from that down. They were all just about alike. There wasn't very much difference. One of them was sick longer than the others with some stomach trouble, but they were practically the same.

Q. Did their discharges go into the sewer or was it disinfected?

A. Those discharges went into a closet and the instructions were left, but I don't know—probably, I think they were carried out. I know some of them were because I saw the water that they told me they put that in when the stools were made, because there was so many there. I was there a great deal of the time and I was there sometimes when those bowels moved.

Q. You think their practice was to disinfect?

A. I think it was.

Q. That constitutes the five cases in 1890. Now in 1891, four cases, who were they?

A. One was a boy about 19, on 13th and Miller Streets. The same instructions were given there. I think they
4485 were carried out. His mother took care of him, and she was both industrious and faithful.

Q. And it would be your best judgment that the discharges from that patient were disinfected?

A. I think most of them were.

Q. And the other three?

A. This one, the girl on the corner of Lepear Avenue and 11th Street, I am very certain was, because her mother took care of her. They were a very intelligent family and I believe they followed instructions.

Q. Now then this third case?

A. That one, her mother took care of her and I think I can say the same thing for her.

Q. And the fourth one?

A. That was the tramp in the hospital. That hospital—probably you gentlemen may get the wrong idea of that hospital. I have seen at that time, or either that year or before, I have seen the matron of that hospital doing her washing in the hall and chickens going through there, so I have not the slightest idea whether that was done or not. She had instructions to do it, but I haven't any idea about it. That is a dirty thing to
4486 say about our hospital, but it is the fact just the same.

Q. Whether the sewage discharges were disinfected at the hospital you don't know?

A. I don't believe they were. They may have been. I don't believe it though.

Q. What time in 1891 was this case at the hospital?

A. In October.

Q. Do you know the history of that case—where the man contracted the fever?

A. I haven't the slighest idea. He had been running around the country and struck a friend there and was taken sick at his place.

Q. And removed to the hospital?

A. And as soon as I was called, I sent him to the hospital. I think there were others that had more cases. I am sure there was there.

CROSS-EXAMINATION BY MR. TODD.

Q. Doctor, in regard to any other cases of typhoid that you know of as existing there, except those which came under your personal supervision, you got from hearsay, from the doctors who attended them?

A. Yes, or got them in discussing them in the societies.

4487 Q. Was it not the general practice among the doctors in Port Huron to prescribe that the excreta of patients should be treated in the manner that you have described?

A. It is only fair to say that that wasn't done nearly so much then as it is now. I couldn't say postively much about that. I know some did not and I know some did. I am speaking now of what they told me.

Q. That is what I mean?

A. Some of them told me that they always did and some did not.

Q. I suppose that among these 22 physicians that are practicing in the regular school there are all grades of doctors?

A. Yes sir.

GENERAL CROW: You are speaking of thirteen years ago now?

MR. TODD: That is what I am speaking about now. They had the same grades then that they have now?

A. Yes sir.

Q. And among the typhoid cases that would be treated, they would be treated mostly by the best class of doctors, either originally, or called in subsequently?

A. That was a good deal so, yes, but there were some men there that were not strictly regular, and they had some
4488 cases. At least they said so. I couldn't swear to that.

Q. You speak of "regular;" what do you mean by that?

A. I mean any man graduated from a distinctly recognized medical college.

Q. And do you apply that to eclectics, allopaths and homeopaths, or strictly to one of the schools?

A. Well we don't, as a rule, among physicians, we don't recognize eclectics or homeopaths as regular men,—not as a rule. There are some doctors who are graduated in homeopathy, but they get to reading after they get out, and they don't use it now. That man, I wouldn't want to say that he was irregular, because he is honest in his convictions, and he uses the regular books and says he practices regular medicine and I have no reason to doubt him, but a straight homeopathist, I shouldn't class him a regular physician.

Q. And how would you class them?

A. Well, I really think that a homeopath—that there are some honest men, even among the homeopathists. I think the trouble was with the men—I can hardly think of a man with good judgment—now this is my own opinion—I can't understand a man with good judgment, embracing that sort of a thing.

4489 Q. How many homeopathists are in the practice in Port Huron?

A. Well I only know—I can only think of two just now. Dr. Lewis graduated as one, but he said is was a matter of expense a good deal. Says he doesn't use it and doesn't practice it now. I think there are only two besides him.

Q. And did you count those two in the regular school?

A. No.

Q. Do you know how many public, well regulated and well governed hospitals in the country that are open to the two schools of medicine,—homeopathy and allopathy?

A. I didn't know that any of the hospitals excluded homeopathists.

Q. I mean where departments are set aside for them, where the treatment is given in one department, allopathy, and the other is eclectic?

A. Really, I don't know. At Ann Arbor there are some few chairs of homeopathy; I don't know how many. I don't know about that.

Q. If an examination of those statistics should show to you that the percentage of cures in the homeopathic wards
4490 excelled those in the allopathic wards, would that have any effect upon your judgment as to homeopathy and the people following it?

A. I don't think it would. I would question the diagnosis probably.

Q. If in the Cook County Hospital in Chicago, which is one of the largest in the country, it was acknowledged by the allopathic school, that the homeopathic made the best showing in their treatment of typhoid fever patients in the hospital, would that have any effect upon you—and the records showed it,—as to whether—

A. Now I would still question the diagnosis a good many times.

Q. How do you diagnose typhoid fever, doctor?

A. Well, by the symptoms.

Q. What are the symptoms of typhoid fever?

A. Well, coated tongue; feeling of lassitude; tired and lack of ambition; loss of appetite; possibly in the first stages, of constipation and a general bad feeling. Nothing very definite.

Q. Are those the symptoms that in the first stages you would diagnose a case of typhoid fever from?

A. I might be able. There are other things that simu-
4491 late those things very closely.

Q. What different diagnosis would the so-called grippe have from the diagnosis that you have just given for typhoid fever?

A. Much quicker. A grippe case is quicker and the symptoms are not the same. You generally have a high fever quicker than you do in typhoid. You have a more intense aching. The symptoms are more acute altogether.

Q. Is epi-taxis an indication of typhoid fever?

A. It is one of the symptoms in some cases.

Q. Are there any rashes break out on the stomach as an indication of typhoid fever?

A. We almost invariably have some of that.

Q. How long has a typhoid fever case to be in existence in a patient before you can ascertain definitely that the patient has typhoid fever?

A. It is very difficult to determine definitely when it started. It depends—some of them, the diagnosis can be made positively earlier—I am speaking from the symptoms now—can be made much earlier than they can in others.

Q. Are the symptoms that you have related the symptoms that are relied upon by the advanced thought and knowledge of the regular physicians?

4492 A. They have to be.

Q. Isn't the blood test the accepted test now among physicians for diagnosing typhoid fever?

A. No sir, not positively.

Q. And has not that test been developed within the last two years for the purpose of ascertaining the presence of the bacteria of typhosus in the blood, and has it not been pronounced the only real, true test for typhoid fever?

A. In a great many cases the typhoid bacillus cannot be demonstrated in the blood.

Q. Do you consider the typhoid fever bacillus a consequence or a cause of typhoid fever?

A. I think typhoid fever is a consequence of an infection of the typhoid bacillus.

Q. Now in disinfecting the excreta of a typhoid patient, what disinfectant did you employ?

A. Bichloride of mercury.

Q. Among these cases that you have given us an account of, how many would you say the excreta of which emptied into the sewers?

A. Well, sir, I believe there is only two, the tramp and

4493 one other.

Q. What is your opinion as to the effect of bichloride of mercury upon the germs of typhoid fever, as to whether it destroys them or not?

A. I believe in a strong solution, say about one per cent solution, I believe it would kill the germs. Now I want to qualify that. Now, I don't know postively that that is the case. In my opinion it will do it.

OLIVER STEWART.

ADJOURNED until 2:30 P. M. same day, Saturday, June 22, 1903.

4494 Southern Hotel, St. Louis, Missouri. 2:30 P. M., Saturday, June 22, 1903. Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

FRANK F. ROGERS,

called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Attorney General Crow and testified as follows:—

Q. Give the stenographer your name, occupation and address.

A. Frank F. Rogers; civil engineer. Port Huron, Michigan.

Q. How long have you lived in Port Huron?

A. Since June, 1890.

Q. How long have you followed the business of civil engineer?

A. Twenty years.

Q. Twenty years?

A. Yes sir.

Q. Are you familiar with the location of Port Huron?

A. Yes sir.

Q. What is its topographical situation there with reference to the Black River and the St. Clair River?

A. Well, Port Huron is situated on the west bank of the 4495 St. Clair River and is intersected by the Black River which flows through the city in a southeasterly direction, dividing it into nearly equal halves so far as population is concerned, and there is a limited area of territory adjacent to St. Clair River which slopes direct to the river, not exceeding five or six hundred feet in width. I think the most part of the rest of the topography of the city drains gradually to Black River from each side of Black River. There was one stream flowing into Black River, called Indian Creek, which flowed through the south half of the town in a northeasterly direction and emptied into Black river at a point approximately half a mile from the outlet of Black River.

Q. That was a small stream?

A. A small stream known as Indian Creek, although it had well defined banks. It is not shown on the map. It had well defined banks, and in some portions it had bottom lands a couple of hundred feet in width. In other places less than that and quite a little area of territory tributary to that sloped directly to it. The highest part of the city is about 20 feet to 25 feet above St. Clair river, and the main business street of the town which is fairly up on the highlands, running north and south, inter-
4496 secting Black river, is from 12 to 20 feet above the water in St. Clair River, both ways sloping towards Black river.

Q. Now what is the character of the Black River. Is it a rapid or sluggish stream?

A. It is a very sluggish stream in most seasons of the year, having no perceptible current except during the spring freshets or excessive rainfall.

Q. What is the character of the bottom of the stream; is it mud and silt or gravel?

A. Well the native soil is sand and clay, having a little gravel and a good deal of silt is washed into it from above.

Q. Now do you know where the water intake of the city was situated in 1890?

A. Yes sir.

Q. And in 1891 and 1892?

A. Yes, sir.

Q. Whereabouts with refrence to the town, and in what streams?

A. It was on the north side of Black river, on the west side of St. Clair river, on the east side of what we call Pine Grove Park. It would be a little over a mile north of the mouth of Black River measured along the shore of St. Clair river.

4497 Q. Now which way does the St. Clair River flow there?

A. It flows in a southerly direction.

Q. In a southerly direction?

A. Yes sir, nearly south.

Q. Now at that point where the intake was, where was the intake situated in the center of the stream, or was it situated close to the shore?

A. It was situated close to the shore. There is a dock extending out from the bank perhaps fifty feet—that is just a guess, but I am very familiar with the location as near as I could estimate it without measuring it, and the intake was just at the edge of the dock.

Q. Now was there any out-fall for the city sewers up the river above that intake?

A. There were no city sewers there. There was a sewer from Block I shops—no, pardon me, sir, what we call the Grant Locomotive Shops, which discharge sewage of a considerable population at times. The city was always given to understand that it was not used as a regular sewer for feces, but I know it was used for urine, and I am suspicious that it was used in other cases at times.

4498 Q. And that was above?

A. Yes, that was even above anything that shows here (referring to blueprint). It was perhaps half a mile above the waterworks.

Q. Now the territory that lies north of the point where the intake is, the surface of that territory would naturally drain by washings of rain,—would that be into the river?

A. Well, north of these shops?

Q. No, not north of the shops, but north of the intake?

A. Well, there would be only a limited portion of it. The banks are quite high, right up to the river here, without any decided slope to St. Clair river from the waterworks north, until we get up to where a creek known as McNeil Creek used to enter St. Clair River, and then the natural flow is along that creek bed.

Q. And thence into the river?

A. And thence into the river in a southeasterly direction.

Q. Now are you familiar with the condition of the water front there?

A. Yes sir.

Q. Were you in 1890?

A. Yes sir.

4499 Q. Do you know whether or not there was any deposits of sewage from the city of Port Huron, into the Black River in front of and adjacent to the wharves and docks there in 1890, 1891 and 1892?

A. Yes sir.

Q. Do you know whether or not that was ever removed?

A. In Black River?

Q. In Black River, yes?

A. Do you mean deposits on the banks?

Q. No, in the river?

A. Why, it was removed by dredging.

Q. When?

A. In 1892, partly. I think there was a little dredging done in the fall in 1891, or the fall of 1891. The principal dredging was done in 1892.

Q. Who did it,—the government?

A. The United States Government.

Q. What was the object of it?

A. Why, as I understand it, the appropriations were secured through the influence of local congressmen for the benefit of shipping facilities along the stream, and also on account of making a winter harbor for vessels. 4500

Q. Was that the object of it there at Port Huron?

A. Yes sir.

Q. Was there much of this sewage and debris removed from the bottom of the river?

A. Well, the channel was deepened at that time from the neighborhood of twelve feet to sixteen feet and to the width of 100 feet in the central portion of the river.

Q. Do you know where this material was dumped?

A. It was dumped in St. Clair River.

Q. Were there any sewers in the town of Port Huron in 1890, 1891 and 1892?

A. Yes, there were about ten miles—well, in 1892 there were more than that. In 1891 there were approximately ten miles and two miles were added in 1892.

Q. Where did these sewers empty?

A. There were two sewers—

Q. Well, generally they emptied into Black River?

A. Into Black River, yes sir, all of those sewers that I speak of.

4501 CROSS-EXAMINATION BY JUDGE JOHNS.

Q. How far from the mouth of Black River is the point known as the Fiber Works or Iron Bridge?

A. Well, approximately a mile and three-quarters, measured around the river.

Q. How far up the stream did the Government dredge?

A. They dredged to Washington Avenue, which is just the north boundary of the Fiber Works property.

Q. A channel 100 feet wide?

A. The channel was dredged 100 feet wide—not to that point as I remember, but to a point above Suffern Street, and fifty feet wide from there above. That took it through the built up portion of the city.

Q. Now the dredging was to deepen the channel of the river from an average of about twelve feet to an average of about sixteen feet?

A. Yes sir, that is to the best of my knowledge of its previous depth, that is I know it in places.

Q. How many sewers empty into the Black River east of Suffern Street?

A. Well, there is one empties in at Suffern Street, but 4502 there has been some built since that time; but at that time all of the sewers emptied into Black River at and below Suffern Street.

Q. How many were there?

A. There were six large sewers, not counting some private sewers that I haven't any record of.

Q. In 1890, what proportion of the public of Port Huron emptied their household sewage into the sewers?

A. Well, that would be a mere guess. At that time the best residence sections of the city were accomodated with sewers and outside of that the sewers were scarce. I would think it would be less than one-quarter.

Q. Of the total inhabitants?

A. Yes sir, I would say less than one-quarter.

Q. And the larger part of that from what you would call the better residence portion of the town?

A. And the business.

Q. And the business portion?

A. Which of course, includes some of the poorer residents.

Q. The principal part of the dredging was done in 1892?

A. The principal part.

Q. What part, if any, was done in 1891; how much, would
4503 you say?

A. Well, I have no definite knowledge as to what was done in 1891. I think there was a little done near the outlet of the river in 1891. I have not so distinct a recollection of that as of the other. I was in charge of street work along the river and that year we had quite a serious epidemic and there was more or less talk about it, and it is fixed on my mind more than what happened previous.

Q. What time in 1892 did the dredging commence in the Black River?

A. It began in April.

Q. How long did it continue?

A. Why it continued through the summer season; I don't know just when they quit.

Q. Was it continuous or carried on at intervals?

A. Well, it was I think, practically continuous. I haven't any recollection of any cessation of the work.

Q. What was done with the dredged material?

A. It was dumped into St. Clair River.

Q. Loaded onto scows?

A. Loaded onto scows and taken out into the river and dumped from the bottom of the scows.

4504 Q. Could you state what month the dredging commenced?

A. It commenced in April.

Q. What time in April?

A. I couldn't give it to you sir; I haven't looked it up recently.

Q. Nor when it ended, you couldn't tell?

A. No, I couldn't tell you.

Q. Is the Black River a navigable stream for lake boats without dredging?

A. Well I suppose it was at an early day, but it would not be for lake traffic of today.

Q. The ordinary lake boats of today or of 1890, couldn't go very far up the Black River, I suppose?

A. Oh no, not without this dredging.

Q. And it is an extremely sluggish stream?

A. Very sluggish indeed.

Q. Are there manufactories along the banks in Port Huron?

A. Well, the most important manufactory is the Fiber Works referred to. There is a ship yard—are you asking this at that time, in 1891?

Q. Yes, in 1890 and 1891?

A. Well, the most important at that time was the Fiber
4505 Works. In fact, it is the only manufactory of very much
importance that was then right on the banks of the river.

Q. What did it deposit in the river; what kind of refuse material?

A. Why, it deposited—the water that comes from their process of manufacturing paper pulp,—it is mixed with a large amount of acid I suppose. I don't know very much about the chemical contents.

Q. Well, it makes a yellowish looking fluid?

A. Well I have seen it. It never attracted my attention as being particularly yellowish. It is dirty.

Q. Is it discharged in considerable quantities?

A. Why, quite large quantities. I don't know exactly what their water consumption is.

Q. Well, there are no fish in Black River from the mouth up to that Fiber factory, are there?

A. Well, there are such fish as German carp, they seem to be able to live in it, and some catfish.

Q. But the ordinary lake fish do not live in it?

A. No, they don't seem to like the waters.

Q. Where is the strip which drains into the St. Clair River, naturally?

4506 A. Well, the principal part of the strip that I refer to is south of Black River and commencing just east of Military Street there was low land in what was the Pere Marquette Railroad Yards here, which is perhaps seven or eight feet above the water in St. Clair river as compared with an elevation of fifteen or twenty feet on the Main business street.

Q. And how long is that strip which drains into the St. Clair River?

A. Oh, there is half a mile there on that side of the river.

Q. Six or seven hundred feet wide?

A. In some places. Less in others. That would be about the widest part.

Q. Average five hundred feet?

A. Why, perhaps, between four and five hundred feet would be a fair average.

Q. That was taken up by railroads?

A. Principally by railroads, railroad warehouses and elevators and things of that kind.

Q. Was it at that time, in 1890 and 1891?

A. Yes sir.

4507 Q. And did no part of the surface of the ground above the Black River inside the city limits and north of the Black River drain into the St. Clair River?

A. Yes, in a natural state, there was a small strip of land that—well it drained to the east and to the south. I presume that the streets laid out as they are, more of it reaches Black River than directly into the St. Clair, but in a natural state there is a little strip of land until we get up to near the waterworks, where there is not much of any slope toward the lake, but for half a mile or a little more there is a general incline in a southeasterly direction.

Q. So that part of the surface waters—

A. Would go to St. Clair and part to the Black River.

Q. Where were the sewers in Port Huron in 1891?

A. There was a sewer on Huron Avenue, that is from Black River north to Park Street.

Q. What would that distance be, about?

A. About one-quarter of a mile. There was another sewer emptying into Black River at the same bridge on the south side on the main business street, extending a little south, then west to an alley, between Military and Sixth Streets, and thence south, being a total length of somewhat over half a mile.

4508 There was a sewer on 7th Street emptying into Black River at Seventh Street Bridge and extending south, well between a half and three-quarters of a mile, or nearly three-quarters of a mile. There was also another sewer in there right beside this one which extended a little south, then westerly on Lapear Avenue to Ninth Street, and south to Division Street, about a mile in length. There was a sewer emptying into Black River at the mouth of what formerly was Indian Creek, extending in a westerly direction to 10th Street up the Creek bed; thence west on Miller street to 12th street; thence south to Griswold street, being somewhat over a mile in length. There was another sewer emptying in at Suffern Street extending easterly on Suffern Street to 10th Street; thence north on 10th Street to the limits between what used to be called Fort Gratiot and Fort Huron. That was somewhat over a mile in length, and there were two sewers—well, there was one sewer with branches, yes, two sewers with branches emptying directly into St. Clair river. There were three—

Q. How long were they?

A. Well, the total length of those sewers—I haven't the total length of all the branches, but they would aggregate two or three miles perhaps.

4509 Q. Or three?

A. Perhaps, or three.

Q. What character of sewers were they, tile or constructed of brick?

A. All of the sewers that I am referring to as emptying into Black River were brick sewers.

Q. And those emptying into the St. Clair?

A. There was one brick sewer with one brick branch; the others were tile.

Q. What was the population of Port Huron in 1890?

A. Why, I don't know definitely, but it was somewhere between fifteen and twenty thousand I suppose,—probably seventeen or eighteen thousand.

Q. As the sewers existed in 1890 and 1891, what proportion of the population did they actually reach, what fraction of the population did they actually reach?

A. Well, practically all of the main sewers were constructed after the building of the two long sewers that were built in 1891. There were a number of branches that had to be built afterwards to reach the whole population. Of course they immediately only reached the population that was adjacent
4510 to them. I would estimate roughly, if all of the buildings were connected at that time, that could have been connected, perhaps fifty per cent.

Q. Fifty per cent of the population?

A. Yes sir.

Q. In 1890 and 1891?

A. Yes, I am talking of 1890 and 1891.

Q. Now, of the people who could have been connected, what per cent were not?

A. Well, that is very difficult to tell.

Q. What is your best opinion about it?

A. Well, I would state, in my opinion probably not more than twenty-five per cent of the total, but I don't think not to exceed 25 per cent of the whole population could have been having sewer connections.

Q. Now your two principal sewers were built in 1891?

A. That is the two longest sewers.

Q. They were the main sewers, into which branches led?

A. Yes, we would call them now the main sewers, although all the business section of the city is sewered into the sewers which were previously built.

Q. What time in 1891 were these two principal sewers
4511 constructed?

A. Oh, the construction began in May and wasn't finished until winter set in.

Q. So that those two main sewers were not used in 1891 probably at all?

A. Only a few odd houses that took advantage of them.

Q. And in 1892 some more people probably connected with them?

A. Yes, sir.

Q. Now, then, these branches were constructed as necessities of the city required, after 1892?

A. Constructed very rapidly after 1892.

Q. Do you know whether the city authorities kept a record of the sewer connections in the city of Port Huron?

A. Well, they did after I got the thing started there in 1891, but previous to that there was no record.

Q. When did you get started there as engineer?

A. I began in May, 1891.

Q. There was no record of sewer connections prior to that?

A. No, there was no record in the office.

Q. Did you make a record of the sewer connections which existed prior to that, after you established the record?

4512 A. I never made a record of all of the connections that were established after that. I made a map showing the location of all of the sewers, and I never got at a record of every house that was connected with the old sewers during my term

Q. Now, since 1891, has there been a record, say after 1892 of the sewer connections made in 1892?

A. The permits were required to be taken out as the connections were made and a record kept of them.

Q. Have you any idea of the number of yards of material that was taken out of the Black river by dredging?

A. I have not.

Q. Did you have occasion to examine the dredged material to see of what it was composed?

A. Why, only as I saw it passing through the river there and through the bridges. There were two bridges that I was frequently crossing there. I had public work going on on each side of the river and I would frequently have to wait when the bridges were swung and I could see the scows passing out.

Q. It was sand and silt from the bottom of the river?

A. And clay.

Q. And seemed to be largely earthy material?

4513 A. Yes, it was earthy material and such refuse as had accumulated in the river above it.

Q. When the Black river is in flood, does it wash itself out some?

A. Well, there is some times in the spring a good current there for a day or two and other springs it is not very perceptible.

Q. When there is a good current, does the Black river wash out?

A. Like any other river working under a good current, I suppose there is about the same scour that there would be with any stream. It would not be different from other streams under those conditions.

Q. So that the ordinary sewage deposits in Black river at times of flood would be washed out considerably?

A. Why, to some extent.

Q. The soil about or in Port Huron, you say is sand mainly?

A. Sand and clay.

Q. Is it a kind of a mixture, or is it free?

A. No, it is separate. There are sections of the city which are all sand to a depth of ten or fifteen feet, and other sections solid clay, where if you dig a sewage trench it will stand in a vertical wall like stone. 4514

Q. How much of the city is built upon this clay formation?

A. Well, there is not much of the clay formation on the north side of the river, and perhaps about one-half of the south side of the river might be—well, I guess that is a large estimate. I don't think there is half on the south side that could be called clay soil.

CROSS-EXAMINATION, by Mr. Todd.

Q. Did you ever make any soundings of the river to ascertain how much of the deposit above its natural bed was created by the sewage discharge into the Black river?

A. No, sir.

Q. Have you any idea or any opinion on the subject?

A. Not definite.

Q. Do you know whether there would be as much as a foot?

A. I wouldn't desire to put it in any given units. It is a matter I have no definite knowledge of.

Q. When did the dredging first begin?

A. Do you mean in 1891?

Q. In 1891, I mean when they first began dredging on 4515 that river, the United States Government?

A. Well, I don't know. I think there had been dredging previous to that time; that is, at former times I think, but I don't know when.

Q. Well, at this particular period?

A. Well, as I said, I think that there was some dredging done in the fall of 1891, or late in 1891; how much, I don't remember.

Q. And then the dredging ceased for a while, did it?

A. It ceased during the winter, and was resumed the following spring.

Q. Now, where was this deposit from the dredges spilled?

A. In St. Clair river.

Q. Where,—above or below the mouth of the Black river?

A. Below the mouth of the Black river.

Q. How far below, approximately?

A. I suppose a mile or a mile and a half perhaps, or a little more.

Q. Now, when it began in the spring of 1891, are you able to tell what months the dredging proceeded in 1891?

A. It began in April and continued during the season. 4516 It may have been stopped at brief intervals, but not very long. I would have no means of knowing just what days or just what weeks dredging was going on, but so far as I know, it was going on continuously, but there may have been interruptions.

Q. How long had those sewers been in operation prior to 1891?

A. Oh, the early sewers there were built in the early seventies.

Q. About how many?

A. Well, the two first ones through the business part of the town perhaps a mile of sewers there were built in the early seventies and the others followed along, all except these two main sewers which were built in 1891, were built previous to my going to Port Huron.

Q. Was all the sewage material dropped into the St. Clair river at the point about a mile below the mouth?

A. Oh, I wouldn't say that all of it was. Of course there may have been some variation in that. I saw scows dumping there, but it was none of my business and I didn't pay definite attention to it, and it was rumored that it was over the tunnel.

4517 Q. You have no definite information as to what percentage of sediment was excavated, and what percentage of clay and natural soil was taken from the bed of the river?

A. No, sir; I wouldn't attempt to put that into percentages at all.

Q. Was the water of the Black river a clear water?

A. Clear water?

Q. Yes?

A. No, it is not a clear water; it is a dark colored water.

Q. Does it differ from that in the St. Clair river?

A. Very materially.

Q. To what is the color attributed?

A. Well, the river is of a dark color as far up as I know it, and I know it nearly to its source. The source is in mucky swamps in the northern part of the Huron peninsula and above, where it is not polluted with city refuse, etc., I presume it gets its dark color from those mucky swamps. Of course through the city of Port Huron it has an added pollution.

Q. Are there any towns above on the Black river, above Port Huron?

A. There is the little town of Croswell up there, about between 25 and 30 miles, on Black river.

4518 Q. What is the population of it?

A. Oh, 1,000 or 1,200.

Q. That is the only town of any size?

A. They have no regular sewerage system.

Q. How far from the mouth of the river,—the Black river, is the last sewer or was it, in 1891?

A. You mean how far above the mouth of the last sewer emptying into the river?

Q. Yes.

A. In 1891, it was at Suffern street, a little over a mile.

Q. Which one of the sewers emptied the greatest amount of sewage into the Black river?

A. Previous to 1891?

Q. Yes, those nearest its mouth?

A. Well, those nearest its mouth, the sewers that were emptying the refuse all emptied in at the two main bridges there, —one crossed the river at Military street and the other at Seventh street. These were fairly large good sized brick sewers emptying into it previous to that time.

Q. Above Seventh street how many sewers previous to 1890, were emptying their refuse into the river?

4519 A. Previous to 1890, there were no sewers proper, except some private sewers along the banks.

Q. Well, those private sewers above Seventh street did not empty enough material so as to create a sediment in the bottom of the river above that point, did they?

A. Why, they created some sediment of course; there is no sewer but what would do its proportion probably.

Q. Well, it would be a rather small proportion,would it not?

A. Well, it would not be large that would come from a residence or business place.

Q. Was the river dredged in 1890, in the latter part, as far up as Seventh street?

A. In 1890?

Q. In the latter part of 1890?

A. I don't know that there was any dredging done in 1890.

Q. The latter part of 1891?

A. I haven't any recollection of any dredging being.done that fall above Military street. There may have been some done above that, however.

Q. Where is Military street?

4520 A. Military street on the south side, Huron avenue on the north.

Q. The amount of sediment between Military street and Seventh street, based upon the capacity of the different sewers, and their age, would be greater from the mouth to Huron street than it would be from Huron street to Seventh, would it not?

A. Well, the distance is twice as great, and of course—

Q. I mean the amount by feet above the natural bottom of the stream?

A. Would it be greater below than above?

Q. Yes?

A. Well, it is hard to tell. I don't know just how far that sewage, or how much of it would pass below the bridge that emptied in here, but considering everything, I would think the space between the two bridges would be as foul as any space of the same length of the river.

Q. I am speaking of the sediment on the bottom of the stream.

A. Well, the foulness of the stream would approximately measure the sediment.

4521 Q. They couldn't dredge the foulness, but in dredging the sediment, in your opinion would there be the same number of inches of sediment on the bottom of the stream from Huron street to the mouth as there would be between Huron street and Seventh street?

A. Why, I have no definite knowledge of that, Mr. Todd. It might vary somewhat.

Q. If in the latter part of 1891 they had dredged up to Huron street, then when the dredging was resumed in the spring, the amount of sediment from Huron street to Seventh street was dredged out first, was it not?

A. Sir?

Q. I say, then in the spring they dredged from Huron street to Seventh street?

A. I don't know. I think there was a little moving back and forwards there, and I have no data as to just how that dredging proceeded. It is all a matter of record in the Government office, and I have never attempted to get it or keep track of it.

Q. From Seventh street up to the Fiber Mills, that section of the river was never polluted by sewage discharged 4522 into the river to any great extent, was it, in 1891?

A. Not as compared with the section below.

FRANK F. ROGERS.

MR. TODD: In behalf of the Sanitary District, and I am joined by the State of Illinois, I move to exclude the evidence of Charles B. Stockwell, Hiram R. Mills, Oliver Stewart and Frank F. Rogers, for the reason that the evidence is incompetent, irrelevant and immaterial.

Adjourned until Saturday, June 27th, 1903, at Southern Hotel, 10:00 a. m.

4523 Southern Hotel, St. Louis, Missouri. 10 a. m., Saturday, June 27th, 1903. Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

E. J. HAYNES, called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Attorney-General Crow, and testified as follows:

Q. Just give the stenographer your name, address and your ocupation?

A. E. J. Haynes, Detroit, United States Engineers Office, Detroit. And my occupation I suppose would be—you may term it United States Inspector.

Q. Are you in the employ of the government?

A. Yes, sir.

Q. How long have you been?

A. About fourteen years.

Q. What line of service have you been in during those years?

A. I have been in the same line for the entire time, first as laborer and then, since 1891, as inspector.

4524 Q. Now, when you say "inspector," what do you mean by that term? Just tell us what you do?

A. Why, according to the civil service rules, an inspector is a man who takes charge of dredging.

Q. Dredging where?

A. On the rivers or lakes. It is a term given to just a branch of the employ, as near as I can say.

Q. Well, what is your duty as inspector; what do you do?

A. The inspector takes charge of any dredging that they might put him in charge of. He keeps track of the amount of material dug, the positions it is dug in, and makes a weekly or monthly report as the case may be, to the United States Engineer's office in charge of the work.

Q. Do you know whether or not there was any dredging done in the fall of 1891 and the spring of 1892 in the Black river and in front of Port Huron, Michigan?

A. Yes, sir; there was work done there in the fall of 1891 and the spring of 1892.

Q. Were you connected with that work?

A. I was.

Q. When did you begin the work in 1891?

A. That would be about November,—about the first of November.

Q. How long did you work there that fall?

4525 A. I went away on Thanksgiving Day of that year, I couldn't say whether the 25th—somewhere between the 25th and 27th of November.

Q. Now, what was the character of the work you did there in November, 1891?

A. It was deepening of the river somewhere between the mouth and Tenth street.

Q. In Port Huron?

A. In Port Huron.

Q. Well, the river was deepened by being dredged?

A. By being dredged, and the material removed taken down St. Clair river and dumped.

Q. Whereabouts in the St. Clair river was the material dumped?

A. Why, it was as near as possible over the St. Clair tunnel.

Q. What do you mean by the St. Clair tunnel?

A. The St. Clair tunnel is a tunnel running from Port Huron to Sarnia, under the St. Clair river.

Q. On the Canada side?

A. On the Canada side.

Q. Is it a railroad tunnel?

A. Yes, the Grand Trunk, I believe, built the tunnel.

Q. Was that in the channel of the St. Clair river?

A. Yes, sir. The material was principally dumped on the Canadian side of the St. Clair river, that being the deeper part.

4526 Q. The deeper part?

A. The deeper part of the river. It was done for the purpose of raising the bed of river, to protect the tunnel from leaking.

Q. Now, was there any work done in the spring of 1892, dredging at Port Huron in the Black river?

A. Yes, sir.

Q. What was it and how long did it last?

A. I couldn't say just how long it lasted. I went there about the middle of April. I was there for something like two or three months.

Q. Did you have charge of that work as inspector?

A. I did during May of 1892.

Q. Well, you were there in April, 1892?

A. Yes, sir.

Q. What was done? The Black river was dredged, was it?

A. Yes, sir; the material was dredged out of the Black river between Military and Tenth streets.

Q. In Port Huron?

A. In Port Huron.

Q. And where was that material taken?

A. To the same place in the St. Clair River.

Q. Dumped in the St. Clair river?

A. All material while I was there was dumped into the
4527 St. Clair river.

Q. Do you know how much was taken out in April, 1892?

A. About 5300 yards.

Q. The Federal Government did this dredging both times?

A. Yes, sir.

Q. You were employed, I believe you said, by the Federal Government?

A. Yes, sir.

Q. This dredging was done with the ordinary government dredging boats?

A. It was done by contract.

Q. Under the supervision of government employes?

A. Under the supervision of government employes.

Q. Well, it was done with an ordinary dredging boat?

A. Yes, sir.

CROSS-EXAMINATION, by Judge Johns.

Q. Were you an inspector in 1891?

A. Yes, sir.

Q. When did you first become an inspector?

A. I first drew my pay as inspector in the spring of 1891.

Q. Were you inspector upon the work of dredging in the harbor of Port Huron in 1891?

4528 A. Yes, sir.

Q. Were you the sole inspector?

A. No, sir.

Q. How many others were there?

A. I know of one more, and I couldn't say whether there was two or not.

Q. Who was the other?

A. H. Kallman, Jr.

Q. Where did he live?

A. At that time he was living in Port Huron.

Q. Where does he now live?

A. I couldn't say.

Q. Is he in the government employ still?

A. No, sir.

Q. When did you last hear of him?

A. That would be about two years ago. At that time he was in New York, somewhere in the city of New York; I couldn't say where.

Q. His first name, if you know?

A. Herman.

Q. Herman Kallman?

A. Herman Kallman, Jr. He has a father, now in Detroit.

Q. Is the harbor of Port Huron distinct from the Black river?

4529 A. Why, Port Huron is situated directly on the St. Clair river. There is no harbor any more than just the straight river front.

Q. That is the river front of the St. Clair river?

A. Yes, sir.

Q. There is no such thing as a harbor in the Black river?

A. The only harbor in the Black river would be for the purpose of boats running in there for the purpose of discharging cargo. It is a straight creek, and it is probably 200 to 250 feet wide.

Q. Did boats run into Black river and up as far as Tenth street to discharge cargoes in 1891?

A. Yes, sir.

Q. Where is Military street with reference to Tenth street,—up the river or down the Black river?

A. Military street is down the river from Tenth street.

Q. How far from what would be known as the mouth of Black river is Tenth street?

A. Between half and three-quarters of a mile.

Q. Do you know a place there called the fiber works?

A. Yes, sir.

Q. Where with reference to the fiber works, is Tenth street?

A. Down the river.

4530 Q. How far?

A. I should think it was about half way between the mouth of Black river—Tenth street is about half way between the mouth of Black river and the fiber works.

Q. Was there any dredging done up as far as the fiber works?

A. No, sir; not in my time.

Q. Neither in the fall of 1891, nor the spring of 1892?

A. No, sir.

Q. Was there any dredging done in the fall of 1891 above Tenth street?

A. I couldn't swear that there was or was not; I don't think there was.

Q. Was there any dredging done in the spring of 1892 above Military street?

A. Yes, sir.

Q. How far above?

A. The latter part of May, 1892, the river was dredged in front of what is called Haynes' Lumber dock, that is about—it is just about two blocks above Tenth street.

Q. This dredging was for the purpose of making a channel in the Black river, was it?

A. Yes, sir.

Q. How wide a channel?

4531 A. It would be about 100 to 150 feet.

Q. How much earth was taken out in depth?

A. The cutting in some cases would be four feet; not over that.

Q. Not over that?

A. No.

Q. And the average for the entire distance up to Tenth street—

A. About two feet.

Q. Of what did this dredged material consist?

A. The river bed proper was blue clay, and some sediment, and very little sand.

Q. What proportion of the dredged material taken out in the fall of 1891 was blue clay?

A. That would be impossible to say.

Q. What is your best judgment about it?

A. There would not be over one-third of it.

Q. How much of it would be sand?

A. The rest of the dredging would be mixed entirely with a black muck, or it is a wash from the marshes up above, and I shouldn't think—probably one-sixth of the entire remaining material would be sand.

Q. One-sixth of the remaining two-thirds?

A. Yes, sir.

4532 Q. The Black river is how long, do you know?

A. The Black river runs up the country, and it is now navigable up above the fiber works, but the river itself must be about ten or eleven miles, I should think. I don't know.

Q. It drains, and it has its origin in some marshes and swamps?

A. Yes, sir.

Q. Away from Port Huron?

A. Yes, sir.

Q. And this sediment which is in its bottom is the wash from those swamps and marshes?

A. Partly, yes, sir.

Q. From the mouth up to the fiber works is how far?

A. I should think it was something over a mile.

Q. So the Black river is navigable for about a mile?

A. About a mile and a half.

Q. How much dredged material was taken out in the fall of 1891?

A. I couldn't say that.

Q. When did the dredging commence in the fall of 1891?

A. It had been going on through the entire summer, the greater part of it. I wasn't there.

Q. Was there any dredging done except in the Black river?

4533 A. Yes, sir.

Q. Where?

A. In St. Clair river.

Q. How much of it was done in the St. Clair river?

A. Well, there was one dredge working there nearly the whole entire season as I understand it. I am not certain of it.

Q. In the fall of 1891?

A. Yes, sir; during the season of 1891.

Q. Was there any dredging in front of Port Huron and in the St. Clair river?

A. Yes, sir. There was one contract covered the deepening of what they called the Middle Grounds, gravel washed from the rapids of the St. Clair river, and the other contract we were just speaking of was a contract in the Black river for deepening of the river.

Q. Where was the material dumped from the Middle Grounds, or from the St. Clair river?

A. Over the St. Clair tunnel.

Q. In the same place as the—

A. As near as possible; yes, sir.

Q. —dumping from the Black river?

A. Yes, sir.

Q. Which was the larger contract?

4534 A. I couldn't say for certain. I think both contracts were the same price, $10,000.00.

Q. Was there a specified amount of work for the St. Clair river in what you call the Middle Grounds?

A. There was $10,000 appropriated—I say $10,000, I am not sure of the amount, and the contractor agreed to remove the material for a certain amount per yard, and he removed material enough to use the entire amount of money.

Q. Until the appropriation was exhausted?

A. Yes, sir; until the appropriation was exhausted.

Q. Where is this Middle Grounds with reference to the mouth of the Black river?

A. Directly below it; on the American side.

Q. On the American side below the mouth of the Black river?

A. Yes, sir.

Q. In the St. Clair river?

A. Yes, sir.

Q. Now, do you know how much dredged material was taken out of the Middle Grounds in the fall of 1891?

A. No, sir.

Q. Do you know how much was taken out in the spring of 1892 from the Middle Grounds?

A. No, sir.

4535 Q. Do you know how much was taken out of the St. Clair river in the fall of 1891?

A. No, sir.

Q. You think there was 5300 yards taken out of the Black river in the spring of 1892?

A. 5300.

Q. I mean 5300 yards?

A. Black river—yes, sir; that was in April, 1892.

Q. At what time did you say 5300 yards were taken out?

A. That was taken out in April, 1892.

Q. Where did you obtain these figures of 5300 yards?

A. United States Engineer Office, Detroit, Old Post Office Building.

Q. When?

A. Last Tuesday.

Q. Why, did you not obtain the figures for the dredging in the Black river in the fall of 1891?

A. I wasn't led to believe that they were wanted.

Q. At whose request did you obtain these figures?

A. Gardner S. Williams.

Q. Where did you meet him?

A. I never met him. I have heard from him at different times.

Q. Do you know whether he is the Gardner S. Williams 4536 who testified in this case as an expert?

A. I should think he was; yes, sir.

Q. When did you hear from him with reference to it?

A. About the 16th of June.

Q. Of this present year?

A. Yes, sir.

Q. From what place did he communicate with you?

A. Ithica, New York.

Q. You investigated this record at the request of Mr. Williams?

A. Yes, sir.

Q. How wide is the St. Clair river at Port Huron?

A. In the navigable bed?

Q. No, the entire width from shore to shore?

A. About 250 feet, perhaps 300.

Q. The entire width of the river?

A. Yes, sir.

Q. 250 feet?

A. Or 300.

GENERAL CROW: Black river you are talking about?

JUDGE JOHNS: No, the St. Clair river.

A. Oh, the St. Clair river, about three-quarters of a mile.

Q. Is it quite swift at that point?

4537 A. It is towards the Canadian shore; towards the American shore there is an eddy that causes gravel to settle upon the American side.

Q. The current is more swift on the Canadian side?

A. Yes, sir.

Q. And it was on the Canadian side that this dredged material was dumped?

A. Yes, sir; on the Canadian side.

Q. This dumping, I presume, was from scows?

A. Yes, sir.

Q. And was carried on during the fall of 1891, as the scows were loaded?

A. Yes, sir.

Q. It was not dumped in one body, but only by the scow loads?

A. Scow loads, about 150 yards or something like that in a scow.

Q. About how much?

A. 100 to probably 150 yards; I don't know just how much it was.

Q. And in the spring of 1892, was the dumping conducted in the same way?

A. Yes, sir.

Q. Now, the St. Clair river runs into Lake St. Clair?

A. Yes, sir.

Q. And opposite Port Huron the deepest part of the St.
4538 Clair river is on the Canadian side?

A. Yes, sir.

Q. This dumping was not to protect the tunnel from being struck by passing boats, but to prevent its leaking?

A. Yes, to prevent its surface wearing down; it was rather thin over the Canadian side I understood.

Q. From what part of the Black river was this 5300 yards obtained, in the spring of 1892 between Tenth and Military streets?

A. Between Seventh and Military streets.

Q. Between Seventh and Military streets?

A. Yes, sir. Well, no, it would be below Tenth street. It would be between Tenth and Military streets.

Q. Between Tenth and Military streets?

A. Yes, sir.

Q. How far from the mouth of Black river is Tenth street?

A. Well, it would be something over half a mile. I don't know exactly, what it was. There are ten streets .

Q. Is First street on the river front, and then do they run back up the Black river by number?

A. The first street I remember is Sixth street, so there would be six blocks back—six ordinary street blocks.

Q. Is Black river lined with docks on each side from its
4539 mouth to Tenth street?

A. On the north side it is. On the south side it is nearly all the way.

Q. What is the character of these docks, piling and platforms?

A. Piling and platforms always.

Q. And water running under the piling?

A. Yes.

Q. Or through the piling between the piles. There are no walled docks there?

A. No, sir.

Q. Nor are the piles planked to the bottom of the river?

A. There may be some dikes built that way. I don't remember of any.

Q. Well, is it one continuous dock on the north side or is it separate docks with slips?

A. They would be continuous docks. There are no slips as I remember it.

Q. A continuous line of piling with planks on top, constituting a dock for half a mile there?

A. Yes, sir.

Q. And on the south side of the river an occasional dock?

A. On the south side there are docks all the way from the 4540 mouth of the river to Seventh street.

Q. Was there in 1892?

A. Yes, sir. That is when I was giving it.

Q. You are talking of 1892?

A. Yes, sir.

Q. How far from the mouth of Black river across St. Clair river was it to the place where this dredged material was dumped?

A. From Black river to where the material was dumped?

Q. From the mouth of the St. Clair river; from the river front of St. Clair river?

A. It was not over a mile and a half I don't think.

Q. Now, was this dredged material all dumped in one place or was it dumped along the line of the top of this tunnel?

A. Dumped along the line of the top of the tunnel.

Q. For what distance from the Canadian shore?

A. Well, the object was to dump it in the deep water over the tunnel.

Q. Would it extend along the tunnel as far as a quarter of a mile?

A. It would.

Q. So that the dredged material was deposited along the line of this tunnel for a distance of about a quarter of a mile, you would say?

A. Yes, sir.

4541 CROSS-EXAMINATION, by Mr. Todd.

Q. In 1891, what months was dredging done in?

A. Oh, I wouldn't say for certain what months the work was done in, but I know there was some done in November. I went from the Clinton river up there.

Q. Was there any done in December?

A. I came home sick Thanksgiving Day of November. I could not say.

Q. Do you know whether there was any done in December?

A. No, I don't know.

Q. Any in January, 1892?

A. No, sir.

Q. There was none done in January?

A. No, sir; the season was closed. I am not certain, but I believe the season was closed in November, 1891.

Q. So, then, if that statement is correct, there was no dredging done in December of 1891, and January, February and March and up to the middle of April, 1892?

A. No, sir.

Q. How was this dredging measured, by scow measurement or place measurement?

A. Scow measurement.

Q. Did you have anything to do with any soundings upon the river?

4542 A. Upon the Black river?

Q. Yes.

A. No, sir.

Q. What other characteristics did you find in the soil excavated from the bottom of Black river, except the sediments which came from the woods and swamps, the clay and the sand, if any?

A. Why, the material gave off rather an offensive odor at all times. There was a sediment from all the causes I suppose that ordinarily occur in such a creek, where the sewage and such things were dumped into the river.

Q. What was the current of the river—the Black river?

A. During the summer months there was no current. In the spring there was a freshet which took the ice and everything out of it.

Q. Was the same character of soil excavated between Sixth street and the river found above Sixth street and the point where the dredging ceased, above Sixth street?

A. As I remember it; yes, sir.

Q. Did you observe any difference in the character of the dredging?

A. No, sir.

Q. The same characteristics prevailed from the mouth of the river up to the point where you ceased to dredge?

4543 A. There was very little change, if any. I couldn't recall any just now.

RE-DIRECT EXAMINATION, by General Crow.

Q. This dredging was done immediately in front of the city of Port Huron?

A. Yes, sir.

GENERAL CROW: That's all.

E. J. HAYNES.

4544 Southern Hotel, St. Louis, Missouri. 1:15 p. m., Saturday, June 27th, 1903. Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

WILLIAM C. TEICHMANN, recalled for further direct examination by Attorney-General Crow, testified as follows:

Q. Now, Doctor Teichmann, what are these charts here that you have?

A. These are nineteen charts which were prepared under my direction and supervision by Mr. Alexander Miller and William H. Getz.

Q. These charts are the same ones you used in your testimony and referred to in your testimony?

A. Yes, sir.

Q. Your testimony in chief?

A. Yes, sir. They are the ones referred to in my testimony as charts numbered 1, 2, 3, and so on to chart No. 19.

4545 Q. They are made from the analyses made under your direction in this case?

A. Yes, sir.

Q. That you have heretofore testified about?

A. They were made entirely from the analytical data which I collected from the analyses of samples of water made in the city chemist's office during the years 1900 and 1901.

GENERAL CROW: We will just offer these charts in evidence, Mr. Commissioner.

Said charts received in evidence and marked by the Commissioner "Complainant's Exhibits 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69 and 70. Frank S. Bright, Commissioner."

WILLIAM C. TEICHMANN.

No cross-examination.

All these exhibits will be found bound in volume of Complainant's Exhibits.

4546 WILLIAM T. SEDGWICK recalled in behalf of the complainant, was examined in chief by Attorney-General Crow, and testified as follows:

Q. Mr. Sedgwick, when you were on the stand before, you testified as to the pollution of certain streams which you then named which had come under your personal observation, which pollution was caused by sewage being discharged thereinto. Now, I will ask you if you know of any other streams besides those that you testified to that you have investigated, whose waters have been polluted with the sewage of towns and cities and thereby rendered unhealthful?

A. Yes, sir.

Q. What other stream is it that you have investigated and found the waters polluted?

A. At that time I recalled indistinctly and not with sufficient knowledge to enable me to testify in regard to it, the facts relating to the pollution of the Potomac river and the effect of this pollution upon the typhoid fever conditions in the city of Washington, D. C. Since that time I have visited Washington and made a careful examination of the typhoid fever statistics on file in the office of the Department of Health, and in particular, have inquired into a very serious and extensive infection of the river which took place at Cumberland,
4547 Maryland, in 1890. I have also visited Cumberland and have made inquiries from some of the physicians and I have secured by correspondence from one of the physicians who at the time of the epidemic wrote about it, and has been much

quoted in regard to it, and I find that in December, 1889, and more particularly in January, February, March and April, 1890, there was in the town, or city I suppose it is—in the city ot Cumberland, a very extensive epidemic of typhoid fever, the effect of which was at the time, by a competent investigator, asserted to be plainly discoverable in an increase of the typhoid fever cases in Washington. I have recently reviewed the records in Washington and obtained from physicians on the spot at the time, in Cumberland, the facts so far as they could give them to me in that city; and I believe that this epidemic and its consequences constitute one of the most important examples on record of the transmission of typhoid fever germs over long distances.

JUDGE JOHNS: I object on the part of the State of Illinois to any recitation of the facts learned by the witness from other sources than his own personal observation, and from records, because the facts, if they exist, are capable of better proof than a recitation by the witness of things he has learned from other people, and the records are the best evidence of the facts which he purports to state, as existing or as shown
4548 by such records, and I move to strike out all of the foregoing answer which pertains to the supposed epidemic of typhoid fever in the city of Cumberland, Maryland, and the supposed consequent epidemic in Washington.

MR.TODD: The Sanitary District Joins in the same objection and motion.

Q. ATTORNEY-GENERAL CROW: Professor, did you ascertain that there was an epidemic of typhoid in 1889 and 1890 in the city of Cumberland, Maryland?

A. I did.

Q. Do you know about how many cases there were?

A. There appear to have been in January, 1890, eighteen deaths; in February, 27; in March 39; in April 8; and in May 5; and there was also one death in December, but this was that of an imported case.

Q. In 1889 or 1890?

A. In December, 1889.

Q. And the other months, were they in 1889 or 1890?

A. In 1890; those that I gave you. That is to say by some the epidemic was thought to have begun in December, 1889, but

the deaths began, properly speaking, in January, 1890. There were therefore, all told, in the epidemic in Cumberland, 98 deaths from typhoid fever, and although it has been re-
4549 peatedly stated in sanitary discussions and pamphlets
relating to the water supply of Washington, that there were 485 reported cases of typhoid fever in Cumberland—

Q. In Cumberland or in Washington?

A. In Cumberland at this time, and in this epidemic—the number of deaths indicates that there must have been actually nearly double that amount. An effect of this epidemic appears to have become marked in Washington in March, 1890, when the total number of deaths from typhoid fever was 19, and to have extended through August, the number of deaths per month having been:

March,	19
April,	11
May,	13
June,	33
July,	36
August,	28

and after August no effect of the epidemic can be traced in the deaths from typhoid fever in Washington.

This case is a particularly interesting one and has been repeatedly referred to in public meetings and conferences and hearings before Congressional and other committees and the like, in Washington, but has not hitherto found its way to any considerable extent into the books upon the subject. I re-
4550 gard it, however, as perhaps on the whole, as I have already intimated, a most instructive example of the transmission of typhoid germs in a polluted stream over a long distance, because Cumberland is about 175 miles from Washington by the river, and because the river is of such a character as to offer a good example of a stream neither very swift nor very slow, but having occasional areas of what might be called slack water; these succeeded by steeper portions, and therefore affording good opportunities for a certain amount of so-called self-purification en route.

The epidemic moreover in Cumberland, having been a very extensive one, must have afforded a heavy infection of the stream, although it is a fact that at that time the city of Cumberland was not at all thoroughly sewered. It is however peculiarly arranged with respect to the water courses flowing past or through it. It is at the junction of that portion of the river which comes down from the Allegheny mountains, and another portion which comes from the West Virginia hills, and in 1890 there was (and there still is) a large number of privies overhanging the streams, which consist of the Potomac on the south and two small runs emptying into the Potomac near the intake of the waterworks, and a creek known as Wills Creek. The two runs and the creek receive directly a large amount of fecal matter from the privies referred to and so striking was this arrangement, that Doctor Kober who made 4551 the first investigation of the epidemic, published a plate showing these unsanitary conditions and this plate has been repeatedly copied. I should like to introduce that if it is competent evidence.

GENERAL CROW: You may offer it.

THE WITNESS: And I will offer a copy of it which appears in the report of the Commissioners of the District of Columbia for 1895, opposite page 1337.

One other fact of great importance I think should be mentioned. Between October 4th, 1889 and March 18th, 1890, the sedimentation basin in Washington and the distributing reservoir also appear to have been out of service so that during this period the water of the Potomac was delivered to the citizens of Washington without purification of any kind, a fact which no doubt added to the severity of the outbreak in Washington.

MR. TODD: I move to strike out the answer for the same reasons that are stated in the last objection made to the last preceding question, and the motion.

JUDGE JOHNS: And the State of Illinois joins in the motion.

Q. GENERAL CROW: When did the typhoid break out in Washington, what month,—do you know?

4552 A. The typhoid deaths—the excess of typhoid deaths—Washington has long had an excessive death rate from typhoid fever. This has been repeatedly attributed in part by competent experts to the use in that City of the Potomac River water for drinking purposes; but, during and from March, 1890, through August of the same year, this excess reached extraordinary proportions; so much so that if the typhoid deaths in these months are compared with the average monthly typhoid mortality for the five years previous to 1890, and for the five years after 1890, it appears that this excess amounted to about one hundred per cent. That is to say, in addition to the ordinarily excessive typhoid of Washington, there was apparently, owing to this epidemic in Cumberland, Md., a further excess of about one hundred per cent. So clear was this connection regarded or held to be by local authorities, that when a case of Asiatic cholera was reported to have appeared in Cumberland, Md., in 1894, grave anxiety was felt by these experts in Washington. Fortunately, however, the case proved to be something else than Asiatic cholera.

The question will naturally be asked, How long does it take for water to flow from Cumberland to Washington, and this time has been variously estimated; but is given by Capt. Gaillard, of the U. S. Engineers, in Senate Document No. 94, 55th Congress, second session, as from four to seven days from
Cumberland to the intake, and by one of the officials of the
4553 U. S. Geological Survey, as from two to four days.

It is interesting to note in connection with the epidemic in Washington in 1890, which followed that in Cumberland, Md. in the same year, that the excess of deaths of typhoid fever in Washington is not clearly marked until about two months after the outbreak in Cumberland. That is to say, while there were eighteen deaths in Cumberland in January, 1890, no marked excess appears in Washington until March. Furthermore, while the epidemic in Cumberland ended in May, that in Washington was continued vigorously during July, and even to some extent during August. Whether this delay in the instance of deaths in Washington is or is not due to the temporary deposit of the germs in the bed of the stream from which they were afterwards returned from the flowing water and delivered in Washington it is impossible to say positively, but it is difficult to resist the feeling that this may have been the case. It is certainly a remarkable and interesting fact. We know, to

be sure, that persons who have had typhoid fever continue, even after recovering, often for considerable periods, to discharge germs from the body, and it may have been that a part at least of the tardier appearance of the disease in Washington and its continuance after the epidemic in Cumberland had ceased, was due to this cause; but it may also have been due to the thorough infection of the river—of the bed of the stream, which was not entirely washed out for sometime after the epidemic
was over, in part also, the later appearance is also un-
4554 doubtedly due to the passage of the water through the
settling basin and distributing reservoir, which were in operation after March 18th.

MR. TODD: I move to strike out the answer and all the recitations and conclusions cited by the witness in regard to other experts, as being incompetent and not proper evidence.

JUDGE JOHNS: State of Illinois joins in that objection and motion.

Q. GENERAL CROW: How large a town is Cumberland, Md.?

A. Its population at that time is said to have been twelve thousand.

Q. What is its size now?

A. I think it is nearer twenty thousand today.

Q. Did they have at that time, 1890, a system of water works in Cumberland?

A. Yes sir. And the epidemic in Cumberland is supposed to have been caused, and in my judgment was caused by an infection of their own water supply by a case of typhoid fever happening just above the intake of their water works, which was placed in a very objectionable position in the Potomac river.

Q. The source of their water supply is the same stream as that of the City of Washington, the Potomac River.

A. The Potomac river. It is the South branch of the Potomac River.

Q. The number of cases in Washington was how many, did you say in 1890?

4555 A. I gave only deaths, not cases.

Q. Well, deaths?

A. The number of deaths during this epidemic was 140, if I remember right.

Q. During the period of a few months?

A. Yes, 140 deaths during the period of six months.

Q. How many cases would that indicate in the City of Washington?

A. About 1400.

Q. Do you know the population of Washington City at that time?

A. (Referring to memorandum) 250,000.

Q. Do you know anything about the present supply, and the supply for the last few years, of water for the City of Washington, as to whether or not it has been considered suitable and safe for drinking purposes?

JUDGE JOHNS: Objected to as irrelevant and incompetent.

A. Yes, the problem of the water supply of the City of Washington has been a matter of very grave concern to the citizens of that city, and ought to be to the citizens of the whole country, as it is a very much visited city, and as I have already said, it has long been high in typhoid fever. It has been attributed, in my judgment and with reason, in large part 4556 to the use of the polluted water of the Potomac River. So much so has that been the case that numerous reports and meetings and conferences have been held on the subject, and there is probably no water supply in the country that has been more thoroughly discussed in which public opinion has crystallized more fully than in the case of the water supply of the City of Washington. It was recognized that the Potomac is a polluted stream, although there are very few sewered towns upon it, but there are these overhanging privies and the like and it is anything but a good supply. Steps, however, are being taken at the present time to adequately purify it.

Q. In what manner?

A. By an extension of the system of sedimentation and filtration.

Q. What kind of filtration?

A. They are going to use partly the slow sand filters, and when the water is very turbid and clayey, the rapid mechanical filters.

Q. Is that the Alton filter, the rapid mechanical filter?

A. That is the Alton method.

Q. So that they will have a combination of the two methods of filtration there in Washington City?

A. They will have. The contracts have just been let.

4557 Q. Do you know how the distance from Cumberland to Washington by river compares with the length of the River Thames in the United Kingdom?

A. The Thames is 209 miles long, and is, I believe, the longest river in the United Kingdom, and this epidemic seems to confirm in a very remarkable way that statement of the Rivers Pollution Commission of Great Britain, to which I have referred in my previous testimony, where they said that there was no river in the world that was long enough to purify itself of any sewage introduced into it even at its source.

Q. This record you have here, is that an official report of the Commissioners?

A. This is the official annual report of the Commissioners of the District of Columbia so far as the Department of Health is concerned.

Q. For what year?

A. 1895.

Q. 1895?

A. Yes sir. In 1895 there was another serious epidemic in Washington, which was carefully investigated, but it was not directly connected, so far as I am aware, with the event of typhoid fever in Cumberland.

Q. Now, you have visited the City of Cumberland, have you?

A. I have.

4558 Q. And visited Washington City?

A. I have.

Q. And observed the Potomac River?

A. Yes sir.

Q. And you are familiar with the conditions there?

A. I have been familiar with the conditions in Washington in a general way for a good while, but I have never visited Cumberland till recently. Nor was I familiar, except in a general way, with the Potomac River.

Q. Now, from your knowledge of the situation, and of the conditions that prevailed in 1889 and 1890 in the City of Cumberland, Md., and the City of Washington, the conditions of the Potomac River, and the water supply of the two towns, of the sewage and human deffication of the stream of the Potomac River, I will get you to state whether or not, in your judgment, the epidemic of typhoid fever in 1889 and 1890 in the City of Washington was caused by the placing of sewage infected with typhoid bacilli in the waters of the Potomac River at the City of Cumberland, Md.?

A. I should hardly call the excess of typhoid fever in Washington in 1890 an epidemic, although that term might perhaps very well be applied to it. It was rather an extraordinary and unusual excess of typhoid fever, and, in my judgment, this excess was and is directly traceable to the great epi- 4559 demic of typhoid fever occurring shortly before, and during a portion of the same period in the City of Cumberland, Md.,—germs from that epidemic having apparently passed down the river into the water supply of the City of Washington alive and virulent. Of course there must have been a considerable removal of germs en route, else the outbreak in Washington would have been far more severe.

Q. What was the percentage increase in the death rate in 1890 in the City of Washington as compared with previous periods of similar extent?

A. I have already stated that, for this period, the increase of typhoid fever mortality over and above the average mortality for the same period during the five years preceding and during the five years afterwards was about 100 per cent. I don't know what the effect was upon the general death rate, and owing to the fact that the Washington Board of Health keeps its records by calendar years, their records are somewhat obscure, by the fact that a portion of this epidemic on their records appears in 1889 and a portion in 1890, but the consequence of that is that although these two years in their records appear to be the same, this is for the reasons indicated, that they are reckoned by the calendar year, not by the fiscal year. If the figures are examined in the way in which I have stated, and studied as I have studied them, the results are those that

I have already given. It remains, however, a fact that
4560 even upon their own showing, the two years, 1889 and
1890, were exceedingly high in typhoid fever mortality.

CROSS EXAMINATION.

By Judge Johns.

Q. When did you make the examination of the excess of typhoid fever in Washington?

A. It was immediately after I left St. Louis on my last visit, and about the first of June.

Q. Of the present year?

A. Of the present year, yes sir.

Q. And after you had finished your testimony given here in May?

A. Yes sir.

Q. Were you then in the employ of the State of Missouri as an expert?

A. Yes, sir, I was.

Q. Were you instructed by the State of Missouri through its Attorney General to make this investigation in Washington?

A. I suggested to the Attorney General that it would be wise for me to go and make this investigation and he then instructed me to do so.

Q. Are you still in the employ of the State of Missouri as an expert in this case?

A. Yes, sir.

4561 Q. And expect to be in such employ until the close of the testimony in this case?

A. Until further notice, at any rate, yes sir.

Q. You are now acting for and in behalf of the State of Missouri in an advisory capacity in this lawsuit as an expert?

A. I understand that I am, yes sir.

Q. From what point in the Potomac River does Washington receive its water supply?

A. At a point called Great Falls.

Q. How far from the Capitol building is that?

A. I don't think that I could answer that question, but it is about four and one-half miles from Washington.

Q. Up the river?

A. (Referring to memorandum) 14 miles above Washington.

Q. That information you derive from some report from which you are now refreshing your memory?

A. Yes sir.

Q. Outside of that report, do you know as to the fact?

A. Yes sir.

Q. From what report are you refreshing your memory?

A. This is a report of an investigation of the feasibility and propriety of filtering the water supply of Washington, D. C, with detailed estimates of the cost of the work required, by Col. A. M. Miller, of the U. S. Engineers, who has recently had charge of the water supply of Washington. 4562

Q. Do the tides run up the Potomac River past Washington?

A. I understand the tide is felt above Washington, or at and near Washington, but that salt water does not run up above Washington; but I have no especial knowledge on that point.

Q. Do you know whether the tides are felt at the intake of the Washington water works?

A. I understand that they are not. This is above?

Q. Above the influence of the tides?

A. Yes, sir, so I understand.

Q. Do you know what the tidal rise is at Washington?

A. I do not.

Q. What kind of water supply, or water system, had the City of Washington in 1890 and 1891?

A. What kind of supply?

Q. Yes, was it taken from the river and passed through sedimentation tanks?

A. In general it was taken from the river and carried through a sedimentation basin where it was allowed to sediment to a certain extent; then it was lifted to a distributing reservoir, and from there sent direct to the citizens; but at times the sedimentation basin was not employed and at those times the water was sent directly to the distributing reservoir. On this one occasion to which I refer, as I understand it, both sedimentation basin and distributing reservoir were out of service. 4563

Q. And the water pumped virtually from the Potomac River into the mains in the City of Washington?

A. I suppose it was, yes sir.

Q. From whom did you obtain that information?

A. That is stated in a letter of Capt. D. D. Gaillard, U. S. Engineers—in a letter dated February 24th, 1898, and addressed to Dr. Geo. M. Kober, the well known sanitary expert who first studied the Cumberland epidemic and who first pointed out its probable connection with Washington.

Q. What other experts have studied the epidemic about Cumberland and the consequent increase of typhoid at Washington in 1890 and 1891?

A. So far as I know, no one has studied it thoroughly excepting Dr. Kober, and, if I may be permitted to say so, myself.

Q. What other experts had grave apprehensions as to Asiatic cholera when it was discovered that there was a case of Asiatic cholera in Cumberland?

A. My authority for the statement which I have made in that connection is Dr. J. J. Kinyoun, an eminent bacteriologist connected until recently with the U. S. Marine Hospital Service, and is found in a discussion by Dr. Kinyoun of the question of water supply for the District of Columbia published in Document 183, Fifty-fifth Congress, Second Session, page 25.

4564 Q. House or Senate document?

A. Senate document.

Q. Well, now, in addition to this gentleman, what other experts had grave anxiety about it?

A. Excuse me, may I just—

Q. I am only asking you for names.

A. I should like, however, to give this one instance here.

Q. Well, I object to it. I am asking you now only for names.

A. Dr. Kinyoun said—

Q. I object to the reading of anything that Dr. Kinyoun said from the book in possession of the witness, and to the witness reading here anything which is not responsive to the question, the question being only as to the name of the experts.

A. I don't care to insist at all.

Q. What other experts now had grave anxiety about Asiatic cholera than the one you have named?

A. He is the only one that I know of who had such anxiety, but as I know that he was associated with other sanitarians of note, I have no doubt that the matter was talked over by them at the time.

Q. Did you talk with Dr. Kinyoun yourself in this visit to Washington?

A. No, sir, I did not.

Q. Your information as to his grave anxiety arises from reading something that he got in print?

A. It does.

4565 Q. Then because he did that you infer that other sanitarians had like grave anxiety with reference to it?

A. I do.

Q. Now, before what committee of Congress was this epidemic in Cumberland discussed?

A. It was not discussed so far as I know before any committee.

Q. By what committee was it investigated?

A. Nor was it investigated. It has been referred to in numerous discussions and conferences, as for example—

Q. I am asking you now only for committees of Congress.

A. Exactly, that is what I am after.

Q. And I object to any statement as to any other thing under the present question than committees appointed.

A. Senate Document 183, already referred to, and which shows that the Senate committee on the District of Columbia—possibly the whole committee on the District of Columbia, in a letter from its clerk dated February 21st, 1898, accepted an invitation from the Medical Society of the District of Columbia to attend a meeting of that society on the following Wednesday; and further on in this document it appears that the Cumberland epidemic and its possible effects on the City of Washington were at that time discussed by Dr. Kober. Of course I cannot say that the committee was present, but I infer that it was. 4566

Q. Was this a somewhat protracted meeting of the

Health or Medical Socity of Washington as appears from that document?

A. The document simply recites a report of the committee of the Medical Society on the water supply and sewage disposal of the District of Columbia and the discussion thereon, and does not bear evidence as to how protracted the discussion may or may not have been.

Q. Nor any evidence as to whether the Senate committee for the District of Columbia was present?

A. No, sir.

Q. How many cases—

A. Excuse me one moment. This is one example, and I think that there has been others of the same sort, but I don't happen to have them with me.

Q. That is examples of times when committees of Congress took some interest in this matter.

A. Yes, I think so.

Q. Now, whether any committee of Congress actually investigated the typhoid epidemic in Cumberland you are not prepared to state?

A. I am not prepared to state.

Q. Now, how many cases do you say were reported of typhoid fever in Washington in December of 1889 and the first seven months of 1890?

567 A. In Washington?

Q. Yes, sir.

A. I don't think I said how many were reported in December of 1889, but I can give them however. But I suppose ou meant deaths and not cases.

Q. No, I mean cases.

A. I don't know, no.

Q. How many cases were reported in the first seven onths of 1890?

A. I have not paid any attention to the number of reported cases in Washington, but only to the deaths.

Q. Have you stated in your examination in chief that there ere reported, or assumed to be, about 458 cases?

A. No, sir, that was in Cumberland, 485.

Q. 485 cases?

A. Yes, sir.

Q. Now, from what source did you obtain that information of 485 cases in Cumberland?

A. That rests, both in Dr. Kober's reports and in my own case, upon the authority of Dr. W. W. Wiley, of Cumberland. The health records of Cumberland are exceedingly defective. I have endeavored to obtain officially the necessary data, but was unable to do so, and both for the cases and for the deaths in Cumberland I am dependent, as Dr. Kober was, upon Dr. Wiley, the local physician.

4568 Q. Was this Dr. Wiley a resident of Cumberland during this epidemic of 1890?

A. Yes, sir, he was.

Q. He reported there were 485 cases, did he?

A. He has written to me that there were 485 reported cases.

Q. Reported cases?

A. Reported cases.

Q. You prefer not to believe that?

A. Yes, I believe that there were 485 reported cases.

Q. But you also believe that there were a great many other cases, namely: about 1000?

A. I also believe that there must have been upwards of about 1000 cases in Cumberland, judging by the deaths.

Q. And that is upon the theory that there are about ten cases of typhoid fever to one death?

A. It is upon the experience of mankind that there are at least ten cases to one death.

Q. If it should be authoritatively reported that there were 500 cases of typhoid fever only in a given locality and that there were 125 deaths, would you believe it?

A. Not without making a further examination of the facts, or by personal inquiry into them, because this would be so remarkable a fatality as to excite the gravest suspicion.

Q. If a report does not conform to what you call the ex-
4569 perience of mankind in reference to the ratio of deaths
to cases in typhoid fever, you don't believe the report?

A. I don't believe the report as a rule, because we have so many instances in which physicians fail to report their cases and because, furthermore, there are many cases which never come to the knowledge of physicians, walking cases and the like.

Q. Suppose it was reported by what you would deem competent authority that there actually was not another case than 500, the excess in cases of the exact number of five hundred in any given locality, and that there were actually only 125 deaths from typhoid fever, you would not believe the report?

A. Not without looking into it somewhat to see. It is possible of course that in a very severe epidemic the fatality should be unusually high, but such a statement as that would call for some explanation.

Q. As it would not conform to your belief in reference to the ratio of deaths to the cases of typhoid fever, you would want further evidence than the report?

A. I should. It would be on the face of it entirely out of harmony with the sum of human experience and medical knowledge in these matters, and I should therefore expect that whoever made such a report should give some reason for the extraordinary fatality.

4570 Q. How many miles long is the Potomac River?

A. I don't think I can answer that question.

Q. How many branches has it which are designated by the name of Potomac?

A. As I understand it, it is generally called the Potomac above Cumberland, on the south side, but that a better description of the river would be to say that it was formed at Cumberland by two principle sets of tributaries, one from the south and one from the north.

Q. Is either one of those tributaries designated upon the maps as the Potomac?

A. I rather think that the southerly one is, but I am not sure about that.

Q. What is the other one named upon the maps?

A. The other one, the principal one, is Will's Creek.

Q. In its entire extent, what is the area of the valley of the Potomac?

A. I have no personal knowledge of this, but referring to Col. Miller, of the U. S. Engineers, the drainage area above the intake figures 11043 square miles.

Q. What is the population of that drainage area?

A. Col. Miller gives it at 44 1-2 sq. miles.

Q. 44 1-2 of population to the square mile?

A. Yes, estimated for 1900.

Q. That is quite a thickly populated country then?

4571 A. Yes sir.

Q. Are there towns and cities upon the Potomac above Washington and below Cumberland?

A. There are a number.

Q. How many?

A. Well, I don't know how many, but in 1890 none of these, as I understand it, were sewered. The principal ones were Harper's Ferry, Hagerstown, Frederick, Winchester and a number of others that I don't remember.

Q. I didn't ask you about the sewerage, I was asking you about the number of towns.

A. I don't know what the number of towns is. It is considerable.

Q. Are there towns upon either of the branches of the Potomac River above Cumberland.

A. There are.

Q. How many upon the South Branch?

A. I don't know, but there are two which are commonly referred to as Piedmont and Keyser.

Q. What upon the north branch?

A. I think there are a few upon the north branch. The north branch is comparatively small.

Q. The valley of the Potomac is a very rich, agricultural country is it not?

A. It is.

4572 Q. And is for an agricultural country thickly populated?

A. I should say so, yes.

Q. And has upon it a large amount of domestic animals?

A. Yes sir.

Q. And is much in its agricultural characteristics a gardening country, is it not?

A. I should hardly say that it is an agricultural country certainly.

Q. Well, isn't the principal industry raising vegetables for the market?

A. I am unable to say.

Q. Now, in 1889, was typhoid fever in any one of these towns, save Cumberland?

A. *Not so far as I have been able to learn.*

Q. You haven't heard of any?

A. I have inquired and have not learned of any.

Q. What kind of inquiries did you make about it?

A. In Washington, talking with the health officials, who are fairly familiar with the condition of the water sheds, and in Cumberland with physicians.

Q. With what health official in Washington have you talked while engaged in this investigation?

A. Dr. Woodward, Chairman of the Board of Health.

Q. Was he in Washington during this period of 1889 and 1890?

A. I think he was, although I am not sure.

4573 Q. With what other person have you talked upon the subject?

A. No one else in Washington, except some of the people in the office, whom I didn't know, but in Cumberland with the doctors that I referred to.

Q. With what doctors in Cumberland?

A. I talked with Dr. Johnston, Dr. Speer and I corresponded with Dr. Wiley.

Q. When were you in Cumberland? ?

A. As I have said, about June 1st. I have not the means here of saying the exact date.

Q. How long were you there?

A. Half a day.

Q. You arrived there on some morning train and left on some noon train?

A. The other way around. I arrived at noon and left at night.

Q. With what other person than Dr. Wiley did you talk in Cumberland?

A. Dr. Johnston and Dr. Speers.

Q. Did you examine during that half day the records of—

A. I tried to, but there were not any except since 1900.

Q. There were no health records in Cumberland prior to 1900?

A. I could find none in the health office. I was very much dissappointed.

4574 Q. Do you know whether there was typhoid fever in any of the towns on any of the tributaries above Cumberland on the Potomac River?

A. At that time?

Q. Yes?

A. Not so far as I could learn.

Q. You haven't heard of any?

A. I haven't heard of any.

Q. What are the tributaries of the Potomac River below Cumberland, Md. and to Washington?

A. I think the principal tributaries are the Shenandoah and the Monocacy, although there are others, such as the Antietam creek and very likely some smaller ones that I do not know about.

Q. Does the Shenandoah river drain the Shenandoah valley?

A. Yes, sir.

Q. That is a very thickly populated agricultural region?

A. It is a rich, fine agricultural country. I shouldn't say very thickly populated. I have driven up through there. I should say that it was not very thickly populated.

Q. Not very thickly populated as an agricultural region?

A. That depends upon one's standard of course. As compared with New England in many places I should say not.

Q. There is no agricultural country in New England to speak of. I am speaking now of agricultural country.

4575 A. Speaking of it from the standpoint of southern Illinois and Indiana I would say that it was rather thickly populated.

Q. And the Shenandoah valley has its drainage, its surface drainage into the Shenandoah river?

A. Yes, sir.

Q. Thence into the Potomac?

A. Thence into the Potomac.

Q. Do you know the drainage area of the Shenandoah valley or of the Shenandoah river?

A. No, sir; I do not.

Q. Do you know the drainage area of the Monocacy?

A. No, sir.

Q. Is the valley of the Monocacy an agricultural region?

A. I am not familiar with that. I don't know.

Q. Was there any typhoid in this period and prior to it in the valley of that river?

A. I don't know of any, but I have no doubt there were some few cases.

Q. Having learned from reports of conferences that there was considerable typhoid fever at Cumberland at one time, and subsequently a remarkable increase of typhoid fever in Washington, and not knowing as to typhoid fever any place else, you conclude that the typhoid fever in Washington is attributable to Cumberland?

4576 A. I do.

Q. Your entire knowledge of it has been gained and acquired since about the first of June and since that time?

A. My definite knowledge of it has been acquired since that time, as I have stated, because although I had an indistinct recollection of the facts I did not have them sufficiently in mind or in hand to enable me to speak of the matter upon my previous examination with any confidence. I therefore requested the privilege of going and looking up the matter as I believed it to be interesting and important.

Q. Can you tell me why the cases in January, 1890, in Cumberland didn't show any effect, if they ever had any, in Washington in February?

A. I cannot. There was a slight increase in Washington in January, but it was so slight that I didn't feel it fair to attribute it with any strong presumption or probability to the cases in Cumberland. At the same time—

Q. At what time in the year is the Potomac river at Cumberland in flood?

A. Allow me to finish my answer.

Q. Excuse me.

A. At the same time it is entirely possible that this slight excess in January was due to the cases in Cumberland.

Q. At what time is the Potomac river in flood at Cumberland?

A. I have not learned with any great degree of accuracy 4577 of the flood periods of the Potomac river, or at least beyond the statement of Capt. Gaillard that its flow is very marked, varying from a minimum at Great Falls of about 1063 feet per second to between four and five hundred thousand during the great freshet in June, 1889.

Q. In June, 1889, there was a freshet in the Potomac river, was there, according to the statement of Capt. Gaillard?

A. Yes, there was.

Q. At which time the river flow was about four or five hundred thousand cubic feet per second?

A. Yes, that was June, 1889.

Q. And do you know when there was another flood after that?

A. I do not.

Q. Whether there was any in 1890?

A. No, I do not.

Q. Or in the winter of 1889 and 1890?

A. I do not; but of course it was fair to suppose that with the breaking up of snow on the Virginia mountains and the Alleghenies there must have been the usual spring floods. I have not undertaken to connect closely the typhoid in Washington with the typhoid in Cumberland, believing that no such close connection could be traced to that, but that only a broad and general connection was discoverable.

Q. Do you think that the typhoid fever in Cumberland of 4578 January of 1890 was a contributing cause to the typhoid fever in Washington in March?

A. I do decidedly.

Q. For what reason?

A. Because, as I have already stated, beginning with March there was a continued excess in Washington which, in my judgment, corresponds well with a correspondingly continued excess in Cumberland.

Q. I am asking you only of the month of January. Do you believe that the typhoid fever which occurred in Cumberland in January, 1890, contributed to the typhoid fever in Washington in March of the same year?

A. I certainly do.

Q. On what theory?

A. For the reason that we have good reason to believe that germs of that disease were deposited in the Potomac water at Cumberland. We know that this water travels down the river and is in part at least used for drinking purposes by the people of Washington. We find an otherwise inexplicable excess in typhoid fever in Washington at a time following, when such increase would reasonably be unexpected.

Q. All the water in the Potomac river at Cumberland had flowed past the City of Washington in the Potomac, long before this epidemic or increase of typhoid fever in Washington, that is to say, the water infected, if it was infected, by typhoid 4579 fever in January at Cumberland had flowed past the City of Washington a very considerable time before allowing for the period of incubation, had it not?

A. I should suppose that it must have in a large part. Perhaps entirely.

Q. Then, if the typhoid fever in Cumberland in January contributed to the typhoid fever in Washington in March, the germs must have been deposited somewhere in the meantime?

A. That seemed to me a very decidedly suggestive fact, but I think we should bear in mind that in January it is possible that the stream was tightly frozen and that sedimentation took place to an unusual extent for a time. The so-called self-purification going on.

Q. Is the Potomac river ever frozen between Cumberland and Washington?

A. I have no personal knowledge of it, but I don't see how it can be otherwise. There are many quiet ponds in the stream between Cumberland and Harper's Ferry which I should suppose would freeze over readily, as Cumberland is in the mountains.

Q. Is the Potomac river ever frozen over in those places where there is a current?

A. If the current is not too swift, I should suppose it must have, and certainly the current would be slow in the places that I have spoken of.

4580 Q. Of course, there is no way of determining as an actual fact whether any typhoid fever germs were deposited in any of the sluggish places in the Potomac river?

A. No, sir.

Q. Nor, whether they were washed out so as to contribute to the typhoid fever in Washington in March?

A. No, sir. We can only infer from the end result, what may have happened.

Q. And the belief that typhoid fever in Cumberland was the cause of typhoid fever is based upon the theory that typhoid fever germs live in water and are transported by water and retain their virulence?

A. That certainly is the theory, sir.

Q. And that theory in this case must be applied to a distance of how many miles between Cumberland and Washington?

A. The distance from Washington to Cumberland by river is about 175 miles, but I fancy that that includes the acqueduct and settling basins.

Q. From the intake to Washington?

A. Yes, I believe so.

Q. So that the distance from Cumberland, say, to the intake at Washington is possibly 165 miles?

A. Well, about 160 miles perhaps.

4581 Q. 160 miles?

A. 160 to 165.

CROSS-EXAMINATION, by Mr. Todd.

Q. What was the sewerage system in vogue at Cumberland in 1890, Professor?

A. There was no regular system of sewerage, but there were some short private sewers, and according to the best information I can obtain, privies overhanging the streams then as they now do, and draining into the runs, which contributed to the river; to some extent also night soil was emptied near the stream according to a statement made by one of the physicians, and the banks being quite steep in that neighborhood, no doubt a good deal of the excrement found its way into the stream, but I think there was no regular system of sewers.

Q. What percentage of the sewage at Cumberland found its way into the Potomac river?

A. That would be impossible for me to answer, or for anyone to answer.

Q. What proportion of the population of Cumberland resided immediately on the banks of the Potomac river and Wills creek and the two little runs?

A. I can't say accurately, but I should suppose perhaps 4582 one-third to one-half.

Q. How far does the town of Cumberland extend back from the Potomac river?

A. Today it extends perhaps an average of one-third to one-half miles.

Q. To what extent along the river does the City reach?

A. That is also difficult to answer because it extends from the Chesapeake and Ohio Canal to Wills Creek and also to the little runs in another valley and to the Potomac in the third, but I should say, without speaking accurately, it was about a mile.

Q. At the town of Cumberland are the banks of the river high or low?

A. On Wills creek the banks are tolerably high. On the runs they are low, and also on the Potomac.

Q. On the Potomac do the houses front on the river, or are they situated so that the rear is on the river?

A. As I remember it, there were comparatively few houses upon the Potomac, and I should say that they for the most part fronted on the river, their backs often reaching to little runs to which I have referred.

Q. How many privys did you observe that overhung the banks of the Potomac?

4583 A. I did not see any on the banks of the Potomac proper, but I did not go very far up that stream.

Q. How many did you observe on the banks of the creek overhanging the banks of the creek when you were there?

A. I think I counted about thirty or forty, and, as far as I could see up the stream, they were still in evidence, but I did not go up to count them.

Q. Do you know what system is in vogue for the receiving of the fecal discharge in connection with the residences that are located along the creek and along the Potomac?

A. At that time?

Q. Yes.

A. As near as I could learn, there were a good many box privys and some private vaults, the usual arrangements of rural or semi-rural communities, but these privys and private vaults to a great extent emptied upon the banks of the stream. I have here a definite statement upon this from a physician, Dr. H. V. Miller, of Cumberland, who says that the entire outlet for waste material here is the Potomac river. The closets are cleaned and refuse deposited on soil drained into the dump, direct into the river, while many closets and sewers open direct into streams which flow into the river.

4584 Q. Have you any information as to the number of typhoid cases or deaths that occurred in the houses where the privys overhung the stream?

A. No, sir, I have not.

Q. Have you any information as to the number of typhoid deaths that were in houses that used private vaults?

A. No, sir.

Q. When the fecal discharge of a typhoid patient is deposited into a private vault, how long under those conditions in your judgment would the bacteria of typhoid live?

A. This is a difficult question, but in my judgment some of them might live for weeks or months, or even years.

Q. Have you any information as to how often the privy vaults and box privys were cleaned and the refuse dumped into the Potomac?

A. I have not.

Q. In order to form an accurate conclusion as to the effect of the typhoid fever in Cumberland, wouldn't it be necessary to ascertain that fact?

A. I think not under the then existing circumstances. There was in Cumberland a very extensive epidemic of typhoid fever. During a part of that period the water of the Potomac
at Washington was apparently pumped very directly to
4585 the people. A remarkable excess of typhoïd fever ap-
peared soon after in Washington, which excess continued
over a number of months, corresponding well to the duration of the excess in Cumberland; and, although some of the germs in Cumberland doubtless lived beyond the period of the Washington epidemic, the ordinary processes of purification of the

water supply in Washington were such that no unusual effects were discoverable from them. It should be remembered, however, that typhoid fever is almost always excessive in Washington, and I believe that this regular excess is in a large part due and long has been due to a limited number of cases occurring in Cumberland, so that a small infection surviving or proceeding from box privys emptying into the river after this period would, in my judgment, keep up the usual excess of typhoid in Washington. It might not materially add to it.

Q. Have you any information as to how often the privy vaults of Cumberland were cleaned or renovated?

A. No, sir.

Q. Have you any information as to whether the fecal discharge from typhoid patients in Cumberland was treated by the application of any antiseptic?

A. I have not.

Q. If it should appear that under the direction of the doctors such antiseptic precautions had been taken, would not you deem it necessary to ascertain that fact in order to draw a 4586 correct conclusion as to the effect of the sewage of Cumberland upon the Potomac River?

A. No, sir. I should not, broadly speaking, because it is well known that any such general order for such disinfection, or any such practice of disinfection, is always only partially obeyed, and I should rather believe that the moderate character of the excess in Washington, which I have hesitated to call an epidemic, was in part due very likely to some such disinfection. If there had not been some means of destroying these germs in part at the start or en route, in my judgment the effect in Washington would have been much greater than it was; and the very fact that it was great, but not appalling, seems to me to fit in admirably with all the known circumstances and conditions at Cumberland on the river and in Washington.

Q. If the facts should appear that a disinfectant was employed and that these privy vaults where the typhoid fever feces or excrements was emptied, were not cleaned or renovated oftener than six months, would that fact be necessary to ascertain as shedding any light upon the infection which the Potomac river received from this typhoid condition at Cumberland?

A. I think that the ascertaining of such a fact would be interesting and vauable, but I do not consider it as in any way
indispensable to the present inquiry, because in this case
4587 particularly, so many privys overhanging the creek and
the runs must, with the abundance of typhoid fever in
Cumberland, have delivered uninfected feces to the river, that any such inquiry would be somewhat academic rather than practical in my judgment.

Q. Then you do not regard as essential the establishment of the fact as to whether the fecal discharge of typhoid patients had been treated to an antiseptic or not, or whether the houses whose night soil was emptied into the river were inhabitated by typhoid cases or not in arriving at your conclusion as to the pollution of the Potomac river?

A. I certainly do not in the present case, because even if there had been a general order by the municipality to disinfect, I am sufficiently familiar with the small effect of any such order to have learned to disregard it, and, besides, in the present instance there is no reason to suppose any such order was given, or even in part obeyed.

Q. Do you know as a matter of fact whether such an order was given?

A. I do not.

Q. Do you know as a matter of fact whether it is a practice of physicians in Cumberland to disinfect the fecal discharge or the exhumentia of typhoid patients?

A. I do not, but I have no doubt that it was the custom
among the best physicians in Cumberland to advise the
4588 families having the typhoid patients to do such disinfecting.

Q. Do you know whether the privys that received the exhumentia of the typhoid patients were emptied into the Potomac river or not?

A. I do not.

Q. Then, in the absence of any knowledge with regard to that fact whether the sewage was or was not emptied into the Potomac river, how are you able to predicate an opinion that it was?

A. I do not remember that I have predicated that, but I have no doubt that the practice of the people which appears to have been of that sort was to a greater or less extent at any rate continued even during and after the epidemic; but in any event many mild cases must have contributed germs to privys which were emptied as usual, the patients and their friends themselves not knowing that this disease had been in the family. Cases of this kind are very common in all grave epidemics.

Q. Is it not a fact that in attributing the increase of typhoid fever in the City of Washington you predicated that increase upon the assumption that some of the exhumentia of the typhoid patients in Cumberland did find its way into the Potomac River?

4589 A. Certainly.

Q. And do you as a matter of fact know whether it did or not?

A. I think I may say that I do.

Q. How do you know it except by inference?

A. I think I may say that I know it because to begin with a large amount of the excreta of typhoid patients must have gone into the river before the people themselves were aware that the typhoid epidemic was in their midst. Many of them were in the habit of using the overhanging privys already referred to and it is inconceivable that, with an epidemic of the extent of that which prevailed in Cumberland in January, 1890, a considerable amount of such material should not have found its way into the river even before the people were aware of the fact. Later, when they had become aware of the fact, necessity and custom, combined with such ignorance of these matters, as often prevails in the lower classes of the community would have caused them to continue to use their ordinary means of sewage disposal, so that I think I may say that I know that typhoid excreta must have found access to the river.

Q. If you know that to be a fact, is that knowledge based upon any personal investigation made by you at that time?

A. Not at that time in Cumberland.

4590 Q. I am speaking about Cumberland. Is that knowledge based upon the knowledge of anyone who made a personal investigation of the conditions at that time?

A. I think I may say that it is, inasmuch as I base my opinion partly upon the investigation made at that time by Dr. Kober of Washington, and Dr. Wiley, a physician of Cumberland.

Q. Professor, when you state that you know, do you use the word "know" synonomously with the word "opinion?"

A. No, sir. I mean by the use of the word "know" that I have a knowledge of the facts in this instance such as I have of many of the scientific facts which I hold, based partly upon my own experience and partly upon the investigations of others, and partly upon general principles.

Q. Do you know whether during this period that the typhoid conditions in Washington existed as you have related them, whether there was any typhoid fever at Harper's Ferry or not?

A. I have not learned of any.

Q. If there should have been 15 or 20 cases of typhoid fever at Harper's Ferry, would that in your judgment be enough typhoid fever to be attributed to account for the increase in Washington?

A. I should need in that case to know whether Harper's Ferry had had a similar outbreak before, and, if so, what 4591 the effect of that had been upon the typhoid rate in Washington. I should also wish to know if these 15 cases were contemporaneous, so as to cause a comparatively heavy infection of the river. I should further wish to know whether the privys at Harper's Ferry overhung the river, and therefore am unable to answer that question off-hand.

Q. Did you take any steps to ascertain whether those conditions existed at Harper's Ferry at this time and at this period?

A. Only by way of general inquiries in Washington and Cumberland.

Q. Did you make any inquiries from anybody at Harper's Ferry who would be most likely to know of the conditions there?

A. I did not.

Q. In order to ascertain those conditions you would deem it necessary to find out the facts from someone who was in possession of them, would you not, as to Harper's Ferry?

A. Well, as to an epidemic?

Q. Yes.

A. Certainly, if I had reason to suppose that there was an epidemic in Harper's Ferry I should want to go there and find out about it; but in this case, having a great epidemic at Cumberland, and being unable to learn of any at Harper's Ferry, I didn't think it necessary to visit Harper's Ferry. 4592

Q. Did you make any inquiry specially as to whether there was any typhoid fever at Harper's Ferry or not from anyone that lived at Harper's Ferry?

A. I did not.

Q. Did you make any special inquiries from anybody who had visited Harper's Ferry who was not a resident there to ascertain that fact?

A. No, I made no inquiries except of the health authorities in Washington and in Cumberland.

Q. Would the health authorities in Washington and Cumberland know the conditions at Harper's Ferry?

A. I think they would, because they were acquainted with this epidemic and knew its importance and interest.

Q. Do you know whether he made any investigation at Harper's Ferry to ascertain the conditions that existed there at this time?

A. I do not.

Q. And whether typhoid fever existed at Harper's Ferry at this time or not you have no knowledge, Professor?

A. I have no personal knowledge.

Q. You can conceive of conditions in Harper's Ferry that would account for the increased typhoid cases in Washington, could you not? 4593

A. I could, although it would be comparatively difficult, because Harper's Ferry was at that time, and it is now I dare say, very much smaller than Cumberland.

Q. You are acquainted with the typhoid epidemic that occurred at Ithaca, New York?

A. In a general way.

Q. Do you recall now how many cases of typhoid were there?

A. About a thousand, I should think.

Q. And that thousand cases was attributable to some laboring men up on a creek, was it not?

A. I believe so.

Q. If that condition should obtain at Ithaca from a camp of laboring men, a like condition could obtain in Washington from any infected town between Washington and Cumberland, could it not?

A. No, sir. It does not seem to me that the cases are parallel, because Six Mile Creek at Ithaca is a small stream, and the Potomac is a large one, and a good deal of the time Washington was protected by this sedimentation basin to a certain extent, and Ithaca was not. It seems to me that the cases are so different as not to be closely comparable.

4594 Q. Do you know how many cases of typhoid existed between Cumberland and Washington along the watershed of the Potomac?

A. I do not.

Q. Did you make any investigation to ascertain the number?

A. No, sir. I had no reason to suppose that there was any unusual number. Of course there are always cases along a stream of that sort, and, as I have already said, there has long been typhoid in Washington, which, I have no doubt, is due in a large part to such pollution; but this was an unusual and extraordinary phenomenon.

Q. You made no investigation to ascertain the number of typhoids between Cumberland and Washington, did you?

A. I did not.

Q. And the reason that you didn't do it was because you didn't deem it essential?

A. That's it exactly.

Q. And whether there were a great number of typhoids there or not you are not prepared to say, are you?

A. I am not prepared to say positively, but if there had been I am sure that I should have heard of it.

Q. If you made no effort to ascertain it, how would you have heard it?

A. Because Dr. Kober who investigated the thing at the time would have been in my judgment sure to mention the fact, as he is a careful man. 4595

Q. Then, the fact that no one mentioned it to you is the only ground that you have for believing that there was no considerable amount of typhoid fever within that stretch of 170 miles?

A. Not exactly that no one mentioned it to me, but that no record of it appears in the report of the investigation at that time.

Q. You made no effort to ascertain that fact, did you?

A. No, I did not; I didn't deem it necessary.

WILLIAM T. SEDGWICK.

Adjourned until July 2nd, A. D. 1903, at the Waldorf-Astoria, New York City, at 10:00 a. m.

4596 The Waldorf-Astoria, New York City, July 2nd, 1903, at

10:00 A. M. Parties met pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

Whereupon an adjournment was taken until following day at same place, 10:00 A. M.

4597 The Waldorf-Astoria, New York City, 10:00 A. M., Friday, July 3rd, 1903. Parties met pursuant to adjournment. Present, The Commissioner, Attorney General Crow,
Attorney General Hamlin,
Judge Springer,
Mr. Todd.

ALLEN HAZEN,

called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Attorney General Crow and testified as follows:

Q. Give the stenographer your name, residence and occupation, please?

A. Allen Hazen; residence, New York City. Occupation Civil Engineer.

Q. How long have you resided in New York City?

A. Six years.

Q. Where did you reside prior to that time?

A. I was born in Vermont and resided there until 1888; then lived in Massachusetts with the exception of a part of the

year in Chicago, in 1893. Massachusetts was my legal
4598 residence until 1896 or 1897.

Q. Now where were you educated?

A. I was educated in the public schools of Hartford, Vermont, at the New Hampshire State College at Hanover, and at Thayer School of Civil Engineering, Hanover; at the Massachusetts Institute of Technology, and afterwards for one term at the Technical School at Dresden, Germany.

Q. Now have you studied any branch of science other than civil engineering in your preparation for professional work?

A. I studied chemistry—particularly the chemistry of water supplies, and had the title of chemist at Lawrence.

Q. Have you studied water supplies at any particular places, any particular schools, if so what?

A. No sir, my education was mainly general, and the knowledge that I have of water supplies has been secured in other ways.

Q. Now were you ever at the Lawrence Experiment Station of the Massachusetts State Board of Health?

A. Yes sir, I was at the station in direct charge of the work from the time of my leaving the Institute of Technology in Boston until February, 1893.

Q. Now what was the character of the work at that Lawrence Experiment Station?

4599 A. Investigations were made as to methods of purifying sewage and water and also investigations of problems,—particularly sanitary problems connected with water supplies and sewage disposal.

Q. Was that an institution supported by the Commonwealth of Massachusetts?

A. Yes sir.

Q. Under the control of the State Government?

A. Yes sir.

Q. Is it still in existence?

A. Yes sir.

Q. Now have you ever studied the question of water supplies and sewage disposal on the continent of Europe?

A. Yes sir.

Q. Where?

A. My first visit to Europe was the summer of 1890. In 1894 I spent nearly the entire year in Europe and visited water supply and sewage works of the larger part of the large European cities, and in 1896 again visited a few of them.

Q. Now have you had charge of any investigations in this country as to the disposal of sewage and drinking waters?

A. I was at the World's Columbian Exposition at Chicago in 1893, in charge of the sewage disposal plant; and also 4600 had charge of the inspection of the drinking waters used on the World's Fair Grounds.

Q. Now have you practiced your profession of Sanitary Engineer or civil engineer in any other city in this country than New York City?

A. I was of the firm of Noyes and Hazen in Boston for the years 1895 and 1896. Mr. Noyes then died, and shortly after I came to New York.

Q. What was the business of that firm?

A. Civil Engineering.

Q. Did you make any specialty of water supply and sewage disposal?

A. Yes sir.

Q. Now during your experience as a sanitary and civil engineer you have had various professional engagements, I suppose, in different parts of the country?

A. Yes sir.

Q. Did you have an engagement at Albany, New York?

A. Yes sir.

Q. What was the nature and character of that engagement?

A. I advised regarding the water, particularly with reference to their supply and the means of improving it, and afterwards acted as their engineer for constructing the works.

4601 Q. What was the occasion for your service there at Albany?

A. The death rate in the city was high, and the cause of the high death rate was the sewage polluted condition of the water, and the works built were a filtration plant to purify the water.

Q. Now, have you had any professional engagement at Ithaca, New York?

A. Yes sir, I am engaged there now, building a filter plant.

Q. What is the occasion for that?

A. There was a typhoid epidemic in the winter due to the use of the Six Mile Creek water.

Q. Now have you had any engagement at the State Lunatic Hospital at Harrisburg, Pennsylvania?

A. I built a filtration plant for that institution, yes sir.

Q. For the purpose of purifying the water supply?

A. Yes sir.

Q. Now have you had an engagement at West Superior, Wisconsin?

A. Yes sir, I have built a filter plant there.

Q. What was the occasion of that?

A. The water contained iron, and it was to remove the iron.

Q. Have you had one at Watertown, New York?

A. Yes, I am designing a filter plant which it is hoped to build within a year, if the money is available. 4602

Q. For what purpose?

A. For purifying the water. It received some sewage above the intake.

Q. Have you had a professional engagement as to the water supply at Yonkers?

A. Yes sir, I am engaged in building a filter plant at Yonkers at the present time.

Q. Have you had an engagement at Pittsburg, Pennsylvania?

A. Yes sir.

Q. What was the character of that?

A. I advised the city government as to the character of their water supply and the best means of supplying the city with pure and wholesome water, and afterwards made plans for a filter plant for the city.

Q. Do you know the occasion for the purification of the water supply of Pittsburgh?

A. The water supply was unsatisfactory because it was sewage polluted and caused typhoid fever among the users.

Q. Have you had any engagement at Providence, R. I.?

A. Yes sir, I have advised in regard to filter plant—several plans for filter plants for that city.

Q. What was the occasion of the installing of a filter plant there?

4603 A. The Pawtucket River above the intake is polluted by sewage and wastes from mills and was unwholesome because of that.

Q. Have you had any professional engagement at Washington City, D. C.?

A. Yes sir.

Q. What was the character of that, and the object of that?

A. I have had two such engagements at Washington. First I was a member of a commission composed of Messrs. Hering, Fuller and myself, which reported to the Senate Committee on the District of Columbia, upon the water supply and the means of improving it, and more recently I was engaged by the Engineer Corps of Washington with reference to the plans for the work, and afterwards was engaged to and did make plans for the filters for the city of Washington.

Q. Do you know whether those works are now under construction?

A. Contracts have been let and construction has been commenced.

Q. What was the occasion, of the desire for the purification of the water at Washington?

A. Partly that it was not wholesome because of the sewage pollution which it received.

Q. Have you had any professional engagement at Chester, Pennsylvania?

4604 A. Yes sir, I advised the city in an action which it brought against the water company to compel it to furnish pure and wholesome water.

Q. What, if anything, occasioned the impurity of the water at Chester?

A. Principally the sewage of Philadelphia, which was quite enough.

Q. What stream is that?

A. Delaware.

Q. Have you had any engagement at Trenton, New Jersey?

A. Yes sir, I have advised the city with reference to the quality of its water supply and the means of improving it. The works there have not been carried out as yet.

Q. What is the source of the Trenton, New Jersey supply?

A. It is taken from the Delaware River. The principal reason for wishing to make other arrangements, was the pollution by the sewage of Easton and other cities above.

Q. Have you had any professional engagement with reference to the water supply at Toledo, Ohio?

A. Yes sir.

Q. What was that and the character of it?

A. I was a member of a commission composed of Mr. Benzenberg, Mr. Clark and myself, to investigate the waterworks and make recommendations for the improvement of it, or
4605 for a new supply.

Q. What was the occasion of desiring to change the supply at Toledo?

A. The water is both muddy and polluted. It is polluted by the sewage of numerous cities and towns up the river.

Q. What is the source of the supply?

A. The Maumee river.

Q. Did you have an engagement at Grand Rapids, Michigan?

A. Yes, I was a member of the commission, composed of Mr. Gray and myself, to examine the water works, and report on means for improving them, or substitution of other supply.

Q. Did you have an engagement in Lancaster, Pennsylvania?

A. Yes, I advised with reference to the supply there, and a method of improving or changing the supply.

Q. Did you have one at Millbury, Massachusetts?

A. Yes sir.

Q. What was the character of that?

A. I advised the town of Millbury in a suit which it brought against the City of Worcester to compel it to purify its sewage so that it would not pollute the Blackstone River.

Q. What was the occasion of that pollution, did you say?

A. The river was polluted by the sewage of the city of Worcester.

4606 Q. Do you know whether or not at the time of this litigation and the time of your advice, there was sewage purification works in operation at Millbury?

A. Worcester had established a sewage purification plant as it had been required to do as a result of the action which Millbury had brought against it. Prior to that time its purification plant was only partial. Since that time the Court has compelled a greatly extended and improved character of the plant, so that the stream has been much more satisfactory than it had been prior to that time.

GENERAL HAMLIN: I move to strike out everything in that answer regarding the suits and complaints and results of suits at Millbury.

Q. GENERAL CROW: Mr. Hazen, have you ever advised in a professional capacity, the Ohio State Board of Health, if so, with reference to what?

A. I acted as consulting engineer for the Ohio State Board of Health for a few years, and advised them in regard to a number of special problems and also made a general and preliminary report on the question of stream pollution in the State of Ohio.

GENERAL HAMLIN: When was that?

4607 A. I think in 1898 and 1899; I wouldn't be perfectly sure without consulting my records—1897 and 1898, I think.

Q. GENERAL CROW: Did you visit Chicago in 1891?

A. Yes sir.

Q. Did you have any occasion to become familiar with the general conditions from a standard sanitary standpoint of that city at that time?

A. I was much interested in the question and I met several officers and others interested in the matter and saw something of the waterworks and sewage disposal at that time.

Q. And did you become generally familiar with the conditions that then obtained?

A. In a general way, yes.

Q. Did you do any work with Professor Sedgwick on the question of typhoid fever in Chicago?

A. Yes sir.

Q. What was it?

A. After that visit I secured additional data and worked them up with Professor Sedgwick and wrote a paper, jointly with him upon the typhoid fever in Chicago, which was published.

Q. Was that with reference to the water supply?

A. Yes sir.

Q. That was in 1892, was it?

A. That was in 1892?

4608 Q. Later did you make another investigation of your own of the drinking waters of Chicago, and publish it in 1894?

A. Yes sir, that was a report which I made on the drinking water used in Jackson Park during the World's Fair period. I also wrote a paper jointly with Professor Reynolds, who was then and I understand is now, Health Commissioner of Chicago, upon the water supply of Chicago, which was presented to a meeting of the American Public Health Association held in Chicago in 1893.

Q. Did you ever have occasion to examine sewer plans and water intakes of Chicago?

A. I did.

Q. Did you ever make any maps showing the location of sewer outlets and water intakes for different periods?

A. I did.

Q. What time was that?

A. I do not now remember the precise periods, but I made maps showing the position of the intakes and sewer outlets for several periods, which maps were also arranged to show the typhoid death rates, which were observed with those conditions.

Q. Have you ever visited the Chicago River and the North and South branches thereof?

A. Yes sir, I saw them frequently during 1893 and since that time I have observed the Chicago River itself frequently when I have been there—when I have been in 4609 Chicago. The branches less frequently.

Q. Were you ever at Joliet?

A. Yes sir.

Q. Have you observed the Canal and the river at that point?

A. Yes sir.

Q. Have you been at LaSalle, Illinois?

A. Yes sir, I was at LaSalle in 1893. I examined the waterworks at that time.

Q. You saw the Illinois river?

A. Yes sir.

Q. And the canal?

A. Yes sir.

Q. Which canal?

A. I think it is the Illinois and Michigan Canal—it is the old one.

Q. Did you make any analyses of the Illinois and Michigan Canal water at that time?

A. I did, yes sir.

Q. Have you been in Chicago since 1893?

A. Yes sir, at intervals.

Q. What was the last period of your visit there?

A. I think my last visit to Chicago was January, 1902.

4610 Q. Have you looked at plans for various parts of the sewerage work in the city of Chicago?

A. I have.

Q. Have you ever been through any portion of the sewers while they were in course of construction there?

A. I went through part of the large sewer building, I think in 39th Street.

Q. Have you ever noticed the condition of the Chicago River before and since the opening of what is known as the Drainage Canal?

A. Yes, I noticed it often.

Q. When did you first visit the St. Louis Waterworks?

A. In the summer of 1896.

Q. Were you a member of the Commission to report on improvement of the water supply of St. Louis?

A. Yes sir.

Q. If so, when?

A. I was a member of such commission, composed of Messrs. Williams, Wisner and myself. We were appointed in 1901 and reported early in 1902.

Q. What Williams was that?

A. Benezette Williams.

Q. Of Chicago?

A. Yes sir.

4611 Q. Did you examine the waterworks system, pumping station, settling basins, conduits, reservoirs, and so forth?

A. I did.

Q. Did you examine the intake and the river above the same, up as far as the confluence of the Missouri and Mississippi?

A. I did.

Q. Did you go as far as Grafton and the mouth of the Illinois River?

A. I did.

Q. Did you visit any places on the upper rivers?

A. Yes sir, I visited many places.

Q. Did you investigate any of the sources of pollution above the intake tower upon the two rivers?

A. Yes sir.

Q. Did you make any diagrams and tables of the populations polluting the rivers and their tributaries?

A. Yes sir. I made tables of the populations of the towns on the banks of the various tributaries and of their distances, from the best data that I could get—their populations by the census of 1900, and those matters were plotted in my office.

Q. What records and data did you use in making these diagrams and tables?

A. The data of the census office, and for the maps and distances the census report of 1880 on water power, was 4612 very useful. In addition I had the maps of the geological survey as far as they were available, and various other sources of information.

Q. Did you use whatever Federal Government records that were accessible to you?

A. I did, yes.

Q. Did you secure any data as to typhoid deaths in St. Louis on this investigation?

A. Yes, I got the deaths as reported at the health office. I made no detailed investigation of the methods of securing and recording that data.

Q. At that time did you study the relation of the Chicago sewage to the St. Louis water supply?

A. I did.

Q. And you formed an opinion thereon as a result of these investigations?

A. I did.

Q. That was in the year 1901?

A. In the year 1901.

Q. Since that time, 1901, you have been familiar in a general way with the conditions in St. Louis?

A. Yes sir.

Q. You have paid some attention to the record of typhoid 4613 fever deaths in the city of St. Louis since that date?

A. Yes sir.

Q. Mr. Hazen, I will ask you what has been the effect if any, in your opinion, of the discharge of the waters of the Chicago Drainage Canal, carrying the sewage of the Chicago Sanitary District, into the Desplaines River under conditions existing since January 19th, 1900, upon the water of the Mississippi River along the Missouri shore, and particularly as drawn from the intake tower of the waterworks at the chain of rocks, with reference to its use for drinking and domestic purposes?

GENERAL HAMLIN: That is objected to on the ground that sufficient facts are not stated in the question upon which to base an expert opinion, and no sufficient facts have been testified to by the witness as to the conditions known by him as a matter of fact.

MR. TODD: In behalf of the Sanitary District I join in the same objection.

GENERAL CROW: You may answer the question.

A. I believe that the quality of the water is seriously damaged by this discharge.

GENERAL HAMLIN: I move that the answer be stricken out for the reasons given in the objection to the question.

MR. TODD: The Sanitary District joins in the same motion.

Q. GENERAL CROW: I believe you stated that you 4614 are now and have been since 1901, familiar with the conditions of the water supply at St. Louis city, and from 1893 to the present time familiar with the conditions of the water supply at Chicago, the Drainage Canal and the course it pursues?

A. Yes sir.

Q. You are familiar with the source or the beginning of the Chicago canal, where it commences?

A. Yes,—well, not in detail.

Q. Well, you know where it begins?

A. Yes sir.

Q. You know its distance?

A. I don't recollect the number of miles.

Q. You know where its outlet is?

A. Substantially, yes sir.

Q. At what point is that outlet?

A. The outlet is into the Desplaines river at some point above Joliet; I don't remember precisely.

Q. Do you know what the Desplaines River empties into?

A. Into the Illinois River.

Q. And what the Illinois River empties into?

A. Into the Mississippi River.

Q. At what point?

A. At Grafton.

4615 Q. Do you know the distance from Grafton—or from the St. Louis intake, to the city of Chicago?

A. It is approximately 360 miles.

Q. That is by the water route is it?

A. By the water route, yes.

Q. That is via the Canal, the Desplaines, the Illinois and the Mississippi Rivers?

A. Yes sir.

Q. Now are you familiar with the stream flow in the canal and the Desplaines and the Illinois and Mississippi Rivers in a general way?

A. In a general way, yes sir.

Q. Are you familiar in a general way with the stream flow and velocity of the Missouri and Mississippi Rivers both?

A. Yes sir.

Q. You have made yourself familiar in this investigation of 1901 as to the points of pollution of those rivers above the intake of the St. Louis waterworks?

A. Yes sir.

Q. Were you familiar with the conditions that existed as to the St. Louis water supply prior to 1901?

A. Only by records and by a visit in 1896.

Q. In a general way do you know about the time of flow, 4616 what it would be from the city of Chicago through the canal, the Desplaines River, the Illinois and the Mississippi Rivers, to the intake of the waterworks at St. Louis?

A. I have seen estimates of that. I have no data of my own to compute it.

Q. Now this opinion that you have given as to the effect of the Chicago Drainage Canal upon the waters of the Mississippi River at the intake; what was that based upon?

GENERAL HAMLIN: That is objected to on the ground that the witness cannot give the reasons in direct examination, for an opinion either as an expert or as a witness testifying to facts within his own knowledge.

MR. TODD: I object to it on the ground that it is improper to cross-examine the witness about an opinion that has heretofore been expressed.

Q. GENERAL CROW: Answer the question.

A. It was based upon the facts that the sewage entering the water courses above the intake, was nearly doubled by this discharge; that the distance from Chicago to St. Louis is very considerably less than the average distance of the other points of pollution, from the St. Louis intake; that the mixing of the waters in the channel of the Mississippi is such that the amount of sewage received at the intake is a large part of what it would be if the mixing were complete, and that the times of 4617 passage from the point of pollution to the intake were not sufficient to allow the complete destruction of the injurious and polluting matters discharged.

Q. I will get you to state if you know of your own knowledge, whether or not the waters of the Mississippi and the Missouri and the Illinois rivers commingle at the intake of the St. Louis waterworks?

A. They do.

Q. I will get you to state whether or not you know of your own knowledge, if the waters of the Illinois river or some portion thereof, pass into the intake of the St. Louis waterworks?

A. Yes sir.

Q. Now in view of these matters, I want to repeat the same question I put to you before. Now I will just repeat the same question. What has been the effect, if any, in your opinion, of the discharge of the waters in the Chicago Drainage Canal, carrying the sewage of the Chicago Sanitary District, into the Desplaines river under the conditions existing since January 19, 1900, upon the water of the Mississippi River along the Missouri shore, and particularly as drawn from the intake tower of the St. Louis waterworks at the chain of rocks, with reference to its use for drinking and domestic purposes?

4618 GENERAL HAMLIN: That is objected to upon the ground that the witness has not stated sufficient facts within his own knowledge upon which he can base an opinion. Second, the facts so far as he has stated them, are not true; third, that the question does not embrace a hypothetical statement of facts shown in the record, upon which the witness could base an opinion.

JUDGE SPRINGER: The Sanitary District makes the same objection.

Q. GENERAL CROW: Answer the question, Mr. Hazen.

A. It seriously injures the quality of the water.

CROSS-EXAMINATION,

By General Hamlin.

Q. Mr. Hazen, you have been engaged as a civil engineer in the establishing of filtration plants for how many years?

A. Eight years.

Q. During that time how many plants have you personally and under your direction, installed?

A. Six or seven.

Q. And at what points?

A. The Queens County Water Company—

Q. Name the places?

A. At Far Rockaway, and neighboring towns. The
4619 Rumson Improvement Company is at Red Bank, New Jersey; a plant for the Pennsylvania State Lunatic Hospital at Harrisburg; a plant for the city of Albany; a plant for the Superior Water, Light & Power Company at Superior, Wisconsin; a plant approaching completion at Ithaca; a plant under

construction at Yonkers. I have made designs for several others which I have not myself built. Shall I include them?

Q. How many others, you say?

A. I made plans for the Washington filters, which are building; for the filters at Nyack, N. Y., which were built; and for Pittsburgh, which are not building. That is all I think of now.

Q. When you were in St. Louis as a member of the Commission composed of Mr. Williams, Mr. Wisner and yourself, was that for the purpose of making investigations to establish a filtration plant?

A. Not for that purpose. The question was how best to supply the city of St. Louis with clear and wholesome water.

Q. You were never there for the purpose then of making plans or agreeing among yourselves on the best system of filtration?

A. Not for the purpose of making plans, no sir.

Q. Were you there for the purpose of discussing and determining the question of filtration?

4620 A. Well, that was a part of the main question.

Q. And did you report on that question?

A. Yes sir.

Q. And was that report a unanimous report?

A. No sir, a divided report.

Q. Now, in what way was it divided?

A. Messrs. Williams and Wisner reported for a gravity supply.

Q. From what place?

A. From the Merrimac River.

Q. And what was your report?

A. I recommended the continuance of the Mississippi water with filtration.

Q. With filtration?

A. Yes sir.

Q. At that time the intake was established at the chain of rocks, where it is now, as you understand it, wasn't it?

A. Yes sir.

Q. And you recommended a continuance of that same supply but with filtration?

A. I did.

Q. Did you make any estimate of the cost of filtration?

A. I did.

4621 Q. Do you remember what that was?

A. Not precisely. I could give you an approximate idea of it. It was about $2,000,000 for a filtration plant proper, and Seven or Eight Hundred Thousand dollars for auxilary works, which would be necessary in connection with it. It was something under $3,000,000 for the whole project as required by the present requirements of the city.

Q. Your business mainly then has been in the making of designs and constructing filtration plants, has it not?

A. In a large part, yes.

Q. That is the department of your work upon which you are able to speak advisedly in your opinion, are you not?

A. Yes sir.

Q. Have you ever made any chemical analyses of the water at St. Louis?

A. No sir.

Q. Have you ever made any bacteriological examination of it?

A. No sir.

Q. That is not a department of your work, or has not been, has it?

A. No sir; I have made in years gone by, chemical analyses.

Q. Yes, you did as a student?

A. Something after that, yes sir.

4622 Q. Not as a practical chemist with a view of giving opinions on chemical analyses?

A. To some extent, yes sir, it was.

Q. Well, you wouldn't want to say that you were an expert on that question?

A. Yes sir.

Q. You would?

A. Yes, on the chemical analyses.

Q. But you have made none in this case?

A. No sir.

Q. Now you spoke of three, I think on three different occasions where you were employed to advise in certain suits that were brought by a city against a water company. Do you now remember how many times you have been so employed?

A. No sir, I do not; the list was not nearly complete.

Q. You only gave a few?

A. Yes sir.

Q. In all of the cases that you have mentioned, where you have advised the installment of filtration plants upon the subject of pollution at those places mainly, you have taken the opinions of others, have you not?

A. The opinions of others upon what point?

Q. On the question of water pollution itself?

4623 A. No sir, I have not.

Q. Do you mean to say that you have made a personal examination in each case?

A. Usually, yes sir.

Q. And had not examinations been made by others and reports, upon which you acted and based your opinion on largely?

A. No sir, not generally.

Q. Well, hasn't that been the case in many cases?

A. I don't remember of such a case. I think there may have been, but I don't remember it now. Generally I have been asked to report on the extent and nature of the pollution, and the character of the supply, and have used my own methods for securing the data and have used my own judgment on that point.

Q. Has that been fortified by the opinions and investigations of others?

A. Oftentimes.

Q. Yes, largely so, but I am not speaking about your ability; I am speaking about the fact.

A. Well, as far as my own conclusions are concerned, they have been based on my own investigations, but of course other people's opinions and other reports would no doubt influence my superiors largely, but in my own personal reports I have depended principally upon my own investigations.

4624 Q. Now you take the pollution at St. Louis; you made no chemical analyses of the waters at St. Louis?

A. No sir, it was not necessary.

Q. Well, you did not, that is your opinion, that it was not necessary?

A. Yes sir.

Q. Nor did you make any bacteriological examination?

A. No sir.

Q. So, based upon either of those, you have no knowledge at all other than what you got from some other source, have you?

A. No sir.

Q. And you did take from other sources there, did you?

A. I had analyses from other sources. The deductions to be drawn from those were entirely my own.

Q. That is true upon any other proposition; you draw your deductions based upon something?

A. Yes sir.

Q. Now isn't that true largely now, Mr. Hazen where you have installed filtration plants, most anywhere?

A. That I have depended upon the conclusions of others?

Q. To a large extent?

A. No sir.

Q. You have not depended on them?

A. On analyses?

4625 Q. Yes, and bacteriological examinations and reports?

A. Not to any large extent.

Q. Take in the Ohio case, now, did you have a report of the State Board of Health?

A. Yes sir.

Q. Showing the conditions as they found them?

A. Yes.

Q. And you drew deductions from those reports, did you not?

A. From those reports and the other facts in the cases.

Q. But your main business was to install filtration plants?

A. No sir. In that case not at all.

Q. Well in many cases it was?

A. Yes.

Q. And you drew the designs, made the plans and estimated the cost?

A. Yes.

Q. Now in the majority of cases that you have given, isn't that true, that that has been your main business, to draw the plans and estimate the cost?

A. I don't think in a majority; in a large number of cases.

Q. It has been in a large number of cases?

A. Yes.

Q. And have you superintended the work?

A. Yes sir.

4626 Q. In most of the cases that you have mentioned did you superintend the work?

A. In most of them unless I have mentioned otherwise.

Q. Then you have a practical knowledge as well as a professional knowledge of the construction—of the actual construction of this kind of work?

A. Yes sir.

Q. And that is your main business, is it not?

A. It is a large part of my business.

Q. Have you ever traveled over the drainage canal and down the Illinois river and the Mississippi, to St. Louis?

A. Not over the whole distance, no sir.

Q. You have been as far as Joliet and LaSalle?

A. Yes sir.

Q. Not any further?

A. Not in that direction.

Q. Well, that is not a great ways down the Illinois River, is it?

A. It is something like 100 miles up to LaSalle, as I remember it.

Q. Well, that is not a great ways if that distance is true?

A. No sir, it is something like one-fourth.

4627 Q. You are not certain that that is the correct distance to LaSalle?

A. Oh no, that is just my general recollection.

Q. You don't know as a matter of fact?

A. I have a record of it; I haven't it in my mind just now.

Q. You are of the opinion then, as I believe you stated in your report, that there should be filtration at St. Louis?

A. Yes sir.

Q. The Mississippi River at St. Louis is composed of what streams; that is, what main streams?

A. In the immediate neighborhood are the Mississippi and the Missouri and the Illinois enters the Mississippi on the other side a little further up.

Q. It would not cost any more to establish a filtration plant, if one was necessary, if the Mississippi did not receive the waters of either the Missouri or of the Illinois, would it?

A. If the Mississippi did not receive the waters of either the Missouri or the Illinois?

Q. Yes, or the Illinois?

A. I think it would, because the character of the water of the upper Mississippi is very different.

Q. I am not speaking about water; I am assuming now that filtration is necessary?

4628 A. It is necessary for me to state this please. The water—

GENERAL HAMLIN: Question withdrawn.

GENERAL CROW: Just put your answer in the record.

GENERAL HAMLIN: Oh no, he can't put an answer in when I withdraw the question.

GENERAL CROW: He has a right to put his answer in the record.

GENERAL HAMLIN: I am running this side of the case.

GENERAL CROW: Let him finish his answer.

GENERAL HAMLIN: Just answer this question and then you can put in anything you like—

GENERAL CROW: Let's put it in right here. This is the place it belongs.

GENERAL HAMLIN: He can answer all the questions he has a mind to after he answers this one—

THE WITNESS: The water of the upper Mississippi is different physically from the water of the Missouri, and I have not said—

GENERAL HAMLIN: I knew what you were going to say. That is why I was going to change the question. Put it in.

A. (Continuing) I have not studied the kind of plant which would be necessary for the Mississippi water above the

Missouri, but I think it would be very different from the
4629 plant required for the Missouri river water. Whether it would cost more or less, I don't now know.

Q. Now you understand the Missouri river water to be rather muddy?

A. It is very muddy.

Q. A very muddy stream?

A. Yes sir.

Q. Well then, would it cost any more to establish filtration plants, suppose that you eliminate the Illinois River and put in the Missouri and the Mississippi river?

A. It would make no substantial difference.

CROSS-EXAMINATION,

By Mr. Todd.

Q. When did you first examine the sewage system of St. Louis?

A. The sewerage system?

Q. Yes?

GENERAL CROW: I didn't ask him anything about that, and he didn't testify to that. It was waterworks system.

MR. TODD: I understood that the question was that he had examined the sewerage system and water systems of St. Louis.

GENERAL CROW: I didn't mention that. I meant of Chicago.

4630 Q. MR. TODD: When did you first become acquainted with the water system of St. Louis?

A. In 1896.

Q. What was the purpose that led you to the investigation of the water supply of St. Louis in 1896?

A. I was in the city for a day or two, on some business, and having time, and having met the engineer of the works, I looked them over.

Q. When did you next give the water supply of St. Louis consideration?

A. In July, 1901, upon my appointment upon a commission for that purpose.

Q. In 1896, what in your opinion was the condition of the water supply of St. Louis?

A. I didn't investigate it at that time in a way to enable me to have an opinion of its quality.

Q. In 1896 did you consider the waters of the Mississippi above the intake as a safe and potable water?

A. I didn't know much-about it.

Q. In 1901 you made a more careful examination, did you?

A. Yes sir.

Q. Will you state what examination you made, in detail?

A. I visited the various pumping stations, intakes, reservoirs, conduits; examined the plans of them on file in the
4631 municipal offices; and I went on the city boat up the river and noticed particularly the conditions of flow and mixing, where the Missouri comes into the Mississippi, and where the Illinois comes into the Mississippi, and the channel. I visited a number of places up the Mississippi and Missouri rivers. That was incidental to other studies however, and not for this direct purpose. I went over the watershed, using the maps and the census reports as I have stated; found the names of all the considerable cities and towns on the watersheds, and their populations by the census of 1900, and got the distances that they were above the St. Louis intake, by the best obtainable data, using the United States census report of 1880 and figures from Government engineers, and where I couldn't get direct data from map measurements. For the chemical and biological character of the water, I examined all the old records, which were very full at St. Louis, and the records of Mr. Teichmann and others were also put at my disposal for studying that question.

JUDGE SPRINGER: That was in 1901?

A. 1901.

Q. MR. TODD: Did you examine the waters of the Missouri river?

A. Only as I saw it going into the Mississippi—wait
4632 a minute; that is not correct. I examined the plants of the waterworks at Kansas City, Kansas; Kansas City, Missouri, St. Joseph and Omaha, to find out the character of the Missouri water and the methods which were necessary to treat it and the results which could be secured by those methods.

Q. In your examination of the Omaha waterworks, did you ascertain whether the sewage from the city of Omaha and Council Bluffs entered into the Missouri river?

A. I assumed that it did; I didn't ascertain it at that time.

Q. Did you examine it as to whether the sewage of Kansas City, Kansas, Kansas City, Missouri,—emptied into the Missouri river?

A. I assume that it did. I examined some sewers in that case.

Q. Did you examine as to whether Jefferson City emptied its sewage into the Missouri river?

A. I assumed that all of the cities on the watershed sewered into the water courses.

Q. And what effect did you assume this sewage to have upon the water—the quality of the water of the Missouri river, before it emptied into the Mississippi?

A. It injured its quality.

4633 Q. Did you consider it a safe and potable water?

A. No, sir.

Q. Do you consider it so now?

A. No, sir.

Q. A safe and potable water?

A. No, sir.

Q. If the Illinois river could be dammed at its mouth and a channel cut whereby it should empty below the intake tower of the City of St. Louis, would you consider the water of the Missouri and Mississippi which entered the intake tower at St. Louis, a safe and potable drinking water?

GENERAL CROW: Complainant objects for the reason that the character of the water of the Missouri and the Mississippi, as to whether it is safe and potable, is wholly immaterial to this inquiry.

A. No, sir.

Q. MR. TODD: Assuming that a channel cut from the Illinois river should empty into the Ohio at Cairo, thus eliminating entirely the Illinois river water from the Mississippi between Cairo and Grafton, would you consider the water of the Mississippi at Cairo a safe and potable drinking water?

GENERAL CROW: Complainant objects for the reason

that the character of the water of the Mississippi and the
4634 Missouri aside from the Illinois, is wholly immaterial in
this inquiry?

A. No, sir.

Q. Mr. Hazen, if you were to venture an opinion as to the character of the Mississippi river water above Cairo, would you consider that its character was made unwholesome and unpotable by the addition of the sewage discharged into the Mississippi river by the cities of St. Louis,—and the cities in Missouri emptying their sewage into the Mississippi river, as well as the cities on the Missouri, emptying their sewage into the Missouri river?

GENERAL CROW: Complainant objects to that question for the reason that it is wholly immaterial in this inquiry as to what effect sewer outfalls of cities of the Mississippi and the Missouri may have in their effect upon the water of the Missouri and Mississippi rivers.

A. I think that the discharge renders the waters less wholesome and less potable. I cannot say that it renders it unwholesome and unpotable because it may be that it would be unwholesome and unpotable without them.

Q. In my hypothetical question I am assuming that the waters of the Illinois are eliminated by this supposed channel.

A. Yes.

Q. Now, consider the addition to the waters of the Mis-
4635 souri and the Mississippi, of the sewage discharged by
the towns in Missouri into the Mississippi, as making that water an unsafe and unwholesome water for drinking purposes, without being treated.

GENERAL CROW: Complainant objects to this question for the reason that the effect of the sewage of the Missouri river towns and the Mississippi river towns entering into the rivers, making the waters of the Missouri and the Mississippi rivers unwholesome, is immaterial to this inquiry.

A. As I understand it, this quesiton is substantially the same as the last one, and my answer would be the same.

Q. MR. TODD: What do you mean by the comparative term "less wholesome" and "less safe" as a sanitary engineer?

A. I mean that they would produce, or might produce, more sickness and more deaths among those who used the water.

Q. Assume that the waters of the Mississippi above its confluence with the Missouri and the Missouri above Kansas City, Missouri, were non-polluted streams, and assume that the sewage discharged into those rivers by the cities in Missouri such as Kansas City, Missouri, Jefferson City, St. Charles, St. Louis and the other smaller towns that empty their sewage into those rivers, would you consider the water of the Mississippi river above Cairo a safe and potable water?

4636 GENERAL CROW: Complainant objects for the reason that the effect of the sewage of the towns mentioned in the question in the waters of the Mississippi and Missouri river is wholly immaterial in this inquiry.

A. I should not, off-hand. It is a question that I have not studied in detail.

Q. You know the population of Kansas City?

A. Approximately.

Q. You know the population of St. Louis?

A. Yes.

Q. You know approximately the population of the cities in Missouri that empty their sewage into the Missouri and Mississippi rivers, do you not?

A. I have looked them up and listed them.

Q. What further facts would you need to be put in possession of in order to form an opinion as to whether that water was a good, safe, drinking water under the conditions pre-supposed in the previous question?

A. A good safe drinking water is a relative term.

Q. I would like to modify that question—a good safe drinking water in the language employed by sanitary experts?

A. A good safe drinking water is a relative term. There are waters polluted so slightly or so remotely that notwithstanding the fact of pollution, they are reasonably good waters.
4637 The amount of dilution and the period of time between the point of pollution and the point where the water is used are matters which have to be considered. In some cases I have studied these matters in detail and have formed judgments upon them. In this hypothetical question which you put to me, I give you my impression, but I have not made computations concerning it as I certainly should do if the question was presented to me for a professional opinion.

Q. Would you consider the water of the Mississippi river above Cairo under the conditions existing in the hypothetical question, but with the additional information as to the rate of current and time of flow in the Missouri river, and the Mississippi river, a reasonably safe drinking water after it had received the addition of the sewage from these different cities?

GENERAL CROW: The cities in Missouri?

MR. TODD: Cities in Missouri.

GENERAL CROW: Complainant objects to the question for the reason that the effect of the towns and cities on the Missouri and Mississippi rivers is immaterial to this question, the question being on the pollution of the Illinois river, and its effect upon the water supply of St. Louis.

A. I think not.

Q. MR. TODD: Will you explain to what extent it
4638 would not be a reasonably safe drinking water, and what
do you mean by that term?

A. There are some waters that are so polluted that they cause death of more than one person from typhoid fever for each thousand people living, and seem to cause—although the evidence is less conclusive, but it is very good—and seem to cause the death of four or five people altogether per annum, per thousand living, and water that does that is about as bad a water as is used anywhere in this country at this time. Waters that are less polluted than that produce smaller amounts of sickness and death. The question comes as to where to draw the line. It may be a question whether even almost the best waters that we have are absolutely free from suspicion of causing sickness and death, but when a water causes so little that it cannot be certainly traced, and measured, we class it as a good water, and the point at which that line is drawn is not and cannot be a sharp line. It is going down. A water that classed as good twenty years ago is classed as bad now, and a water that satisfies us today probably will not satisfy the most exacting people a generation hence.

Q. Mr. Hazen, assume that in the southeast corner of the State of Missouri a company was about to establish a large city, and conditions existing along the Mississippi river above that point were such as are contained in the hypothetical ques-

4639 tion, and you should be selected as the sanitary engineer to look out for its water supply; knowing the conditions such as I have assumed them in the hypothetical question, and before you could ascertain whether this water was going to kill anybody or not, what would you say as to whether the waters of the Mississippi under those conditions, would be a safe drinking water for the future inhabitants of this supposed city, without being artificially treated?

GENERAL CROW: Complainant objects to that question for the reason that the inquiry is not as to the effect of the sewage of towns in Missouri upon the Missouri river and Mississippi river, but upon the effect of the sewage of Chicago by way of the Illinois river into the waters of the Mississippi river, and therefore the matter inquired about is wholly immaterial.

A. I think not.

Q. That is, you wouldn't consider that water a safe drinking water?

A. No, sir.

Q. Assume that the Illinois river should be diverted to Cairo in the manner I have indicated, and knowing all the conditions that obtain upon the upper watershed of the Mississippi and the Missouri rivers as they do today, and the water system in St. Louis as it now exists, would you consider that
4640 water a safe drinking water for the people of St. Louis?

GENERAL CROW: The complainant enters the same objection to this question as to the question immediately preceding.

Q. MR. TODD: Treated the way it is today?

A. I think I have already answered that question.

Q. I don't think so. You have answered one similar, but not exactly the same.

A. It is assuming that all the conditions upon the upper water shed are the same, except that the drainage canal is out?

Q. Oh, no, the waters of the Illinois river.

GENERAL CROW: The waters of the Illinois river were out of the other question too.

A. I should not.

Q. Then the cities bordering upon the Illinois river, and the conditions that obtained prior to January 17th, 1900, would not make the water supply of St. Louis a safe and usable water supply under existing conditions, in your judgment, would it?

GENERAL CROW: Complainant objects to that question for the same reasons given above.

A. No.

Q. MR. TODD: You have stated that you made an investigation in connection with Professor Sedgwick in regard to the conditions of typhoid in the city of Chicago in the year 1892? 4641

A. Yes, is.

Q. Your conclusion at that time was to the effect that the cause of typhoid in the city of Chicago resulted from the sewage that entered Lake Michigan and got into the water supply of the city?

A. Yes, sir.

Q. Had anyone else arrived at that conclusion before you and Professor Sedgwick did, that you know?

A. I presume so.

Q. You were aware of the fact that the Legislature of Illinois had passed what is known as the Sanitary District Act in 1889, based upon the fact that the sewage entering Lake Michigan was the cause of the contamination and infection of the water supply of Chicago, and that the canal was built for the purpose of diverting that sewage from Lake Michigan?

A. Yes, sir.

Q. You said you were acquainted with the intercepting sewer systems of the city of Chicago?

A. At present or then?

Q. At present?

A. In a general way, yes.

Q. What are the purposes of the intercepting sewer system that you investigated there the last time you were there?

4642 A. To keep the sewage of Chicago from entering the lake, and diverting it to the drainage canal.

Q. How extensive is that sewerage system?

A. It is very extensive. Portions of it were already in service, and a large part discharging through this 39th Street sewer was to be diverted soon. I don't think that has yet gone into effect, and there were still some districts of the city, not the most densely populated ones,—that were entirely outside of the district served by the sewers now under construction or immediately contemplated.

Q. Have you ever investigated the waters of Lake Michigan?

A. Yes.

Q. Are the waters of Lake Michigan a safe and potable water, exclusive of the sewage of Chicago and of the outlying territory immediately north and south of Chicago that empties into Lake Michigan?

A. That is, would it be if that sewage was excluded?

Q. Yes, would it be?

A. Yes, sir.

Q. You traced the cause of the typhoid in Chicago to the sewage contaminated water that entered the intake and thence came back into the water supply of the city, did you?

A. Yes, sir.

4643 Q. Assuming that the Calumet district on the south and Evanston upon the north should be added to the Sanitary District of Chicago, and the sewerage system of Evanston should be diverted from going into Lake Michigan, but was directed through the Lawrence Avenue conduit to the North Branch channel that is in contemplation of improvement, and into the Chicago river; and the Calumet district on the south should be diverted from Lake Michigan into the drainage canal by way of the Sag; what effect in your opinion would that system of sewerage have upon the water supply of the City of Chicago?

A. It would improve it.

Q. When the entire sewage from the population from Evanston on the North to the Indiana line on the south is diverted from Lake Michigan, will not the waters of Lake Michigan become a safe and potable water?

A. They will if you go out far enough.

Q. How far would you consider it necessary to go?

A. I could not give you an estimate off-hand.

Q. How far from shore are the intakes of the water supply of Chicago?

A. At the present time I think the nearest ones are about two miles, and the principal ones are four or five miles.

Q. Would you consider that a safe distance from shore?

4644 A. Not necessarily.

Q. Would you consider it an unsafe distance from shore with the sewage from the city being diverted?

A. With the sewage diverted?

Q. I am speaking of conditions when the sewage was diverted from Lake Michigan?

A. I couldn't say that off-hand. You would still have a source of pollution from your shipping, and possible overflows which occur on even the best designed system of sewers sometimes, and I don't think the water in shore for those reasons would be altogether safe.

Q. Assuming that you are in error in regard to the possibilities of an overflow from the present sewerage system of Chicago when fully developed, going back into the lake, which I am informed to be a fact, that such a condition can never obtain when the sewerage system is completed, would that change your opinion as to the potable condition of the waters at the present intakes?

A. It would improve the condition, but you still have youi shipping to contend with. I don't think the water directly in the city would be safe. How far you would have to go out I cannot say.

Q. What effect would you attribute to the shipping as a

4645 source of contamination of the water supply of Chicago?

A. It is an element, I could not say how important an element; in many cases, in waters of rivers and lakes, the pollution from shipping has been found from investigation to be quite an important element.

Q. How far are the intakes of the City of Chicago located from the line of ships that enter the Chicago river?

A. I could not say.

Q. Most of the sewage discharged by the ships would enter the Chicago river as a matter of fact would it not?

A. That discharged by the ships when they were in port would do so, yes, sir.

Q. And the amount of sewage discharged by ships leaving port would amount to a very small amount, would it not?

A. It would amount to something.

Q. Would it be enough to be a menace to the water supply of Chicago?

A. I think it might be.

Q. In what way?

A. Polluting it.

Q. Could you tell how the ships leaving the Chicago Harbor would contaminate the water supply at the 12th Street crib, or at the Hyde Park crib, and the South Chicago intake?

A. The shipping up and down the lake from other en-
4646 trances than the Chicago river—from the Calumet river—
pleasure boats, etc., and when the wind is in a certain direction, it will carry pollution discharged at one point in comparatively concentrated condition in whichever way the wind is blowing; so that I don't think the fact, if it was a fact, that no ship went very near the intake, would necessarily assure you from pollution in that respect.

Q. But that pollution would be infinitesimal, would it not?

A. No, sir; it would be more than that.

Q. Would it amount to one 100th of one per cent. of the pollution?

GENERAL CROW: Pollution of what?

MR. TODD: I mean, would it amount to one hundredth of one per cent. of the total pollution?

A. I think it would.

Q. How would you treat the waters of Lake Michigan, and as a sanitary engineer, how would you advise that the water should be treated if the only source of contamination should be from the shipping interests of Chicago and you should have a proposition of that kind presented to you?

GENERAL CROW: Complainant objects for the reason,
first, that it is not part of the problem for the witness to
4647 furnish the sanitary district of Chicago an opinion for
the purification of its water supply without employment by the sanitary district in that capacity. Second, it is wholly immaterial for this inquiry as to what method Chicago should pursue for the purpose of purifying its water supply.

MR. TODD: In reply to that, I will state that I am not asking him the question to get his idea as to what Chicago would do, as I am not authorized to secure information for Chicago, but to test his ability as a scientific and sanitary engineer upon problems of that character about which he has qualified in his direct examination.

A. I cannot tell what my solution of that problem would be. I should have to study the problem in detail before I could decide. It may be that no treatment would be necessary if the intake could be placed far enough from the shore to give satisfactory water without treatment; and it may be that it would be cheaper to take water at some convenient place and treat it.

Q. If the sewage of Chicago should be diverted in the manner that it will be when the intercepting sewers are completed, what in your judgment will be the effect upon the typhoid conditions in Chicago?

4648 GENERAL CROW: Complainant objects to that question for the reason that the issue here is not what effect the opening of the drainage canal and the out-fall of the sewers of Chicago into the drainage canal would have upon the water supply of the City of Chicago, but the question is as to what effect that sewage disposal would have upon the waters of the Mississippi river at the intake tower of the St. Louis Waterworks, and, therefore, the question is immaterial.

MR. TODD: Just answer the question.

A. That is as to the effect of the completion of the intercepting sewers on the typhoid death rate?

Q. In Chicago.

A. I think it will reduce it.

A. Will it not reduce the typhoid death rate to the minimum as caused by the water borne by disease of typhoid when the sewage is diverted?

A. I don't know.

Q. Have you any opinion on the subject?

A. Not a decided one.

Q. So the infected sewage of Chicago will be greatly lessened when those conditions obtain, will it not?

A. So far as typhoid infection is concerned it will be.

4649 Q. You have given the subject of the drainage canal and the sewage conditions in Chicago, considerable thought and study, have you not?

A. Considerable, yes, sir.

Q. Where does the Drainage Canal enter the Chicago river?

A. Where does the Chicago river enter the Drainage Canal?

Q. Either.

A. At Lockport.

Q. Where does the Chicago river and the Drainage Canal meet?

A. I don't remember the name of the place.

Q. Do you know how far from the Chicago river—how long the Drainage Canal is?

A. No, sir.

Q. Do you know the width of the Drainage Canal?

A. I don't remember it now, sir.

Q. Do you know its depth?

A. No, sir.

Q. Do you know its capacity?

A. No, sir.

Q. What effect does dilution have upon sewage?

A. It dilutes it.

4650 Q. Is that the only answer that you can give to my question as a sanitary engineer?

A. In what way do you wish to know what effect?

Q. What effect as a scientific engineer does dilution have upon sewers?

A. It has many effects.

Q. What are they?

A. It distributes the sewage matter through a larger volume of water. That is the first and most important effect. The word dilution expresses that.

Q. And what are the other effects besides dilution?

A. If the water which is used for the dilution is aerated it furnishes more oxygen in proportion to the matters requiring oxygen and so changes more or less radically, according to the character of the changes which take place in the oxidation and fermentation of the sewage.

Q. What percentage of sewage to water would be necessary to obtain the conditions that you have mentioned in your last answer?

A. I do not recollect that I specified any conditions which I could define that way. Please read my answer.

(Answer read.)

Q. That is aeration and oxidation?

A. Do you wish to know what percentage of dilution 4651 would be necessary so that oxygen would be always present?

Q. Yes.

A. If that is the question, the ratio which controls is the ratio between the amount of polluting matter and the amount of oxygen in the diluting water, and that depends upon the concentration of the sewage and upon the degree of aeration of the water used to dilute. Both of those ratios are variable and the resulting ratio varies widely in different cases.

Q. Can those ratios be expressed in percentages?

A. In particular cases, not in general.

Q. Take the conditions obtaining in Chicago?

A. And what do you wish?

Q. Take the conditions of the sewage in Chicago with that of the waters in Lake Michigan?

A. I don't see that your question is in shape that I can give you an intelligent answer. If this will help you, I will say that, from my observation of the water flowing out of the Chicago river as I have seen it in the last few years, it has looked to me as if there was dilution sufficient to give an excess of oxygen, and, I do not doubt that that is the case.

Q. Now, you stated that a sufficient amount of oxygen would meet the case; what do you mean by that?

4652 A. Sufficient oxygen to oxidize those matters in the sewage which require oxygen for their destruction?

Q. And what matters in sewage require oxygen for their destruction?

A. The organic matters, the undigested portion of the food in the excrement matters from the urine, and all the matters that go to the makeup of sewage so far as they are oxidizable, but some of them are so stable that they do not readily oxidize and of course don't take up oxygen under those conditions.

Q. When they take up oxygen what chemical compounds result?

A. Carbonic acid and water.

Q. Any other?

A. Yes, the nitrogen in particular goes to the form of nitrates, and there are others, but those are the most important ones.

Q. What quantity of oxygen is necessary to oxidize a given quantity of these organic compounds in water and what time is necessary for complete oxidation to take place?

A. Well, the amount of oxygen depends upon the character of the water that you have to deal with and the time required is very variable. Some of the matters in water are capable of oxidation in twenty-four hours or even less, while others will gradually oxidize for a period of six months or a year, or
longer, I don't know that there is any limit to that. In the
4653 case of peaty matters, the oxidation is so slow that a
month's storage in reservoir hardly produces an appreciable effect, but if you hold it six months or a year you get a very appreciable purification.

Q. What is necessary to aerate water?

A. To get oxygen into it?

Q. How can oxygen be gotten into water?

A. In various ways.

Q. What are they?

A. One way is to throw the water up into the air, let it fall through the air; one way is to pump the air into the water through pipes and let it bubble up through it. The way that is commonest is to let the water absorb oxygen from the air as it always will when the water is not saturated.

Q. In your examination of the sewage conditions of Chicago and the Drainage Canal what did you find to be the ratio between the sewage and the volume of water that entered the Drainage Canal?

A. This is the Drainage Canal and you are not referring to the time prior to the opening of the Drainage Canal?

Q. Since the opening of the Drainage Canal.

A. I have not investigated that; I told you that, sir, from
4654 my observation it was my impression that the oxygen was
in excess.

Q. The analyses which have been made would show that I suppose?

A. Certainly.

Adjourned until two o'clock p. m., same day.

4655 Waldorf-Astoria, New York City, 2 p. m., June 2, 1903.
Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

ALLEN HAZEN resumed the stand for further cross-examination, by Mr. Todd, and testified as follows:

Q. Mr. Hazen, an increased dilution of water to the sewage of Chicago would lessen and mitigate its danger would it not?

A. Not to St. Louis.

Q. Not to St. Louis?

A. No, sir.

Q. Then the amount of dilution of Chicago sewage would have no effect in mitigating the danger to St. Louis, would it?

A. Yes, it would have some effect, not in the direction of mitigating the danger, however.

Q. What is there in sewage that you regard as dangerous?

A. The matters which cause damage which we know most about are the bacteria. I don't know absolutely that there are not other organized forms than bacteria in sewage which may cause damage.

4656 Q. What bacteria do you have specially in mind as being dangerous?

A. The typhoid bacteria are the best known and best studied, but there is every reason to believe that there are other kinds which are also harmful.

Q. Have you ever given the subject of typhoid bacteria any special study?

A. I have given their life history, their relations to water supply and disease study. I have never studied them in the laboratory with a microscope.

Q. What explanation have you for the fact that the typhoid bacillus has never been found in the waters of the Desplaines, the Illinois and the Mississippi rivers?

A. It is a very difficult matter to find them. The amount of water that can be examined effectively for them is extremely small. An infinitesmal proportion of the amount of water flowing and failure to find in the small samples which can be examined is not evidence that it is not present.

Q. And the failure to find is not evidence that it is present, is it?

A. No, sir.

Q. What are the processes by which sewage becomes purified?

A. Well, I should have to prite a book on that subject. I don't think I could cover it then. It is a very long question.

4657 Q. Well, without going into the details, would sedimentation have any effect upon the purification of sewage?

A. It would remove some of the objectionable matters from it and put them upon the bottom of the stream. Considering the question as a whole I should not call that purification.

Q. What would you call it?

A. I should call it sedimentation, the separating of a part of the impurities. From the standpoint of the water alone, it is purification, but considering the whole subject it is not.

Q. Does aeration tend to purify sewage polluted waters?

A. Yes, sir.

Q. In your investigation of the question of the effect of sewage from Chicago on St. Louis, did you ascertain what facilities existed between Chicago and St. Louis for the aeration of the sewage in the waters?

A. No, sir; any more than my general knowledge of the conditions, and I assume as I believe to be the fact that oxygen is in excess throughout.

Q. Do you know how far it is from the Chicago river to the end of the canal?

A. No, sir; I do not.

Q. Do you know by what means the waters of the canal empty into the Desplaines river?

A. It is controlled by a bear-trap dam, of which I have 4658 some figures.

Q. Do you know whether the conditions that obtain at the bear-trap dam are such conditions as would tend to greatly increase the aeration and oxidation of the waters?

A. Why, I should think they might be, I don't know certainly.

Q. You have never seen the conditions that obtain when the waters pass over the bear-trap dam down the declivity into the—

A. I never have.

Q. And you don't know what the effect of that waterfall is upon the waters of the canal, do you?

A. No, sir.

Q. After the waters leave the controlling works at Lockport, do you know how far they flow before they enter the Illinois river?

A. No, sir.

Q. Do you know what the natural conditions are that obtain along the Desplaines river?

A. In what respect?

Q. Do you know whether there are any lakes?

A. No, sir.

Q. If there should appear to be lakes, where the current in the lakes is very slow, would that have any effect upon the purification of the water?

4659 A. Such places would require more time for the passage of the water and so would afford facilities for purification.

Q. That would tend greatly to increase sedimentation, would it not?

A. It would tend to increase sedimentation.

Q. And when the pollution in the water was settled on the bottom of the lakes the amount of sedimentation that did settle would be eliminated from the water as it passed off, would it not?

A. For the time being.

Q. Now, have you ever investigated the conditions that obtain in what is known as Lake Joliet?

A. No, sir.

Q. Do you know whether there is such a thing as scouring that takes place in Lake Joliet?

A. No, sir.

Q. Have you passed Lake Joliet, which is immediately below the city of Joliet—did you follow the course of the Desplaines river as far as LaSalle?

A. On the railroad; not otherwise.

Q. Well, your observation from the train is very limited, is it not?

A. Very limited, yes.

Q. From LaSalle down did you observe the conditions of
4660 the river?

A. I did not.

Q. Do you know how many dams are located in the Illinois river from LaSalle to Grafton?

A. I have seen records of it; I don't know it from personal knowledge.

Q. Do you know what the effect of those dams is upon the waters of the Illinois river?

A. I have some idea.

Q. What is it?

A. To retard its flow somewhat.

Q. How far from the dams is the effect of those dams experienced by the waters of the Illinois river up stream?

A. I could not say, sir.

Q. If it should run up from twenty-five to fifty miles, that would increase sedimentation, would it not?

A. It would when it operated that far, yes, sir.

Q. How long would this sewage have to lie on the bed ot that river in order to be made non-injurious?

A. I do not know, sir. In the Millbury case we were confronted by the proposition, backed up by very eminent experts, that the trouble that our people were experiencing was due to sewage mud which had been deposited prior to a time
4661 some years before, and that was the cause and the sole cause of the trouble.

Q. Do you know from personal knowledge and observation whether or not the conditions obtained along the stream that you have just spoken of here are similar to the conditions that obtain in the Illinois river?

A. To some extent they are similar in that there are a series of dams and places where the flow was slower, and it was in this place where this mud accumulated that remained, and would give rise to trouble after long periods.

Q. Have you any knowledge as to whether the Illinois river is a river that is scoured by freshets or high water?

A. I believe it is.

Q. Upon what do you base your belief?

A. Upon my recollection of the valley; my knowledge of its watershed, and the amount of water which must flow down in time of flood.

Q. What would be the best way to ascertain accurately that fact?

A. Get testimony of residents I presume.

Q. Wouldn't soundings made upon the river before the freshets and after the freshets be the best means of ascertaining that fact?

A. I misunderstood your previous question. I thought your question referred to the freshets.

4662 Q. No, I am speaking of the disturbance of the sedimentation along the bottom of the Illinois river?

A. Well, then my previous answer is not correct, and I would like to have you, if you will, put the question again and I will answer with reference to that.

Q. Would not soundings made upon the river before the freshets and after the freshets be the best means of ascertaining that fact, as affecting the bottom of the rivers where sediment has been deposited?

A. No, sir; I don't think that sounding would be the best way.

Q. Then you believe that the best way and the most accurate way of ascertaining whether the Illinois river is affected by scouring is asking the inhabitants along the river, is that right?

A. I should rather have the judgment of one who understood the subject, who studied the floods.

Q. In what?

A. Who understood the subject, and who watched the flow of the river in floods. I think that would be more conclusive than the judgment of the people who lived along the banks. I thought your first quesion was directed toward the fact of there being such floods and the local evidence should certainly be sufficient to establish that fact.

4663 Q. Supposing that there are floods along the Illinois river, what would be the best means of ascertaining whether the bottom of the river where sedimentation has taken place has been disturbed by these floods?

A. I think that could be told by inspection by an expert. The deposits made in that way would be very light and would often be of such thickness that they would not certainly be shown by soundings, which are at most rough approximations, and I should not rely entirely upon soundings to establish that point. I think it would be possible to see if the current was such that it would stir up and carry away such deposits by inspection.

Q. Have you any opinion as to what amount of deposit has been made in the Illinois river above the dams?

A. No, sir.

Q. Have you any means of ascertaining—is there any means of ascertaining by inspection of the river whether there is a foot or six feet of deposit of sediment on the bottom of that stream above the dams?

A. If there was any such amount as that it could be measured if suitable observations had been instituted for it. I know nothing about whether such observations have been made or not.

Q. What kind of observations do you mean, ocular?

4664 A. If it was to such a great depth as that, it could be best established by sounding.

Q. But, as to whether the deposits are distributed by the freshets, so-called, from the Illinois River, have you any positive knowledge as to whether that is done or not?

A. No, sir, only my knowledge as to what happens generally in rivers.

Q. Do you understand what period of the year the Illinois River flows between its natural banks?

A. No, sir.

Q. Have you any idea how many acres of land in the valley of the Illinois is overflowed throughout the year by the Illinois River?

A. No, sir.

Q. If it should appear that it would be in excess of five hundred thousand acres of land inundated outside of its banks, would that fact suggest to you the possibilities of greater sedimentation and less disturbance by flood than would take place if the river was within its natural channel?

A. The sedimentation undoubtedly would be much greater in that portion of the stream outside its banks where the water was shallow and the current was slower. The scour might or might not be less.

Q. But that you don't know?

4665 A. No, sir.

Q. Did you examine the waters of the Illinois prior to the opening of the Drainage Canal in 1900?—the waters of the Illinois prior to the opening of the Drainage Canal in 1900 above Peoria?

A. Not of the river, I examined some samples from La-Salle from the Canal which I think came from the river some distance above.

Q. Do you know how far Peoria is from La Salle?

A. I don't recollect, no, sir.

Q. Are you acquainted with the size and dimensions of what is known as Lake Peoria, immediately above Peoria?

A. No, sir.

Q. Do you know what the condition of the water immediately above Peoria was prior to the opening of the Drainage Canal?

A. No, sir.

Q. Do you know what its condition is since?

A. No, sir.

Q. Do you know whether the water of the Illinois River above Peoria is less polluted today than it was prior to the opening of the Drainage Canal?

A. No, sir.

Q. What effect does sewage of Peoria have upon the Illinois River?

4666 A. I assume that it pollutes it.

Q. Have you any idea as to the amount of sewage discharged from Peoria into the Illinois River?

A. I have an idea as given by the Census Report of the size of Peoria.

Q. Do you know what factories and industries are located at Peoria?

A. I understand that the distilling business is conducted there and that large numbers of cattle or hogs are fed there, and that a great deal of the refuse is put into the river.

Q. Do you know how many distilleries are located at Peoria?

A. No, sir.

Q. Do you know of any other factories?

A. No, sir.

Q. Are you acquainted with what is known as the Glucose Sugar Refinery factory which is located there, whose refuse goes into the Illinois River?

A. No, sir.

Q. Have you any idea of the number of cattle that are fed along the banks of the Illinois River by the distilleries?

A. No, sir.

Q. Do you know what the ratio of Chicago sewage bears to the sewage of Peoria, immediately below Peoria at Pekin in the waters of the Illinois River?

4667 A. The proportion of Chicago sewage, do you mean the whole of the sewage or that part which is left?

Q. The proportion of the sewage that reaches Peoria from Chicago, the ratio of the sewage that enters the Illinois River at Peoria?

A. Why, I should say that the ratio of the sewage was in proportion to the respective populations.

Q. Have you any knowledge as to how much of the sewage of Chicago has been eliminated from the waters of the Illinois by the time it gets to Peoria?

A. No, sir.

Q. Then, in the absence of that knowledge, would the proposition that you have enunciated that the ratio depends upon the relative population of those two cities still stand?

A. The proportion of sewage, I think it would, sir; if you mean to distinguish between sewage and some constituent part of sewage, it would not, but if you refer to the amount of sewage in the water, I think it does.

Q. Would the amount of sewage at Peoria be as great in the Illinois River as the amount of sewage that passes over the bear-trap dam?

A. No, sir.

Q. Have you any idea as to what percentage of the sewage of Chicago has been eliminated from the waters of the 4668 Illinois River by the time it gets to Peoria?

A. I don't think that any part of the sewage has been eliminated, but some of the constituents of the sewage have been eliminated.

Q. What is the difference between sewage and its constituent parts?

A. Sewage is composed of its constituent parts.

Q. Then, if you eliminate some of its constituent parts, you eliminate some of the sewage, do you not?

A. You change it.

Q. But you eliminate it, do you not?

A. No, sir, I shouldn't say so; you change it then; you modify it.

Q. When it becomes modified, does it still retain its characteristic of sewage?

A. Not necessarily always, no sir.

Q. That which has not become oxidized and destroyed still remains as sewage, does it not?

A. No sir, not necessarily. To my mind it is a question of dilution. When it is concentrated it is sewage; when it is diluted beyond a certain point it is polluted water. There is not a sharp line, it is an entirely arbitrary division.

Q. Would the pollution—employ that term—of the waters at the bear-trap dam be as great as the waters of the Illinois?

4669 A. I don't know, sir.

Q. The pollution at Peoria would be less would it not, than the pollution at the Bear Trap Dam?

A. I don't know, sir.

Q. You don't know?

A. The pollution—I do not if I understand your question correctly, sir.

Q. I am employing the word "pollution" with the significance attached to it that you described in one of your previous answers.

A. Yes.

Q. Now the question is, is the water that passes over the Bear trap dam more polluted than the water is by the time it reaches Peoria?

A. I presume it is.

Q. Is it less polluted at Peoria than it is at the Bear Trap dam?

A. I presume it is.

Q. If it is less polluted, to what do you attribute the lessening of the pollution of the waters of the Illinois at Peoria?

A. In the first place to dilution. In the second place, at times to sedimentation. In the third place to the destruction of a number of the organic matters by oxidation in the
4670 water, and in the fourth place to the death of a portion of the bacteria.

Q. Do you know whether the water of the Illinois River, before it takes on the sewage of Peoria, is more polluted than the water of the Illinois river is after it has taken on the pollution of Peoria?

A. Do I know if the water above Peoria is more polluted?

Q. Yes, than the water below Peoria?

A. No sir; I should suppose it would be the other way.

Q. That is, it would be more polluted below Peoria than it would be above Peoria?

A. I should certainly think so.

Q. Do you know whether the amount of polluting material in the water above Peoria is as great as the amount of polluting material that is added to the water by the sewage discharged at Peoria?

A. Do you refer to the organic matters in gross, or to the germs which are likely to cause disease, because there is a very important distinction there. These wastes from Peoria probably contain enormous quantities of organic matter which make a perfectly tremendous show upon your chemical analyses, but which from a sanitary standpoint are of no significance whatever.

Q. Well, we will take it from the organic matter first.

4671 A. Then sir, I don't know as to the ratios of those substances that you mention.

Q. Then we will take it as to its infected matter.

A. I should suppose that the amount of infected matter brought from Chicago would be very largely in excess of the amount added by Peoria.

Q. Is that opinion based upon any accurate knowledge, either chemically or bacteriologically?

A. It is based upon my experience with streams in general, under the conditions as I understand and assume them to be.

Q. Is it based upon any personal knowledge in regard to the conditions that obtain at Peoria itself?

A. No, sir.

Q. It is an assumption then, based upon experience in other matters and in other cases?

A. Yes sir.

Q. Do you know what the conditions of the waters of the Illinois River is at Grafton?

A. When?

Q. Since the opening of the drainage canal?

A. It is very variable.

Q. As to whether it is infected with infectious matter or polluted with organic matter?

A. I regard it as quite certain that it is certainly, 4672 beyond a reasonable doubt.

Q. How do you prove that proposition?

A. I don't prove it.

Q. It is a proposition that it is not necessary to prove. You admit it. Is that the way you come to it?

A. No sir, I would like to prove it if I could. The proof would necessarily be somewhat indirect and circumstantial.

Q. It is susceptible of demonstration?

A. I think it may be.

Q. Has it ever been?

A. Perhaps not absolutely demonstrated. The increased death rate in St. Louis since the opening of the canal is a very strong indication of it.

Q. But eliminating St. Louis for the time being, is it susceptible of demonstration at Grafton?

A. Well, sir, I don't know about the certainty,—about the possibilities of that.

Q. Well, do you know whether or not the waters of the Illinois River at Grafton has been proven to be infectious and polluted?

A. I believe it has.

Q. In order to prove it infectious what is necessary to be established?

A. The best available proof is the increased death rate 4673 among those who use it.

Q. Do you know of anyone who uses the waters of the Illinois River at Grafton, or immediately above Grafton?

A. No.

Q. If it should appear to you that a great number of people fishing on the Illinois river, living in flat boats along the Illinois River,—a floating population of several thousand, was using this water for drinking purposes, and that typhoid fever was a thing almost unknown among those people, would that have any effect in your judgment?

A. It would be an interesting consideration and I should consider it.

Q. If you saw these people drinking and knew that these people drank that water and you knew that these people did not have typhoid fever as a consequence of drinking that water, would you not draw the conclusion from that fact that the water was not infected?

A. If there were a sufficient number of people; if the evidence was clear and conclusive on the point that they drank the water and that they drank it straight, and that they did not have typhoid fever, it would be a very important piece of evidence.

Q. Suppose that the evidence should show that the cities 4674 along the Illinois River, where great numbers of people were engaged in the fishing industry and that these people should contend that the water of the Illinois River was better water today than it was prior to the opening of the drainage canal; that they drank the water and experienced no deleterious effects from it, would not that be strong evidence to your mind as a sanitary engineer that that was not infected water?

A. It would not. That is an entirely different proposition from the one which you put to me. The men who use the water as you say, would measure the character of the water by its appearance and the addition of the clear, colorless lake Michigan water unquestionably improves the appearance of that water very much. The fact that a number of people would testify that they drank it and did not have typhoid fever would be valueless in the absence of the complete record about which you spoke, because even with the most polluted waters, the large majority of the people drinking such water escape, while only a small minority contract the disease and suffer. A majority of people will take the germs and dispose of them and be no worse for it.

Q. Then the fact that a large number of people living in flat-boats along the Illinois River drinking the water; a great number of people going out and fishing upon the rivers
4675 and drinking the waters for weeks at a time, and that
the typhoid conditions decreased instead of increased among that class of people since the opening of the drainage canal, would be no evidence then, to you as to whether the water was infected or non-infected?

A. To make the evidence of value it is necessary to have a definite population and to get the statistics of sickness and death for that population. To show that a large number of people used the water and did not suffer from it is utterly inadequate.

Q. There are other causes that may give typhoid fever except the drinking water, are there not?

A. Yes sir.

Q. Now if it should appear that these other causes, such as oysters, celery and matters of that kind, and people traveling, were not present, would not the absence of any other cause be a strong evidence or circumstance that this water was not infected?

A. I don't see how the absence of the other circumstances would make the case clearer.

Q. Then, assuming that you eliminate St. Louis and disregard the evidence of the people who use the water along this river, how can you determine whether or not the water of the Illinois at Grafton is an infected or non-infected water?
4676 GENERAL CROW: Complainant objects to the question for the reason that it states a proposition that is absolutely impossible for this witness to base an opinion on, for the reason that a man must have some information about a subject before he can offer an opinion.

Q. MR. TODD: Answer the question.

A. If we eliminated the evidence in this particular case, there might be no proof. We could still form an opinion and back it up on very good grounds, that the water would be injurious, because of the large proportion of sewage which it contains, and the fact that the time required for the sewage to reach that point is insufficient to allow complete destruction of the deleterious matters contained in it.

Q. But as far as any scientific chemical or bacteriological examination of the waters at Grafton is concerned, have you any definite knowledge or personal knowledge as to its condition at that point?

A. The chemical analyses can never show infection of a water; they can only show pollution and infection can be sometimes inferred from the pollution. The bacterial examinations may possibly show the presence of infectious material. As a matter of fact the difficulty of finding it, even when it is known to be present, is so great that it is very seldom found
4677 even where there is the best reason to believe that it is present and present in serious amounts.

Q. Then the way you ascertain a conclusion that a water is infected is by its use and effect upon the inhabitants of the people who use it?

A. If that evidence is available it is about the best usually. If it is not available, we have to resort to indirect methods, methods which have been established by experience in other cases, and which when reasonably applied are reliable.

Q. How long does it take the sewage of Chicago to go to the intake at St. Louis at an average flow of water?

A. Somewhere in the neighborhood of two weeks?

Q. How do you ascertain that fact?

A. I have been told that by people who have studied the matter.

Q. You have no personal knowledge on the subject?

A. No sir.

Q. You don't know whether that is correct or not, except as you have faith in the person who told you?

A. That's all.

Q. Do you know how long it takes the water from Kansas City to get to the intake tower at the chain of rocks?

A. It would depend upon the water stage.

Q. Do you know how far it is from Kansas City?

4678 A. I don't recollect it now.

Q. It is about 400 miles, and the time as has been testified to is in the neighborhood of four or five days?

A. That seems reasonable.

Q. If you should have in Kansas City, 490 cases of typhoid fever there in a year, within four days journey of St. Louis, could you tell whether the death rate in St. Louis was attributable to the pollution from Chicago, which takes at normal times, two weeks, or whether it came from the pollution of Kansas City?

A. I think they would both be contributors.

Q. Could you determine which one would be the more generous contributor?

A. In point of time Kansas City would be nearer; in point of population Chicago would be much greater. I should think probably the extra population of Chicago would more than off-set the extra time, but that is a matter which from the nature of the case could not be determined with precision.

Q. The nearer the water supply is to the source of contagion, the greater the danger is it not?

A. When measured in time, yes sir.

Q. If it should appear that along the watershed of the Illinois, the Mississippi and Missouri Rivers, for the year 1900, there should be in the neighborhood of 3500 cases of typhoid fever and in the city of Chicago there should be in the neighborhood of 3300 cases of typhoid fever, figuring the deaths and the cases at the ratio of one to ten; ten cases for every one death, to what would you attribute the increase of typhoid fever in the city of St. Louis,—to Chicago or to the other town? 4679

A. That is the increase?

Q. The increase?

A. I should attribute it to Chicago, because Chicago is a new element in the situation in the year which you mention.

Q. That being the case, if it should appear that in Kansas City, the increase for the year 1900 and 1901 was a gradual increase, and if it should appear that in Quincy, Illinois, they had a similar general increase, and in the city of Minneapolis there should be an increase from 13 in 1900 to 121 in 1902, deaths, what theory could you give as accounting for the increase in other places not being affected by the city of Chicago?

A. It would be impossible for me to explain such matters off-hand without knowing about the conditions present. If it should be shown that there was a general increase in typhoid over the Mississippi valley co-incident with the increase in St. Louis, it would tend to show that the pollution from the cities up the valley contributed more to the increase in St.
4680 Louis, and the addition of the Chicago sewage less, than I should suppose under opposite conditions.

Q. Have you given the question of the increase of typhoid fever for the years 1900 and 1901 in other cities outside of St. Louis, any consideration?

A. No sir.

Q. Do you know what effect the Spanish-American War had upon the increase of typhoid fever in this country, the soldiers returning from the typhoid laden camps throughout the south and Cuba?

A. I understood that in some parts of the country cases were brought home in that way. That has not come under my observation anywhere, however.

Q. Do you know what position St. Louis occupied during those years, the three years I have mentioned, as to being a central point for returning soldiers from these wars, to separate and go to their homes?

A. No sir.

Q. If it should appear that a great number of soldiers from these infected camps passed through the city of St. Louis during these years, would not that account in a large measure for the increase of typhoid fever there, as well as in other places similarly affected?

4681 A. If a large part of the cases and deaths were among such returned soldiers, it certainly would; otherwise I don't see that that would be an element in the case.

Q. Would you regard an increase of thirty deaths in a city of the size of St. Louis, as something enormous, or of the nature of an epidemic?

A. Let's see; thirty deaths; that represents 500,000–people.

GENERAL CROW: You mean in a year?

MR. TODD: For a year I mean?

A. That is a substantial increase.

Q. If the total deaths in St. Louis was 168, would you call that a condition of epidemic—for a year?

A. I would leave that to the doctors.

Q. That fact has no significance then to you, as a sanitary engineer?

A. Yes sir, the fact of the increase has significance, but whether it is called an epidemic or not is something which I should not attempt to say. Very different rules are followed about that. If that happened in Germany it would be called an epidemic without question, but in my American practice I doubt if it would be commonly so called.

Q. What do you regard as the most important fact, the number of people who die from typhoid fever, or the number of people who have the cases?

4682 A. If you can find out the number of people that have the cases accurately I think that is best, but under American conditions that number can very seldom be determined accurately or even approximately, and under our condition of registration the record of deaths is much more reliable.

Q. If it should appear that in the city of St. Louis in 1900, 1901 and 1902, the death rate was a gradual increase, and the number of cases was a gradual decrease, what conclusion would you form from that condition?

A. I should think there was a new kind of germs of more active kind, that were getting into the water.

Q. If the evidence sworn to in this case should show that in 1900 there were 168 deaths, and 1213 cases, and in 1901, 198 deaths and 1101 cases, and in 1902, 222 deaths and 1112 cases, would you state from that data that typhoid fever in St. Louis was on the increase for those years, or on the decrease, assuming that the man who swore to these figures was connected with the Health Department of the City of St. Louis?

A. From my knowledge generally of the way such records are kept, I should give the record of deaths much greater weight

than the record of cases, because while the deaths are not always reported, the percentage of deaths not reported is comparatively small, while reporting cases, even under the most stringent laws in this country is very irregular, a large
4683 part of the cases never are reported.

Q. Do you know in what proportion of deaths reported as typhoid fever that there was a regular diagnostication of the cases by the doctor?

A. I have no idea.

Q. It is not an easy matter for an ordinary practitioner to diagnosticate a case of typhoid fever is it Mr. Hazen?

A. I understand there is doubt sometimes.

Q. Then is the question of death any more accurate as to the causes of death than the number of typhoid cases reported as being typhoids?

A. Yes, I think it is. It does not turn on the diagnosis by the doctor; it turns on the fact of the completeness of the returns. A man has a mild case of typhoid fever and his doctor doesn't report it; the health board never hears of it at all. If he dies they are more apt to hear of it.

Q. But assuming that in the city of St. Louis for these three years, particular effort was made by the health department in sending out letters to all the practicing physicians to report the cases of typhoid fever and the deaths, and these tables that I have given were the results obtained, accepting these results as true, would you say that the deaths indicated an increase or the number of cases indicated a decrease?

A. I could not accept that record as true.

4684 GENERAL HAMLIN: He says to accept it.

A. Because the ratio of cases to deaths is such that it would indicate a clumsiness on the part of the St. Louis doctors, if it is true; I could not believe so; it is outside of the range of conditions that I can assnue.

Q. But assuming that the St. Louis doctors as a class are as good as the doctors in any other cities in regard to diagnosing deaths as well as diagnosing cases that do not die, and assuming that these facts are true as testified to, would you as a sanitary engineer say that the deaths illustrated an increase in typhoid fever, or that the cases demonstrated a decrease in typhoid fever?

A. I don't think that either statement would be correct without qualifying it by notice of the other.

Q. Mr. Hazen why do you want to qualify the question when the assumption is assumed to be true?

A. Because if the deaths increased and the cases decreased in a city, and the record was absolutely correct, it would not be wholly true to say either that the disease was on the increase or the decrease, because, measured by different standards, each assumed in this case to be correct, the results are different.

Q. You recognize the fact that different doctors of different degree of talent have greater or less success in the treatment of typhoid cases, do you not? 4685

A. I presume so.

Q. Some doctors, by virture of their experience and skill lose very few of the cases of typhoid which they treat. You recognize that fact, do you not?

A. I presume that there is a difference in skill, yes sir.

Q. And there are other doctors that kill nearly every one they treat, depending upon their skill or lack of skill?

A. Yes, or lack of skill.

Q. But the question of how a case terminates, has nothing to do with the case itself, has it?

A. I think that it has, because I think it has to do with the severity of the attack, because sometimes the cases are all mild and sometimes they are all severe, and I think that if the cases become more severe without increasing in numbers, so that a larger proportion of them are fatal, that that may fairly be called an increase in the typhoid conditions.

Q. A mild case of typhoid fever will infect a water supply as greatly as a severe case, will it not?

A. I don't know about that. I don't think the data show.

Q. That has been testified here by people who have assumed to know?

A. I wouldn't dispute it, but I don't know it.

4686 Q. Now, assuming Mr. Hazen, that in the city of St. Louis, the true situation was in 1900 that out of the total number of typhoid fever cases,—there were 1213— 168 people died; in 1901 there were 1101 cases, and 198 people died. For those two years would you say that typhoid fever in the city of St. Louis was on the increase or on the decrease?

A. I should say it was on the increase.

Q. In other words, the more people that die and the less number of cases, would be indicative of an increase in typhoid fever, and if few people died, and more cases prevailed, it would be on the decrease?

A. That would in general be my conclusion, but I think a full accurate statement of that would include data upon both points.

Q. Do you reason that way Mr. Hazen, upon any other line of thought or business in which you have any connection?

A. Reason in what way?

Q. The same kind of reasoning that you apply in answer to my last question, about the increase and decrease of typhoid fever?

A. I endeavor to use my best reasoning power on all the problems that I consider.

Q. Before the opening of the drainage canal did you consider the waters at St. Louis as dangerous for drinking purposes?

4687 A. I did not consider it at that time, but I should so consider it.

Q. You would consider it?

A. Yes.

Q. If a water is a dangerous drinking water, how can that water be seriously injured by the addition of more pollution?

A. I endeavored to explain that to you this morning, by stating that there were different degrees of infection; that they range from nothing up to a certain figure, which represents not the worst water that could exist, but the worst water that is practically met under American conditions, and if a water was of such a character as to cause one death unnecessarily, I should regard it as dangerous or bad water, but if it became more polluted it might cause two deaths or five deaths in place of one, and so it would become worse.

Q. In the construction of filters is there any additional cost for a filter for the filtering of bacteria?

A. There may be.

Q. Aside from the filtering of mud?

A. There often is additional expense. In the case of St. Louis there would not be materially.

Q. As the water of Chicago becomes less contaminated
with sewage from the city, by diverting the sewage into
4688 the Desplaines river, and the public health of the city
becomes improved, the infectious material entering into
that river will gradually become diminished, will it not?

A. I expect it will.

Q. And in proportion to its diminishing, in just such a proportion does the danger of that water in the Illinois River decrease to those using it?

A. So far as typhoid fever is concerned, that proposition is to a large extent reasonable, but as I said this morning, from the best data that I can get, where there is one death from typhoid fever, there are several deaths from other diseases shown by the general death rate which come from the preponderance of the diseases there. I would put it in this way: when a city has a bad water supply and does away with it, and gets a good one, the general death rate falls. That has happened repeatedly; has happened so closely to the time that the new water supply has been introduced that there can be no reasonable doubt that that is a fact. Our information in regard to typhoid fever and the germs of it, is more specific than in regard to these other things. Whether they react in the same way or not I don't know, so that the proposition that you raise, it seems to me is speculative and beyond the range of what can be settled by the existing data.

4689 Q. This whole subject is speculative, is it not?

A. To some extent, yes sir.

Q. The question of the effect of Chicago sewage upon St. Louis is speculative, is it not?

A. To some extent.

Q. Now in the mixing of the waters of the Mississippi and Illinois, Mr. Hazen, how did you ascertain that fact?

A. I saw it.

Q. Is that a thing that is susceptible of demonstration by the naked eye?

A. Yes sir.

Q. Where did the mixing first begin?

A. At the mouth of the Illinois river.

Q. When the mixing begins at the mouth of the Illinois river, by the time it gets to the mouth of the Missouri river, is that mixing complete?

A. I don't think it is absolutely complete. It is approximately so; more so at low water than at high water.

Q. Is the water on the Missouri shore of the Mississippi river—in the Mississippi river for several hundred feet from the shore, and when beyond that point becomes slightly mixed with Illinois River water, and the Illinois River water preserving its identity on the Illinois shore?

A. No sir. I investigated that point much more at
4690 length with reference to the mixing of the Missouri and
Mississippi river waters. I can give you figures on that if you like.

Q. The Missouri River water entering the Mississippi, does that commingle and mix before it reaches the St. Louis intake?

A. It does.

Q. What proportion of the Mississippi River water that mixes with the Missouri River water, is Illinois river water?

A. I cannot give you that proportion; it is variable with the flows.

Q. Is it susceptible of demonstration?

A. Yes sir.

Q. That in a gallon of the water at the intake, what part of that gallon is Missouri River water what part is Mississippi River and what part is Illinois river water?

A. Yes, it can be substantially demonstrated; not precisely.

Q. In what way, Mr. Hazen?

A. The best way is by a consideration of the constituents of the different waters. I made those computations for the Missouri and Mississippi, not attempting to separate the Mississippi and the Illinois, and we find this condition: The water
of the Missouri carries a great deal more suspended mat-
4691 ter than the water of the Mississippi. It also carries a
great deal more chlorine. Taking analyses at the same

times of waters of the Missouri a little distance up and of the Mississippi a little distance up and analyses of the water taken at the same time from the chain of rocks, it is possible to compute with considerable accuracy the proportions of the Missouri and Mississippi river waters in the intake at that time. The determinations of chlorines and suspended matter proved to be the most useful for making that computation in this particular case, but other constituents of the water could be taken for the determination and perhaps in the case of the Illinois river it would be better to use something else.

Q. What proportion of Missouri River water and Mississippi water enters the intake?

A. About thirty per cent Mississippi River water, and 70 per cent Missouri river.

Q. Of that thirty per cent, how much of that 30 per cent would you call Illinois River water?

A. That I could not say.

Q. Do you think it would be an average of five per cent?

A. I could not tell.

Q. Do you think it averaged anything?

A. Yes, it does.

4692 Q. How do you know it?

A. Because it mixes with the Mississippi and the Mississippi mixes with the Missouri.

Q. Does it completely mix on the west side of the Mississippi?

A. Oh yes.

Q. Did you follow that fact down?

A. I didn't follow it down because I regarded it so obvious that it was unnecessary to follow it up.

Q. You assumed that is the fact, did you?

A. Yes sir.

Q. You didn't demonstrate it?

A. I can see it.

Q. And you regard ocular evidence as all sufficient for that purpose?

A. I do.

Q. And of this thirty per cent, would you believe that five per cent of the water was Illinois River water?

A. That could be computed, but I have not made the computation, and I would not attempt to venture a guess.

Q. Do you know how much of the year that percentage obtains of the Mississippi river water entering the intake?

A. The annual average as nearly as I could get at it,—
I expect that the Mississippi river water runs up to seventy
4693 or eighty per cent in the early spring, and down to
ten or fifteen per cent in the July rise in the Missouri.
It probably varies from year to year—constantly varies.

Q. You are acquainted with the way the St. Louis intake is situated, are you not?

A. Yes sir.

Q. What effect does the dike between the intake and the shore have upon throwing the water of the Missouri river out towards the Intake?

A. Oh, I don't know that it has a very material effect. I presume it has more effect at low water than at higher stages.

Q. At the higher stages of water wouldn't that have the effect of throwing the water towards the intake, striking against it?

A. I shouldn't think nearly as much effect in high stages, as at low stages.

Q. Well, would there be any time that it didn't have any effect, more or less?

A. Oh, perhaps not; I don't know about that.

CROSS-EXAMINATION, by Judge Springer.

Q. You stated that you had given an opinion as to the proper treatment of the water supply of the city of Washington?

A. Yes sir.

4694 Q. What did you find to be the condition of the water supply of that city so far as application to the water supply of Washington from a sanitary standpoint is concerned?

A. I don't think I quite get your idea.

Q. What did you find to be the condition of the water in the Potomac River with reference to its use as a water supply for the city of Washington?

A. Why, it is a somewhat polluted water, and objectionable.

Q. Was it so far polluted that you gave it as your opinion that the path of safety lay through filtration?

A. Yes sir.

Q. What kind of a system did you recommend?

A. We recommended a combined system consisting in the first place of the treatment of the water with a small amount of coagulent at times of flood only; that part of the treatment was to be omitted whenever the turbidity of the raw water was such as not to require it. The water was then to be settled, and after settling was to be filtered through sand filters. I think that is substantially correct.

Q. Is that the system which is being carried out now?

A. It has been adopted as to the filters. The provision for applying the coagulent has never been officially adopted.

4695 Q. What is your general method for treating the waters of our American rivers before being introduced into a city or town as a water supply?

A. Well, there are different treatments that are used for different waters. There is a great deal of variation in that respect.

Q. Is there a general idea that runs through the whole?

A. Yes sir.

Q. What is that general idea?

A. To take out the deleterious substances; but those substances are so different in different cases, different in kind and different in amount, that the means adopted for removing them are quite varied.

Q. Where those deleterious properties are the result of ordinary sewage pollution from the sewage of cities and towns in the river districts, what is your system?

A. And that only?

Q. Yes?

A. To filter the water through sand as is done in Europe, where the conditions are favorable for that. We are limited somewhat by the local conditions that we can get.

Q. What did you find were the general conditions so far as water supply at St. Louis was concerned, at the time you made the examination in 1901?

4696 A. The St. Louis water is extremely turbid in addition to its sewage pollution, and in addition to the yellow color which it gets from the upper Mississippi. That yellow generally is not a serious factor at St. Louis, but it occasionally is when the upper Mississippi is in flood and the Missouri is low.

Q. What importance do you attach to that pollution in our rivers which comes from flood tides and the washing of the rural districts as distinguished from the sewage from cities?

A. That is an element in the problem, but the most dangerous pollution is that from the cities.

Q. Is not the pollution that comes from the annual rise of the rivers where rural districts are washed out and farms and breeding lands and the small villages are washed out, a very important question in polluting the streams in this country?

A. It is an important element. There are saving features, if it comes at a time when the flood is greatest; if that amount of pollution was put into the river at a low water flow it would be most disastrous.

Q. The large amount of dilution then which accompanies this flood tide period tends to remove a portion of the danger?

A. Yes, sir.

Q. From pollution?

A. Yes, sir.

4697 Q. But do you not take into consideration in prescribing a means of treating the waters for a city or town, both these elements of pollution, the flood tide element, and also the continuous pollution from the sewers of cities?

A. A water purification plant has to be designed to meet all the conditions that can be reasonably anticipated.

Q. Now, when you passed upon the question of a water supply for St. Louis, what elements did you take into consideration in regard to the condition of the water at the chain of rocks?

A. I considered particularly the removal of the three matters which I mentioned, the mud, which comes largely from the Missouri, the color which comes largely from the upper Mississippi, and the sewage pollution which comes from all of them.

Q. Well, didn't this system which you recommended, contemplate the meeting of all of these conditions and overcoming them?

A. As far as possible, yes, sir.

Q. What was that system?

A. It was a system of settling the water first, to remove the grosser matters; then coagulate it; then settle it again and then taking it to mechanical filters and then to clear water reservoirs; then to the pumping stations in the city. 4698

Q. What did you estimate then would be the condition of the water after passing through this process and entering the city supply?

A. I considered that it would be a satisfactory supply.

Q. Is it your opinion that the waters of our navigable rivers generally require similar treatment for the purpose of making them suitable for domestic uses?

GENERAL CROW: Complainant objects to that question because the experience in general of the witness is not at issue in this case.

A. With some modifications that is generally true. The details of the treatment recommended would be very different for different kinds of water.

Q. Isn't it true that in all cases where you have been consulted in regard to water supplies of cities, that you have recommended some kind of artificial treatment before the use of the water from our streams?

A. So far as the large rivers are concerned, that is true, but it is not true with reference to smaller streams and lakes.

Q. I confined my question to the rivers. It would not be true of course where there is no pollution. When you took into consideraton the various conditions at St. Louis to be overcome, did you take into consideration the fact that the supply of water at the intake came from the three rivers, the Missouri, the Mississippi and Illinois rivers? 4699

A. I did.

Q. Were you aware of the fact at that time that the drainage canal had been opened and the sewage of Chicago was emptied into the Desplaines river?

A. Yes, sir.

Q. You took that into consideration?

A. Yes, sir.

Q. Having that fact in your mind, and the large amount of matter in suspension in the Missouri river, and the turbidity of the upper Mississippi, you reached the conclusion that a wholesome, safe water supply could be obtained for that city by the use of the system which you have described?

A. Yes, sir.

Q. What did you say the cost of that would be according to your judgment?

A. The cost of construction, including the auxiliaries was something under $3,000,000. I have not got the exact figures. Of course the operating cost would be in addition to that.

Q. Would the cost be reduced somewhat if you could eliminate the water that comes into the Desplaines river from the drainage canal?

4700 A. Not materially.

Q. Assuming that the dilution produced by waters from Lake Michigan, caused the waters of the Illinois river to appear to be freer from matter in suspension, in other words, clearer, would that element add anything to the use of the stream for farm purposes and the culture of fish and the supply of those uses and domestic purposes other than drinking water?

GENERAL CROW: Complainant objects to that for the reason that the question as to whether or not farms on the Illinois river might be benefited by the flow of the lake water into the Illinois river, is not at issue in this case, and the further objection that the witness is not competent to pass upon that question; nor has he any knowledge as to fish culture or agriculture.

JUDGE SPRINGER: I was simply asking his opinion of the water for domestic uses.

Q. (Question read.)

A. That is a question that I have not considered at all. I don't know that I could answer it off-hand.

Q. What was it that suggested to your eye at the St. Louis intake, that Illinois river water was present?

4701 A. There is an intermediate step in the reasoning. I could see the twist in the current where the Illinois river came into the Mississippi, which showed me that the Illinois and Mississippi waters became mixed before they got down to the mouth of the Missouri.

Q. What was it?

A. And the proportions which I gave were the mixture of the Missouri with the mixture of the Mississippi and Illinois river waters, as it was above, taking the samples opposite Alton.

Q. What was the peculiarity that caused you to discover the presence of the Illinois river water?

A. At Alton, say?

Q. At any place.

A. There is no peculiarity of the water. It could not be followed as the mud of the Missouri could be followed. It was simply that I could see the current twisting in such a way that it involved a mixing of the water, as I know by experience with water myself.

Q. Could you discover any difference in the color of the water of the Illinois river there as compared with the Mississippi and Missouri?

A. Where they come together the Illinois river water has a low color and the Mississippi water is yellow, and at the time of your inquiry I had overlooked that fact. For a little way be-
low you could see nearly colorless water on the Illinois
4702 side, but it only went down a short distance and went
across, so that no difference was perceptible.

Q. Where it came in from the Mississippi river it was much lighter in color?

A. Not so much difference in clearness, but the Illinois was nearly white and the Mississippi was quite yellow.

Q. What was the cause of that difference in color?

A. The peaty matter in the Mississippi river water.

Q. And the freedom from turbidity in the Illinois river?

A. The turbidity was about the same as I remember it.

Q. The turbidity as relates to color?

A. The turbidity and color are separate. All water can be either colored or turbid, the two things are entirely distinct and anyone using one term does not imply the other.

Q. I thought turbidity related to coloring matter in the water and not to matter in suspension.

A. Turbidity relates to matter in suspension, coloring matter to matter in solution.

Q. The coloring matter given by mud, for instance, is not
turbidity, and turbidity, according to Professor Sedg-
4703 wick's definition, was that coloring matter that came from
cattle, glucose, as already defined, for instance—

A. I didn't hear Professor Sedgwick's testimony, but knowing him very well, I should confidently expect that he would testify to the very reverse of that.

Q. But still you could see the difference?

A. Yes, sir.

Q. And that difference was more pleasing to the eye than the coloring matter that you saw coming from the other?

A. It was; it was a nicer looking water.

Q. Then so far as farming purposes along the line of the river below St. Louis are concerned, this Illinois river water would not materially deteriorate the conditions?

A. I should think that, as it tended to increase the pollution of the river, it would tend to be objectionable. I presume that it would not be large in its influence below St. Louis.

Q. Especially for watering stock and cattle?

A. I presume so. I have not studied the transmission of diseases of cattle and pigs. I have understood that they were carried by water, and that they were factors in such cases, but I have not studied that and do not attempt to testify as to it.

4704 RE-DIRECT EXAMINATION, by General Crow.

Q. Mr. Hazen, counsel on the other side was asking you as to the effect of dilution and infection in sewage in water; I will ask you if any amount of dilution alone will remove typhoid bacilli from water?

A. It will not remove it; it may reduce it in amount to so small a quantity that for practical purposes we would be willing to overlook it.

Q. Well, does it reduce the amount of bacilli?

A. No, sir; not in the absolute; it simply reduces the proportion.

Q. It minimizes the danger of receiving it?

A. Yes, sir.

Q. Mr. Hazen, the question was asked you if a good deal of your work had not been with reference to putting in filter plants. I will ask you if you have not been engaged in purely chemical work also, with reference to water supplies at various times?

A. That was at Lawrence, before I went to Chicago.

Q. Well, it was during your professional career?

A. Yes, sir.

Q. What was the character of that employment there,
4705 and what was your title?

A. My title was Chemist in charge of the station.

Q. Now, what was that station called?

A. The Lawrence Experiment Station.

Q. Experiment on what?

A. I described that this morning. It was on the purification of the sewage and water and at first I did considerable chemical work, but afterwards there were other questions coming into the scope and I had charge of all of it, and another man was assigned to help me on the chemical work and I didn't follow that as much personally.

Q. Well, for five years you did have charge of very important chemical work at that station in the state of Massachusetts?

A. Yes, sir.

Q. And at Chicago did you ever have charge of chemical work?

A. Yes, sir; I had charge of chemical work frequently, but the difference is, I always got someone else to do it for me. I have not attended to it personally.

Q. Well, you were the chemist at the Exposition in Chicago?

A. In that department, yes, sir.

Q. Water supply?

A. Yes, sir.

4706 Q. Now, I will ask you if you have been in your professional career, if you have been consulted, and have you not advised at different places, towns and cities, as to the mere disposal of sewage without reference to the supply of water?

A. I have, yes, sir.

Q. Where and when?

A. Altoona, Pa., works for the purification of a part of the city sewage were built under my general direction and I advised them with reference to sewage for other parts of the city, and Vassar College, the firm of Noyes and Hazen, of which I was a member, designed and built the sewage disposal plant.

I was also employed by Plainfield, N. J., and by Spencer, Mass., in relation to the construction of purification works.

Q. Sewage purification works?

A. Yes, sir; and I have advised in regard to some other cases. There was one at Waterville, Me., and one at Gloversville.

Q. Are you generally familiar with the methods of sewage disposal, aside from water supply, that was practiced on the continent of Europe ten years ago and up to this time and in England?

A. I was quite familiar with them back in 1894. I have spent a great deal of time investigating the most important plants since that time, a great deal has happened in sewage disposal which I have not followed in detail. 4707

Q. Now, does aeration destroy typhoid germs?

A. No, sir.

Q. I will get you to state whether or not you were familiar with, at the time of the investigation in 1901 of the St. Louis water supply and your report thereon, the chemical and bacteriological data that was under the control of and accessible to the city authorities of that city at that time?

A. I was familiar with that data.

Q. Did you examine it?

A. Yes, sir.

Q. Who had compiled that data?

A. Mr. Teichmann, the city chemist, had compiled his observations and Dr. Ravold also had made some compilations and in addition to that there were some records of very considerable interest and value which had been obtained in the water department itself by a chemist whom they had formerly employed.

Q. All of those matters were taken into consideration by you in your report?

A. Yes, sir.

Q. Those same things were considered in your opinion which you have expressed today?

A. Yes, sir.

Q. There was something asked you this morning as to whether or not you knew the size and general characteristics of the Chicago Drainage Canal. I will ask you to 4708 state if you ever made an investigation as to the width and depth of that canal and the relative flow of water and the speed thereof, so far as the same is of record?

A. I had those figures and have studied them at various times, but I did not have the figures accurately in mind and could not state them off-hand.

Q. Have you ever made any investigation so far as the official government records disclose, of the slopes and basins of these rivers under consideration, in Illinois, and Mississippi and Missouri and the stream flows thereof?

A. I have had such data. I have made plottings of various matters in my office for the purpose of study.

Q. Have you considered all those matters that you have gone through in former years in making up the opinions which you have expressed here today?

A. I have.

Q. Mr. Hazen, considering all other things equally, will the amount of pollution of water which is to be filtered affect in any manner, if so, in what manner, the quality of the water to be furnished after the filtration, assuming of course in that question a modern filtering plant?

4709 A. The operation of filtration does not absolutely eliminate the objectionable matters in the water. It reduces them very largely, reduces them often to such small amounts that we are content to neglect them, but as the removal is not complete, if the amount of pollution of the raw water is increased, it does increase in some measure the danger from the use of the filtered water, and it is for that reason that in locating filter plants—an effort is always made to get a raw water that has as little pollution as possible.

Q. Considering the danger to the St. Louis water supply as coming from the Illinois river, assuming that said river carries infected sewage of the City of Chicago. would that danger be gauged entirely by the average amount of Illinois river water going into the intake every day in the year, or would it be influenced by the amount that might go in there ten or twenty days in the year at flood times, when the Missouri river was low and the Illinois and Mississippi high?

A. Well, that is a very difficult matter to determine. The effect of the water obviously would be very variable upon the water taken at the intake, and the flood washing out the channel and coming down perhaps when the larger rivers were not in flood might result in pollution at the intake, which would represent more damage to the water than the ordinary pollution for months.

4710 Q. Have you ever observed the Illinois river when it was turbid and muddy in appearance?

A. No, sir; I believe not.

Q. Do you know whether or not it does carry suspended matter?

A. I have had records which show that it does at times.

Q. What would that indicate with reference to the question of scouring?

A. That it did scour.

Q. As a sanitary engineer, Mr. Hazen, is the proposition of putting in water filter plants only one of the different lines of mechanics that go to make up the practice of your profession?

A. That is all, sir; it is an important one.

ALLEN HAZEN.

Adjourned to the office of Commissioner Frank S. Bright, 1413 G. St., N. W., Washington, D. C., Monday, July 6th, 1903, 10 a. m.

4711 The Commissioner's Office, 1413 G. street, N. W., Washington, D. C. 10:00 a. m., Monday, July 6th, 1903. Parties met pursuant to adjournment.

Present, the Commissioner, Attorney-General Crow, Mr. Todd.

DR. W. W. WILEY, called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Attorney-General Crow, and testified as follows:

Q. Doctor, will you please give your name and occupation to the stenographer?

A. W. W. Wiley; physician.

Q. Residence, please?

A. Cumberland, Maryland.

Q. Doctor, how long have you lived in Cumberland?

A. About thirty years.

Q. About thirty years?

A. Yes, sir.

Q. How long have you been practicing medicine, doctor?

4712 A. About that same length of time.

Q. Have you been practicing in Cumberland all this time?

A. Yes, sir.

Q. Are you still engaged in business there?

A. Yes, sir; in regular practice.

Q. How large a city is Cumberland?

A. It is about 20,500, sir.

Q. About 20,500?

A. Yes, sir.

Q. Where is it located?

A. In Allegheny county, on the north branch of the Potomac river.

Q. Now, doctor, do you know how far from this city it is by rail and river to Cumberland?

A. By rail it is 153 miles; by river it is about 204. By canal—do you want that?

Q. Why, yes?

A. 184 miles.

Q. What canal is that?

A. Chesapeake & Ohio.

Q. That runs in a pretty straight line, does it?

A. Yes, sir; zigzag.

Q. Where is the terminus of that canal this way?

A. Georgetown.

4713 Q. And Cumberland the other terminus?

A. Yes, sir.

Q. Now, doctor, is there a sewer system in Cumberland at this time?

A. At this time, yes, sir. It has been established pretty thoroughly.

Q. Now, do you remember the typhoid epidemic in 1889 and 1890, in the city of Cumberland?

A. Yes, sir; it commenced in December, 1889.

Q. Do you remember what month it began—you say in December?

A. In December, 1889, near the middle of the month, about the 10th.

Q. What first attracted your attention to it, doctor?

A. It first struck my attention when called in consultation to see a young man sick of it.

Q. Sick with typhoid fever?

A. Yes, sir.

Q. Did it continue for any length of time?

A. Continued up to the following June.

Q. That would be June, 1890?

A. Yes, sir.

Q. Did it increase in severity?

A. It did, sir; there were only about, as far as I could personally learn, the one case, but afterwards I learned of
4714 four cases in December. In the early part of January they cropped up, and February more than in January, and more in March, and then it dropped off in April and May.

Q. And did it increase again after that?

A. No, sir; we had a few cases.

Q. It gradually diminished?

A. Yes, sir.

Q. Now, doctor, do you know whether or not there was any health record kept by the city government at that time at Cumberland?

A. Not by the city government, no, sir.

Q. Now, do you know of your own knowledge anything about how many cases there were there?

A. There were at least 485 cases reported by the physicians society.

MR. TODD: I move to strike out the answer as to what is reported by the physicians, as being incompetent testimony.

Q. Have you any personal knowledge of that?

A. Yes, sir; a good many.

Q. Now, do you know whether or not there was a great many cases of your own personal knowledge aside from what the physicians reported?

A. Yes, sir.

Q. About how many cases do you think you have personal knowledge of? 4715

A. Well, I should say about,—to be within the limits,—270.

Q. That is that you attended and had knowledge of—in consultation with?

A. Yes, sir; had consultation with.

Q. Was that fever pretty well scattered over the town?

A. It was, sir.

Q. Now, at that time, doctor, was there any sewerage connection with the Potomac river directly or indirectly from the houses of the town?

A. Indirectly there were, sir; there were private sewers running into small streams there and they emptied into the Potomac river.

Q. Well, now, just describe that location there so that we can get it in the record, with reference to those running streams that ran into the Potomac?

A. The town is pretty evenly divided in half by Wills creek, that runs north and south and divides it east and west.

Q. What does Wills creek empty into?

A. Into the Potomac river. It commences up in Pennsylvania.

Q. Is there any other creek there, doctor?

A. We don't call them creeks; we call them streams. Yes, there is a stream known as Sulphur Run that comes down Fayette street on the west side and joins with one coming 4716 down Green street, and they together empty into the Potomac. At that time it was above our intake,—above the waterworks about 175 feet above the intake, where the pipe runs out into the river.

Q. There was water in these small streams, was there?

A. Yes, in December, January, February, March and April there was water in them all the time, sir.

Q. Now, do you know whether or not any of these houses had direct sewer connection with Wills creek and this other small creek called Sulphur Run?

A. I do, sir.

Q. Have you personal knowledge of that?

A. Yes, sir.

Q. Do you know whether or not any of the houses in which the people were ill with typhoid fever in 1889 and 1890, had direct sewer connection with either Wills creek or Sulphur Run?

A. Yes, sir; I have.

Q. Can you name some of the people?

A. Yes, sir; Mr. Daniel Arun, cashier Second National Bank.

Q. You attended him, did you?

A. No, sir; I didn't attend him, only in consultation.

Q. Anybody else?

A. Sinclair had two cases.

Q. Did you attend them?

4717 A. No, sir; not directly.

Q. Their houses were connected with the sewers?

A. Yes, sir.

Q. Now, you attended a great many cases there, did you, yourself?

A. I did, sir.

Q. Doctor, at that time did the physicians generally, or did they not generally order the disinfection of the stools of patients, and the urine?

MR. TODD: I object to the question as being incompetent.

A. Yes, sir; they did all that was in their power, they did. Of course in private practice you can't carry it out rigidly; you can't enforce it.

Q. Where it is attempted to be done it does not result in the destruction of all the germs anyway, does it?

A. No, sir; it does not.

Q. Now, these streams, Sulphur Run and Wills creek empty immediatey into the Potomac?

A. Yes, sir; both of them.

CROSS-EXAMINATION, by Mr. Todd.

Q. This epidemic of which you speak occurred between December and June, of 1889 and 1890?

A. Yes, sir.

4718 Q. During that period what system of sewerage was in vogue?

A. We had no general system; it was private; it was individual sewers running into this run, for instance, or into Wills creek, or into a place called Millrix, or directly into the canal.

Q. Was the system of taking care of the household sewage a system commonly known as privy vaults and privies?

A. A good many, sir; a good many of course had closets in the house.

Q. And what proportion of the population had their closets in their houses?

A. In their houses at that time?

Q. Yes.

A. I don't suppose sir, over twenty per cent. had them in their houses at that time. A good many more have now, sir.

Q. The other eighty per cent. used what is known as privy vaults?

A. That is it, sir.

Q. What connections existed between the privy vaults and the Potomac river ?

A. Many of these privies were built right over the edge of these streams, and it was carried directly into the river.

Q. About how many privies were built over the edge of these streams at that time, doctor?

4719 A. Well, I couldn't say, sir. You see there were several streams there, and as I say, there were about eighty per cent.—well, I should suppose there must have been a quarter of them at least flowed into the streams, and may be a little over that, sir; altogether nearly a third connected with the streams direct.

Q. In the city of Cumberland of 20,500—did that population obtain there in that period?

A. No, sir; it was about 12,000.

Q. Of the 12,000 there were about 3,600 people adjacent to the streams?

A. Yes, sir; just about, all these different streams—just about, yes, sir.

Q. Do you know how many people had typhoid fever that occupied houses whose privies overlooked these different streams?

A. No, I couldn't answer that; no, sir.

Q. What part of the city was the epidemic most prevalent in, that along the banks of the river, or away from it?

A. No, sir; away from it.

Q. The wealthier people of the city lived along the banks of the Potomac, did they not, and the rivers?

A. No, sir; no they don't live on the banks; they live out at Washington street; live away from it, on the west side.

Q. Now, what was the class of people that lived along the
4720 banks, the laboring classes?

A. Mechanics and so forth.

Q. Was it there that the typhoid fever cases were the most numerous?

A. No, I can't say it was sir, for instance there is Decatur Street which is pretty far removed from any one of these streams and it had more on it than any street, I think, in town.

Q. And what was the character of the sewers on Decatur Street?

A. Most of those were private, in the yards, and so forth, some few had sewers.

Q. And the household sewage was deposited in privy vaults?

A. Yes, sir.

Q. And there it remained until the period came around when it was removed.

A. Yes sir, but let me tell you, those people on Decatur Street almost nearly all used river water at that time.

Q. You say they did use river water?

A. Yes, sir.

Q. In the treatment of these 270 cases that came under your observation what did you prescribe for the disinfection of the sewage of these patients?

A. You see we didn't have at that time what we have now. A great many of us used bi-chloride of mercury; chloride of lime, carbonate of lime, carbolic acid, bi-chloride of lime,
4721 carbonate of lime—that is carbolic acid.

Q. Those are the disinfectants that were used during that epidemic?

A. Yes, sir.

Q. What directions were given for its use?

A. Well, they were all told to use it before it was emptied into the closets—to use it plentifully on the stool, because we thought the germs were in the stool only, and that is what we used; and then a good deal I have used in the closet itself.

Q. And do you know whether or not this was used?

A. In the different houses?

Q. Yes.

A. O yes.

Q. Was this disinfectant used generally there among the doctors?

A. Many of the more prominent doctors, yes sir.

Q. Now out of the number of cases that you claim were reported something in the aggregate of over 400—270 of those cases came under your personal knowledge and observation?

A. Yes sir.

4722 Q. And these that came under your personal knowledge and observation, was the excrement of those patients treated in accordance with your directions?

A. No sir, many of them were neglected.

Q. And do you know of any that were neglected that emptied directly into the Potomac river and not into privy valuts?

A. Yes, many of them.

Q. How many?

A. I suppose at least half, sir, when you come down to it.

Q. Half?

A. Yes, because you cannot stay there and watch, many of them would not have trained nurses.

Q. Did you ascertain what the cause of the typhoid epidemic was at Cumberland?

A. Well, we had the Secretary of the Board of Health up there for a long time, and we had Prof. Tomery.

Q. No, I asked you if you ascertained the cause?

A. No sir, I don't know sir, only from these gentlemen, and the fact that the people that drank this water seemed to get typhoid fever, and then when the river was abandoned, you might say, almost entirely—well it was abandoned for drinking water, why the typhoid gradually died out.

Q. What town is located above?

A. The nearest town on that river is Keyser, 29 miles.

4723 Q. Was there any typhoid fever in Keyser?

A. There were said to be two or three cases there at that time.

Q. And that was already within the heart of it?

A. Yes sir.

Q. You made no investigation of it?

A. No sir.

Q. What sort of a water system did they have in Cumberland?

A. Holly.

Q. At that time?

A. The Holly water system.

Q. Where was the water secured?

A. From the Potomac, pumped direct and forced to the city; no filtration, just direct.

Q. Of the 270 cases that you treated or had personal knowledge of, doctor, what became of the fecal discharges of those patients?

A. Why, many of them were put into the vault in the yard; many of them were on the surface, and a good many were dumped into the closet in the house, and many of them in the sewer.

Q. What percentage of it would go into the river directly?

A. All over the town?

Q. No, I mean of these patients—that would go directly from the house into the sewer—the houses that had sewer connection?

4724 A. Oh, I should say sir, that 70 per cent., if not beyond.

Q. Now that seventy per cent.; what class of people would that represent?

A. Why, the rich and the poor.

Q. Did the poorer people have the houses connected with private sewers?

A. Not many of them, but they were the classes that were over these streams, on the edges of the streams.

Q. I mean the people that had their houses connected with private sewers?

A. Oh, there would not be seventy per cent. of these, sir;

I mean at least seventy per cent. of the people that were sick, their closets in some way or another connected with these streams that led into the river. You see, as I say up to that time we had no general system of sewerage at all. Since then it has been pretty well sewered?

Q. Did you make any investigation of the typhoid condition except what you found in Cumberland?

A. No sir.

Q. What occurred below Cumberland?

A. Well, I communicated there with a doctor at Hancock. That is a place sixty miles below Cumberland, and soon after we had our epidemic in Cumberland they began to have cases at Hancock, but I never heard the number; but they had 4725 quite a number of cases at Hancock and accused us of communicating it to them.

Q. What proportion of the typhoid fever cases used the private vaults?

A. That would be hard for me to tell exactly, sir, how many typhoid fever patients used the private valuts?

Q. Yes.

A. I couldn't tell exactly that, sir.

Q. Is there any more difficulty in telling the number of patients that had typhoid fever that used the privy vaults than the percentage of typhoid excreta emptied into the Cumberland, the Potomac and the other two rivers or streams?

A. I say they all must have, excepting the one street, Decatur street is the only street that I know of in town, where the sewers could not reach the river—the only street, and that at the present time has no system of sewers, and as I say, out of the 485 cases there, if I could tell exactly how many cases occurred on Decatur street, I could tell you about what the percentage would be.

Q. Exclusive of those cases that occurred in houses where the privies overhung the river, how long would it take sewage to get from the other houses into the river?

A. Why with the water running that way, it would take 4726 a very few hours, sir.

Q. They had waterworks, did they?

A. Yes, all those that had these private sewers had water connections.

RE-DIRECT EXAMINATION, by General Crow.

Q. Doctor, was the intake at that time below the place where some of these creeks into which sewers ran, emptied into the Potomac?

A. Yes sir, only about 175 feet, I guess, below.

RE-CROSS EXAMINATION, by Mr. Todd.

Q. Where was the intake of the water supply of Cumberland located at that time?

A. Why, it went right out into the river from the water works. The water works was directly on the edge of the river and it went right out.

Q. How much of the city was built above the water works?

A. Let's see, at that time about one-third.

Q. And was the water works located below the creeks or small streams that divided the city?

A. No, it was below the stream that as I say, comes
4727 down Fayette and Green Streets and then the creek communicates with it. You see there is a dam along there forming a basin.

Q. The sewage of Cumberland, a part of Cumberland itself, entered the water above the intake?

A. Yes sir.

Q. And the water itself that got into the intake was contaminated and polluted by the sewage discharged from Cumberland itself?

A. Yes sir, and those streams above it unite and form one stream and did come in about 175 feet above the water works.

Q. Now then—

A. They carried that pipe up along the bank, 1,500 feet further up so as to be on that stream.

Q. About what proportion of the population drained into the river above the intake?

A. At that time?

Q. Yes.

A. About one-third of the population.

Q. How large a river is the Potomac at Cumberland?

A. It is about 300 yards wide, sir.

Q. How deep?

A. Well, the deepest place is about 29 feet.

4728 Q. Is it navigable?

A. No sir, only canal boats.

Q. And at the time that this epidemic began in December, was it at a high or low stage?

A. Well, about middle then, sir.

Q Had the winter set in?

A. Well, the river don't generally rise; it freezes over you see in December, and breaks up then about the latter part of March.

Q. Well, during December, when it freezes—the Potomac rises in the mountains, does it not?

A. Yes sir.

Q. And the streams that feed the Potomac, when they become frozen in the winter, the Potomac falls, does it not?

A. No sir, I could not say it does; it keeps up pretty well about the same.

Q. It keeps up pretty well?

A. Yes sir.

Q. Have you any idea about the volume of water that would pass a given point at a given time at this period of the year in the Potomac?

A. No sir; I have heard that given in the trial of the city of Cumberland against the Pulp Paper Mill Company. That was tried, I think, three times.

4729 Q. But you have no recollection of that?

A. No sir.

Signature waived. F. S. B. Com'r.

Adjourned until 2 o'clock p. m. same day, Monday, July 6, 1903, at Office of Weather Bureau, Washington, D. C.

4730 2:00 p. m., Monday, July 6th, 1903.
Weather Bureau, Washington, D. C.

Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

WILLIAM B. STOCKMAN,

called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Attorney-General Crow and testified as follows:

Q. Will you please give the stenographer your name, residence and occupation?

A. William B. Stockman, District forecaster United States Weather Bureau; residence, Washington, D. C.

Q. How long have you been in the Weather Bureau service?

A. Over twenty-five years.

Q. What district are you superintendent of?

A. I am in charge of the division of meteriological records.

Q. Does that division have charge of the rain precipitation over the area covered by the watershed of the Illinois, Missouri and Mississippi rivers above the city of St. Louis?

4731 A. It has a record of the precipitation throughout the country—has charge of it.

Q. Now I show you here two charts marked "United States Department of Agriculture, Weather Bureau." Can you identify those; if so, tell me what they are?

A. Rain precipitation; they represent the mean annual rainfall of the various places mentioned or indicated.

Q. Are they copies of the official record?

A. They are copies.

Q. Now do you know anything about that map that I show you?

A. That is simply indicating the stations to be selected in the various river districts.

Q. That red line does not include the watershed?

A. Well, that is supposed to as I understand it; that was given me to extract the data for.

GENERAL CROW: Mr. Todd, examine those. I want to offer them in evidence if there is no objection to them. The books are right here, but I thought we could offer copies of them. Is there any objection to the form of the testimony?

MR. TODD: I won't object to the form; I simply object to the materiality.

Q. GENERAL CROW: Now begin here at Chicago, Illinois, and these places, what do these figures out on the side here

represent? Just explain the chart so that the Court will
4732 understand what is meant by it?

A. Suppose I go to Chicago and show you just exactly what it does mean, from the figures.

Q. All right.

A. (Witness refers to book). Each entry here represents the total amount of precipitation in that month and year; that is 1871, January, February, and so on. That means the total amount of precipitation for the twelve months of the year, and so on all through the length of the record.

Q. These figures at the side here then in this column (indicating) represent the average of the years since 1871?

A. Well no, that chart is only brought down to and including the year 1895. We are now working on one which will bring them up to 1903.

Q. And that is as far as these figures go then?

A. Yes, that is as far as they go.

Q. You have the figures though in that shape from 1895 to 1903?

A. Oh yes, they are all here, yes sir.

Q. All we want to get out of this is to get the date when each one of these stations began; I suppose that marks the time when you began the record?

A. Yes sir.

4733 Q. Now will you take the record and give the stenographer the dates when Chicago began, and Ottawa?

A. At Chicago; this is the record up to and including the year 1895, beginning January, 1871.

Q. And the figures here represent the mean average for those years inclusive?

A. It represents the mean average from 1871 to 1895 inclusive. Those are our regular stations, they are called voluntary—Springfield, Illinois—

Q. You haven't the record then for Ottawa?

A. Oh yes, we have but not in these books; these are the books for our regular weather bureau stations.

Q. That is the average annual fall?

A. Yes, you see that is the mean of taking these 25 years, the sum of them.

Q. The mean annual rainfall?

A. The mean annual rainfall. Duluth is from January, 1871 to 1895, inclusive. These books are arranged alphabetically; at least the dating of them are alphabetical. Davenport is the same. Now Dubuque will be from 1874 to 1895. Des Moines is from 1879 to 1895.

Bismark is from 1875 to 1895.

Cheyenne is from 1871 to 1895.

4734 Concordia is from 1886 to 1895,

Denver is from 1871 to 1895,

Kansas City is from July, 1889, to December, 1895,

Hannibal, Missouri, is from May, 1892, to December, 1895,

Havre, Montana, is from—including Fort Assinibon from 1880 to 1891, and Havre the remaining four years,

Helena is from April, 1880 to 1895,

Keokuk is from July, 1871, to 1895.

Q. That is your official stations?

A. Yes, those are our regular stations. Did I give you Huron, South Dakota?

Q. No sir.

A. Huron, South Dakota, is from July, 1881 to 1895,

LaCrosse is from November, 1872 to 1895.

Q. Do you make proportionately that many observations over the entire country, as many as in this district?

A. That is about the proportion. I think it is more in the eastern part of the country.

Miles City is from October, 1891 to 1895.

Lincoln, Nebraska, is a broken record, but it is a very complete one from 1885. You see the months are missing in through there (indicating on book).

4735 Lander, Wyoming, is from January, 1888 to 1895, with a broken record; an estimated record in June and July, 1891.

North Platte is from October, 1874 to 1895,

Omaha is from 1871 to 1895,

Pierre, South Dakota, is from July, 1891 to 1895,

Springfield, Missouri—there is a straight record from October 1887 to 1895.

Springfield, Illinois, is from July, 1879 to 1895, Sioux City is a very clear record from 1883. November and December of 1888, and January, February and March in 1889 missing.

St. Louis is from 1871 to 1895.

Q. Is the precipitation heavier in these valleys than it is in the east?

A. Well, not as a rule. Rapid City is from February, 1881, to May, 1883, inclusive, and from January, 1883 to 1895.

St. Paul is from 1871 to 1895,

Topeka is from June, 1887 to 1895,

Valentine is from September, 1885, excepting January and February, 1893.

Williston is combined with Fort Buford, which runs from February, 1879 to 1895, and November, 1893, not considered.

Yankton is from April, 1873 to 1895. That is all of the
4736 voluntaries.

Ottawa is from March, 1856, to November, 1870, excepting January, 1857; October, 1860; June and July, 1863; and January, May, 1865; November, 1867; November and December, 1868; January and September, 1869; December, 1870; October, 1868; October, November and December, and a straight record from October, 1886.

Peoria is from December, 1855, to December, 1874, and perhaps June. It goes right on excepting—oh yes, that is complete to 1895.

Beardstown is a broken record from April, 1885, excepting October, November and December, 1888; January, February and March, 1889, and in the years 1898, 1899, 1900 and 1901, but we don't want to run that far.

Q. There is no annual amount put in here (referring to chart). Is it figured up there?

A. At Beardstown?

Q. Yes sir.

A. Well it is such a broken record, I guess that is why they didn't use it. I can give you the mean from 1890 to 1896, the complete years, if that will answer. It was 38.03.

Q. Now have you got the figures for those places from
4737 1895 to 1903?

A. Yes sir.

Q. But you have simply got the figures for each year?

A. Yes, amount each year.

Q. Well, could you get that and just read that into the record, just the amount? Now, I will tell you; we will save a lot of time in this matter for ourselves, and you can have it done at your leisure, too, if you will just have copied into these sheets here the amounts of the rainfall for the years 1895 to 1903 for these stations.

A. That is pretty considerable of a task. If the annual values will answer as well, we can do that.

Q. The annual, just as you have it here?

A. Yes, just as it is there.

Q. Well, that will do just as well.

A. Well, if it will—it is only one-thirteenth of the work.

Q. And you can just mail it to Mr. Bright here in this city.

A. Very well, sir.

Q. Now you don't know whether that represents accurately the watershed or not?

A. No, I do not. If you wish any data from any other of the stations that you think—

Q. No. I just want the watershed of these three rivers; 4738 there are no other stations in the three watersheds?

A. I don't know; I haven't looked that up.

Q. Well, if there are, will you please insert them in here?

A. Well, I don't know anything about watersheds.

Q. I think from the looks of it, it does cover it, it comes up to the divide, Lewiston is over the divide.

A. Well, I will just make up the annual values from 1896.

THE COMMISSIONER: Do you want these charts identified in any way?

GENERAL CROW: Yes, you put your mark on them and identify them.

THE WITNESS: Or you may take those and just give me a list of the stations. That is all I care for. Now if you will call those off to me, I will put them down.

THE COMMISSIONER: (Reading from chart):

Chicago, Illinois,
Ottawa,
Peoria,

Beardstown,
Springfield,
St. Louis,
Duluth,
St. Paul,
LaCrosse,
4739 Dubuque,
Davenport,
Keokuk,
Des Moines,
Hannibal,
Havre,
Williston,
Helena,
Miles City,
Bismark,
Pierre,
Huron,
Rapid City,
Yankton,
Valentine,
Lander,
Cheyenne,
North Platte,
Sioux City,
Omaha,
Lincoln,
Denver,
Concordia,
Topeka,
4740 Kansas City,
Columbia,
Springfield, Missouri.

Charts are marked by the Commissioner "Complainant's Exhibits 71 and 72."

THE WITNESS: Now would you like these data certified to?

GENERAL CROW: Yes, you can certify them if you will.

Certified charts marked "Complainant's Exhibit 73." Frank S. Bright, Commissioner.

CROSS-EXAMINATION, by Mr. Todd.

Q. Mr. Stockman, in getting these averages for the periods that you have indicated, are the averages taken by months or by years?

A. We take the total for the months, the amount for the months of the year; and for the annual, we take the annual data.

Q. And these figures that represent, take for instance, Chicago, 34.76, what does that mean?

A. The mean annual precipitation at Chicago.

Q. In what measurement?

A. In inches.

Q. And that is true all through?

A. That is true throughout. We use the same method and the same measurement. The monthly values appear in these books you see (indicating the records).

4741 Q. Yes, that is all I wanted to find out.

Signature waived.

Adjourned to the Commissioner's office, 1413 G Street, N. W., Washington, D. C., until 3 p. m. same day, Monday, July 6th, 1903.

4742 3:00 P. M., Monday, July 6th, 1903.

Office of the Commissioner, 1413 G. Street, N. W., Washington, D. C.

Parties met pursuant to adjounrment.

Present, the Commissioner and same counsel representing the respective parties.

WILLIAM C. WOODWARD,

called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Attorney-General Crow and testified as follows:

Q. Doctor, will you please give the stenographer your name, address and occupation?

A. William C. Woodward, 508 I Street, Washington, D. C. I am health officer of the District of Columbia.

Q. How long have you lived in the District of Columbia?

A. My entire life, since 1867.

Q. How long have you been Health Officer of this city?

A. Since August 1st, 1894.

Q. The office of Health Officer of this city is created by what statutes?

A. By an Act of Congress passed some time in 1878.

4743 Q. What are the duties, generally speaking, of the Health Officer of the District of Columbia?

A. They are to execute and enforce all laws relating to public health, and to keep a full and correct record of vital statistics and to perform such other duties as may be assigned by the Commissioners of the District.

Q. The keeping of the records of the vital statistics includes records of marriages, births, deaths and diseases of different kinds?

A. It includes now the records of births, deaths, and the various sources of diseases; we do not now keep records of marriages.

Q. Do you keep a detailed history of the individual cases in different diseases?

A. Yes, sir.

Q. How long has that record been kept?

A. The detailed history of the individual cases has been kept for various lengths of time in various diseases. Of course it will depend somewhat upon what you mean by detailed history.

Q. Well, for instance typhoid fever, water and the milk and the diet?

A. Well, typhoid fever has been reportable in the District of Columbia since about February, 1902, and ever since that time we have been keeping a detailed history of the cases as to milk, water supply, diet, etc. 4744

Q. Now before you became Health Officer, were you connected with the Health Department?

A. I was for about a year before I became Health Officer, Coroner for the District, and for six months prior to that time I was physician to the poor in the health office.

Q. Prior to the date you last mentioned, you practiced medicine in this District?

A. For about six months prior to that I was physician in charge of the emergency hospital, and prior to that time I had practiced medicine since about 1892.

Q. Of what school are you a graduate?

A. University of Georgetown in this city.

Q. Are you the official custodian of the vital statistics as recorded in the District of Columbia under the Act of Congress?

A. Yes sir.

Q. The records of your office are the only official records of the vital statistics?

A. Yes sir.

(Counsel for Complainant hands papers to counsel for
4745 defendants).

GENERAL CROW: Any objection to the form of it?

MR. TODD: No, I don't object to the form. I object to the competency.

Q. GENERAL CROW: Now, doctor, I show you here what purports to be a statement showing the number of deaths from typhoid fever, typhoid malarial fever, malarial fever and diarrheal diseases, occurring in the District of Columbia during each month from January, 1885, to December, 1895, inclusive. I will ask you if that was made from records in your office?

A. Yes sir.

Q. Is it a correct copy?

A. To the best of my knowledge and belief it is.

Q. That is your signature attached to the certificate?

A. Yes sir.

Q. And the official seal of the District of Columbia?

A. Yes sir.

Q. And the official seal of your office?

A. Yes sir.

GENERAL CROW: Now I offer that in evidence.

Said document received in evidence and marked by the Commissioner Complainant's Exhibit 74.

MR. TODD: I object to it on the ground of its incompetency.

Q. GENERAL CROW: Now, doctor, in your capacity
4746 as Health Officer you have also had charge of the records
or record of vital statistics from 1895 on up to 1902?

A. Yes sir.

Q. Have you got the records of the deaths—the typhoid fever cases and the deaths for the year 1902?

A. I have the record of deaths, but I have not the record of cases with me. That is an original table, I cannot leave that with you.

GENERAL CROW: Now, Mr. Todd, this is an original record in his office there, and the only way I can get it into the record is to copy it in.

MR. TODD: Just read it in.

Q. GENERAL CROW: I will ask you, doctor, to just begin at 1895 and read those figures.

A. Do you want them by months?

Q. Yes, by months, and the totals, just as you have it there.

A. The total you see covers ten year periods; that won't give it.

Q. Well, just read it by months.

A. We can put in the totals afterwards. This is by calendar years, January, 1895, to 1903.

Q. That gives cases or deaths?

A. These are deaths.

Q. All deaths?

4747 A. Yes sir.

January, 1895, 0 deaths,
1896, 9 deaths,
1897, 13,

1902, 20.

4751 Do you wish the totals?

Q. Well, have you got the totals?

A. Yes, totals for each year:

1895,	201,
1896,	141,
1897,	121,
1898,	182,
1899,	194,
1900,	218,
1901,	169,
1902,	226.

Q. Have you got the rates per thousand?

A. Rates per ten thousand. These are for population, rates per 10,000:

1895,	7.49,
1896,	5.17,
1897,	4.39,
1898,	6.56,
1899,	6.97,
1900,	7.83,
1901,	6.06,
1902,	7.99.

Q. Now, Doctor Woodward, as health officer of this city have you had occasion to investigate the water supply of the city at various times?

4752 A. I have made personal inquiries into its condition, but I never investigated the watershed, nor personally made bacteriological nor chemical analyses, though I am familiar with the work that has been done along both lines.

Q. You are familiar with the aqueduct that you have here?

A. Yes, sir.

Q. And the water plant in general?

A. Yes.

Q. You are familiar with the general sanitary conditions in the city?

A. Yes, sir.

Q. And with the typhoid rate?

A. Yes, sir.

Q. Now, I will ask you what in your opinion is the principal cause of typhoid fever in this city?

A. My own opinion, after a very careful consideration of the entire subject is that the chief cause of our typhoid fever is our Potomac river water.

Q. Have there been any steps taken to remedy that?

A. Yes, sir.

Q. What steps?

A. The Federal Government now has in course of construction a filter plant to filter the entire public water supply of the District of Columbia.

4753 Q. What kind of a filter plant?

A. By means of slow sand filtration.

Q. Was that by Act of Congress?

A. Yes, sir.

Q. What kind of pollution in your opinion, is it that renders bad the Potomac river water at this point?

A. Human excreta, I think.

Q. And sewage pollution?

A. Yes, sir.

CROSS-EXAMINATION, by Mr. Todd.

Q. Dr. Woodward, you don't hold yourself out as an expert on typhoid fever, do you?

A. No, sir.

Q. You don't hold yourself out as an expert on causes of epidemics, do you?

A. No, sir. I will cover all those questions by saying that I don't hold myself out as an expert on anything.

Q. And when you give an opinion in regard to the causes of typhoid fever in the city of Washington, is that an opinion of an expert upon the subjects to which you testify, or simply the opinion of a layman, so-called, as distinguished from an expert?

4754 A. I will have to leave it to others to determine whether I am an expert or not. I don't hold myself out in any case. I have carefully studied the subject of typhoid fever in the District of Columbia since 1894. I have especially closely studied the subject of water supply here and elsewhere, and as the result of that study, covering a period of nearly nine years, I have expressed that opinion.

Q. Then you do express an opinion as an expert upon the subject concerning which you have expressed the opinion?

A. That, as I say, I have expressed the opinion, and I stated my experience. I will leave it to the Court to determine whether I am an expert or not.

Q. Now, in your conclusions or opinion that the cause of typhoid fever is from the Potomac river water, is that the only cause of the typhoid fever in the city of Washington?

A. Absolutely not.

Q. Washington is a peculiar city in this, that it is visited by people from every other city and country in the world, is it not?

A. Well, that of course applies to all cities more or less. We have a considerable number of visitors, of course.

Q. Well, you have more people visiting here from different cities, than almost any other city, by virtue of the fact that 4755 it is the capital of the country, don't you?

A. We have, I presume, more pleasure seekers and sight seers of that class, but when it comes to business,—along the line of business I presume commercial cities have a larger percentage of visitors than we have, though I know nothing of it, of course; I have never investigated the subject.

Q. Do you regard the water of the Potomac as the sole cause of the typhoid fever in the city of Washington?

A. No, sir.

Q. What other causes do you consider as contributing to the typhoid fever?

A. In the first place we have of course the direct infection of one patient from another, as in the case of nurses.

In the second place we have a great number of persons who are infected through milk.

In the third place we have a certain number,—possibly we have never discovered them,—I say possibly, who are infected through oysters and vegetables eaten raw.

In the fourth place we have persons visiting here from other cities, or persons who are returning from summer resorts who are residents here, who develop the disease, and then finally, we have the class of persons who develop it from drinking water, either well water or Potomac river water, as against one 4756 of those classes,—that is the class of persons who contract the disease elsewhere, and develop it here, and the opposite. Of course the persons who contract it here and develop it elsewhere will probably even it up.

Q. Have you any statistics showing the number of persons who contracted it here and developed it elsewhere.

A. Absolutely none.

Q. How, then, are you able to offset one against the other?

A. I don't offset them in actual figures. But we know that if persons living here develop typhoid fever, that the persons who come here for brief stays are liable, and in the natural course of events do contract typhoid fever. We know that our citizens go to other places and develop it, and come home with it, and there is no reason to believe that the situation is different with respect to other persons who may come here and go home.

Q. What percentage of the total typhoids in Washington city would you attribute to the water of the Potomac?

A. Speaking from memory, as to the result of the investigation of a large number of cases that we had last year, I should say from sixty to seventy per cent., and possibly more, and that is from memory, but we carefully investigated it, and that is my best recollection.

Q. And the other thirty or forty per cent. you attribute 4757 to the causes as you have indicated in your previous answer?

A. Yes, sir.

Q. In the investigation that you conducted, that disclosed the sixty or seventy per cent., what did you do in order to arrive at that conclusion?

A. Each case of typhoid fever is investigated by an inspector, who visits the premises for that purpose. He gets the history as nearly as may be of the onset of the case, and the history of the patient prior to its onset as to absence from the city, as to water supply and general food supply, and as to exposure to other cases. Then if we can find any reasonable cause to attribute the case to, or any definite cause, it is so attributed. When it comes to attributing cases to our Potomac river, we have done so only, you may say, as a last resort. A man who is using a milk supply in common with hundreds of others; a man who has not left the city, and a man who has not used well water or spring water, has presumably gotten his typhoid from the great source of the disease, and that is from the water he drinks,—the Potomac river water. It is not of course an absolute demonstration, but you cannot make absolute demonstrations in cases of that kind.

Q. It is speculative largely, is it not?

4758 A. I would rather have you define the term "specuative" I should say—

Q. Not being an expert, but a lawyer, I am absolutely unable to.

A. Well, I should say then that it was a demonstration, not beyond a reasonable doubt, but by a preponderance of the evidence.

Q. Were you able to tell whether those cases that you said came from the Potomac water did not as a matter of fact come from eating oysters?

A. Only by the statements of the patients, that they had not used oysters.

Q. Then you have to rely upon the statements of the patients?

A. Absolutely, in medicine.

Q. And are those statements made at the beginnig or at the close of their cases?

A. They are made as soon as practicable after the reports of the cases. In the investigation last year, that varied very widely. Some of those statements were made promptly and others were made, you might say, some time after the recovery, because the cases came in so rapidly we could not keep up with them, so I could not make a general answer to that question.

4759 Q. Do you know whether they were interrogated, the majority of them, in the beginning or in the convalescing stage of the typhoid?

A. I should say that probably—and you will have to allow me to correct the statement, that it is the patients, because sometimes it is by those in attendance upon the patients—I should say that probably in the majority of cases it was some time after the beginning of the cases.

Q. Do you know how many of those patients were delirious at the time that these statements were made?

A. I think I can safely say none.

Q. Does not the typhoid patient become delirious after three or four days of the disease?

A. Not in the majority of the cases.

Q. You regard then a man with typhoid fever after three or four days duration of the disease, in the majority of cases, as having a mind not in a state of delirium?

A. In the majority of cases?

Q. Yes.

A. I so regard them. I might add that the investigation was made by a medical man, as bearing on the question that the interrogations were not made to a patient in a state of delirium.

4760 Q. It is sometimes rather difficult to ascertain whether a patient is delirious or not, isn't it, unless you are with him a good while?

A. No, I think not. It has not been my experience.

Q. Have you ever had typhoid fever yourself, doctor?

A. No, sir.

Q. Now, in arriving at this percentage that came from the Potomac river water in the city of Washington, would you say that that percentage is accurate?

A. I testified before that that was merely from the best of my recollection, so that I could not say that that was accurate.

Q. Now, in the statement that you read I notice that the totals in the first column of figures—what does that total mean?

A. Those are the totals that I read (referring to paper).

Q. Didn't you read those in?

A. No, that includes three years that were in the other table, so I read from 1895 down. Those are the totals that I read (indicating). The totals that I read represent the total number of reported deaths from typhoid fever during the years indicated.

Q. 1893, 1894 to 1900?

A. Yes, sir.

Q. What is considered as an epidemic of typhoid fever; what death rate?

4761 A. I would be unwilling to define the term "epidemic." The term has no definite meaning, and it is impossible to state what an epidemic is.

Q. In this table marked Exhibit No. 73, you have what is known as typho malaria and typhoid fever. What is the difference between typhoid fever and typho malaria?

A. I regard a case of typho-malarial fever as a case of typhoid fever, in which the physician has made a mistake at the beginning and called it malarial fever, and he seeks the best way to get out of the hole. We classify them separately because some people regard them as different diseases, and we furnish our statistics to people and let them use them as they see fit, but I have expressed my opinion.

Q. You give the people what you think they want, then?

A. We give it to them and they can call it typhoid fever, or typho malarial fever, as a distinct disease.

Q. But is there a distinction as a matter of fact between typhoid fever, typho malaria and malarial fever?

A. There is a very marked distinction between malarial fever and the other diseases, unless you regard the typho malarial fever as typhoid fever. When it comes to typho malaria and typhoid fever, the best authorities today I believe, regard them as the same disease.

4762 GENERAL CROW: In other words, they don't recognize typho-malaria at all?

A. No, sir.

MR. TODD: In the study of these statistics how does the public health of the city of Washington compare with other cities of similar size, with regard to typhoid fever?

A. The typhoid death rate is high, according to the United States census figures, which I have recently gone over for a purpose other than this,—the present inquiry—there were about two large cities that excelled it in the typhoid fever death rate. One was Pittsburg, and the other Atlanta.

Q. How did Philadelphia compare wiih it?

A. Philadelphia was below. These were United States census figures and may or may not be correct.

Q. These tables merely show the deaths from typhoid fever?

A. Yes, sir.

Q. The number of cases are not tabulated in these?

A. No, and it has been only since February 1st, I think it was, sometime in 1902, that the cases have been reportable.

Q. What is considered a normal death rate from typhoid for 10,000 inhabitants?

A. It would be hard to fix a normal death rate from a
specific disease of that kind. I should say that the death
4763 rate should run down certainly not above ten.

Q. I notice that from 1893 to 1902, according to this table submitted here, that the rate per 10,000 of population under that heading is a figure for 1893 of 7.43; what does that mean?

A. That is,—I should have said one instead of ten. In that case it was 100,000, I was figuring on. That means that out of every 10,000 people in the city for one year that number died from typhoid fever.

Q. Then a normal death rate would be one in 10,000 people?

A. I could not say a normal death rate. There is no normal death rate for typhoid fever. We should have none, but I should say that it should not exceed that; but that would not be normal. We should have none.

Q. Do you know of any city on the American continent where the death rate from typhoid fever is one in 10,000?

A. I would not undertake now to recall the death rates of the various cities. I could not answer that question without reference to the statistics.

Q. The water of the Potomac is a polluted water, is it not?

A. I so regard it.

Q. And where does it get its pollution from?

A. The pollution of course varies in its nature and varies
in its origin. You get part of the pollution from the
4764 bottom of the stream, part from the banks and part from
the drainage, from the habitations that border on the
stream.

Q. The stream runs through a very thickly settled country, does it not?

A. It cannot be regarded as thickly settled.

Q. Are there any cities lying on its shores?

A. There are some small hamlets from place to place, and then within a distance of 152 miles up there are nine communities, the largest of which, according to the latest United States census has a population of 17,128; the smallest of which has a population of 824.

Q. Are there any streams that empty into the Potomac?

A. Quite a number.

Q. Are there any cities or towns located upon those tributaries?

A. Yes, small places that border on them. This includes the two branches, the Shenandoah and the Potomac proper. The Shenandoah is an independent stream, and yet it comes in at Harper's Ferry as quite a large branch, as big as the Potomac I think, and the statement I made includes both branches. The distance as given, of 152 miles represents the distance above the Great Falls. We get no water for our water supply below that point, so they measure the distance above Great Falls.

4765 Q. What do you mean by Great Falls, a place right near Washington, here?

A. Yes, 15 miles up about, up the river there is what we call the Great Falls. Our dam is across the river there.

RE-DIRECT EXAMINATION, by General Crow.

Q. Do you know, doctor, the number of cases in this city in 1902, of typhoid fever—do you recollect them?

A. I don't recollect them. I looked them up this morning, but made no note of them.

Q. Do you know the approximate number?

A. To the best of my recollection, it was about 1500 or 1600.

Q. Doctor, will you please give me the names of those nine towns on the watershed above your intake, and their population and distances from this city?

A. Distance from Great Falls?

Q. Yes, from your intake?

A. Harper's Ferry, West Virginia, 44 miles; population, 896;

Shepardstown, West Virginia, 54 miles; population, 1184;
Charlestown, West Virginia, 54 miles; population, 2392;
4766 Williamsport, Maryland, 75 miles; population, 1472;
Front Royal, Virginia, 84 miles; population, 1005;
Hancock, Maryland, 84 miles; population, 824;
Cumberland, Maryland, 127 miles; population 17,128;
Keyser, West Virginia, 147 miles; population, 2536;

Piedmont, West Virginia, 152 miles; population, 2115;

The measurements are taken from the annual report of George H. Elliott, Colonel, Corps of Enginers United States Army, in charge of the Washington aqueduct by appendix B B B of the annual report of the Chief Engineers for 1894. That is, the distances were taken from that and the population figures are taken from the last annual report of the census office.

Q. Doctor, do you know whether or not any of those towns have sewers that have outfalls into the Potomac river?

A. I don't know about that.

Q. They are in the drainage shed of the river, however?

A. Yes, sir.

GENERAL CROW: Now, Mr. Todd, I want to introduce some photographs taken of the intake tower, St. Louis, and our settling basins, and I want to introduce some maps of statistics, and I want to have Dr. Ravold fix that map that he has,
4767 and then have that man Goetz come over from Pittsburg, Pennsylvania, and I will have to get him to come here or have Mr. Bright go there and have him sign his testimony; and then there are some weather maps I want to put in; but I am perfectly willing to offer all that at Chicago or some time later. There is no more expert testimony that I want to put in and no more facts that will interfere in that way, and with that understanding I am willing to close my side of the case.

Signature of Goetz subsequently waived.

THE COMMISSIONER: The chief, except as indicated, is closed this 6th day of July, A. D. 1903.

ADJOURNED.

4768 10:00 a. m., Friday, July 10, 1903. Southern Hotel, St. Louis, Missouri.

Present: The Commissioner, Judge W. C. Johns, representing the State of Illinois; Mr. James Todd, representing the Sanitary District of Chicago; Messrs. Crow and Jeffries, representing the complainant.

The Commissioner announced that he was now ready to hear defendants' case, complainant having agreed to waive notice, and thereupon defendants announced that there were no witnesses present, and by consent an adjournment was taken to July 13, 1903, on board the Illinois Fish Commission Boat, "Illinois" at the foot of Vine Street, St. Louis, Missouri.

10:00 a. m., Monday, July 13, 1903. On board the steamer "Illinois," continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

Whereupon the following evidence was offered in behalf of the defendants, to wit:

4769 AUGUST JOHNSON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, testified as follows:

DIRECT EXAMINATION, By Mr. Todd.

Q. What is your name?

A. August Johnson.

Q. Where do you live?

A. Where I live now?

Q. Yes.

A. In Burnesville, Missouri.

Q. Did you live at 407 Espensthieh Street?

A. I never lived there, but I always had my mail delivered there.

Q. Where did you live in St. Louis.

A. I lived South of River Des Peres, in the southern part of the city limits.

Q. Did you have anything to do with taking samples of water?

A. Yes, sir.

Q. For whom did you take these samples?

A. I think it was for the Sanitary District of Chicago.

Q. Where was this water taken from?

A. Opposite Jefferson Barracks.

4770 Q. In the Mississippi River?

A. Yes sir.

Q. When?

A. 1899 and 1900.

MR. JEFFRIES: We move to strike out all the witness' testimony with reference to samples taken at Jefferson Barracks from the Mississippi River, for the reason that it is irrelevant and does not tend to prove any issue in the case.

Q. MR. TODD: Did you receive instructions as to how to take the water?

A. I had instructions from the certificate—on the back of the certificate was all the instructions that I had.

Q. From whom did you get these instructions?

A. Well, the instructions, as I said before; I only had instructions on the back of the certificate, I was appointed by Dr. Palmer of the University of Illinois.

Q. I will ask you to examine these cards and state whether the cards are in your handwriting and made by you?

A. Yes sir, I made all them. They are all in my handwriting.

Q. The instructions which you had are printed on the back of these cards, are they?

A. Yes sir.

4771 Q. Did you follow out these instructions?

A. As closely as I possibly could, yes sir.

Q. Now, after you took the water, according to the instructions, what did you do with it?

A. After I took the water I sealed the bottles, packed them in ice and shipped them to the University of Illinois, the University of Chicago, at Chicago, Illinois, and to the Health Department of Chicago.

Q. To whom did you send them to the University of Illinois?

A. Dr. Palmer.

Q. To whom to the University of Chicago?

A. Professor E. O. Jordan.

Q. And to whom to the city of Chicago?

A. To the laboratory at Chicago.

Q. Dr Reyonlds?

A. No, there was no address, only Health Department, City of Chicago, No. 11, City Hall, I don't recollect the number, anyhow to Health Department City of Chicago.

Q. After you had sealed the bottle of water did you place a tag similar to the one that I hand you, upon all the water that you shipped to Prof. Palmer at Champaign, Illinois, of the University of Illinois, Prof. E. O. Jordan of the University of Chicago, and the Health Department of the City of Chicago?

A. Yes sir, they were all shipped alike; all samples were collected at the same time and all treated alike in the shipment.

Q. You numbered the samples, did you?

A. I numbered them, yes sir.

4772 Q. You placed the date on the ticket?

A. Yes sir.

Q. You placed your name upon the ticket?

A. Yes sir.

Q. You placed the height of the water?

A. Yes sir.

Q. The temperature of the water?

A. Yes sir.

Q. The direction of the wind?

A. Yes sir.

Q. The temperature of the air?

A. Yes sir.

Q. And noted about whether it rained or not?

A. Yes sir, I noted that.

Q. By what express company were all these samples shipped?

A. The Pacific Express Company.

Q. Just describe in your own way how you collected the water from the river?

A. Well, the way I collected it was to remove the stoppers, and I held the bottles a certain distance under the water to let it run in, and then I would take it out of the water, put stoppers on and they were taken to the shore where they could be sealed; sealed and packed in ice and forwarded to the different parties.

4773 Q. Where did you get the bottles from?

A. The bottles were sent to me from the University of Illinois, University of Chicago and the Health Department of Chicago.

Q. Did you have any apparatus for handling the bottles?

A. No sir.

Q. What part of the Mississippi River did you take the samples from?

A. From the west side, center and east of center, as near as I could judge the distance.

Q. You took how many samples at a time?

A. At three points across the river.

Q. You began taking samples when?

A. As near as I can recollect in August, 1899, first week of August, somewhere in there.

Q. Before that time you took samples did you not?

A. Before that time I only assisted.

Q. Whom did you assist?

A. Emil Appel.

Q. How long did you assist him?

A. I believe it was something like two months, six or eight weeks, I don't remember exactly how long.

Q. And was the water that you and Emil Appel collected treated in the same manner that it was treated after you began taking it?

A. In the same manner, yes sir.

4774 Q. You saw the water shipped at that time?

A. I did not see it shipped. I never saw it put on, because I never stayed long enough to go on the train, but I seen it put up.

Q. When did you cease taking water?

A. I believe in September or October, 1900, I don't know the date exactly now, I can't recollect that.

Q. The cards that you sent to Chicago show the dates?

A. They give the dates, they show the dates, yes.

MR. TODD: Mr. Commissioner, I will ask to have this card marked for identification as "Sanitary District of Chicago's Exhibit 1 for identification."

Said card is so marked by the Commissioner.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. When did you say you took these samples?

A. In 1899 and 1900.

Q. What part of the year did you commence?

A. As near as I recollect it was the beginning of August, the first week in August I think.

Q. Now how often did you take the samples?

A. Sometimes once every week and other times, there was once during the winter I took them three times a week,
4775 during the winter of 1900, I believe it was.

Q. Did these bottles have cork stoppers?

A. They had glass stoppers.

Q. And after you had collected the samples you sealed the bottle?

A. I sealed the bottle, yes sir, as soon as I took the sample.

Q. Do you know whether or not those bottles had been sterilized before you received them?

A. I don't know anything about that; they were sent to me, and that's all I know.

Q. Now in taking these samples, you pulled the cork out or stopper out before you put the bottle in the water?

A. Well sometimes, and sometimes not; there was times that I put it in the water and there was times, too, in the winter that the moisture of the air would freeze the cork so you had to take them out before you put them under water, otherwise I couldn't take them out at all.

Q. Now did you remove the corks after you got out on the river in the boat or before you went out?

A. I removed the corks after I got out in the boat.

Q. Now when did you cork them?

A. As soon as I got them out of the river I put the cork right on; as soon as I got them out I put the cork on, as soon as I possibly could.

4776 Q. Now after you had sealed the bottles, what did you do with them?

A. Packed them in ice and expressed them to the different departments as I said before.

Q. That's all you did with them?

A. That's all I had to do was to get them, pack them in ice and forward them to the different departments; that's all I had to do with them.

Q. You put the bottles in a box and then ice around them?

A. Well, there was two different ways, there was a small bottle which I put in a larger vessel, and packed with ice, then I packed ice in an outside can as much as I could pack in; the large bottle I simply put in there; there was no ice used.

Q. What was the size of the small bottles?

A. I believe it was supposed to be a four ounce bottle, I think.

Q. What was the size of the large bottles?

A. It was supposed to be a gallon bottle; that's what is marked on the card; of course I don't know what they are.

Q. How often did you collect samples in 1900?

A. Once a week. No, in 1900, there was sometimes once a week and sometimes three times a week as near as I can recollect. 4777

Q. Now you collected them in the same manner?

A. In the same manner.

Q. And made the same disposition of them?

A. Yes sir.

Q. As those that were collected in 1899?

A. Yes sir.

RE-DIRECT EXAMINATION, By Mr. Todd.

Q. You attached a tag to the bottles when you sealed them?

A. Yes I made out a certificate of shipment; of course I don't remember now what it was; whatever the certificate says.

AUGUST JOHNSON.

4778 Monday, July 13, 1903.

HENRY ATKINS,

(Mitchell's Point on Mississippi River.)

called as a witness in behalf of the defendants, being first duly sworn by the commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Henry Atkins.

Q. Where do you live, Mr. Atkins?

A. Mitchell, Postoffice, Illinois.

Q. How far do you live from the Mississippi River?

A. About 150 yards I guess.

Q. Mr. Atkins were you employed by the Sanitary District of Chicago to take samples of water from the Mississippi and Missouri Rivers?

A. Not of the Missouri, but of the Mississippi.

Q. At what point?

A. Chain of Rocks, down there.

Q. When were you first employed?

A. May 25, 1900— or 1899.

Q. And when did you cease to take samples of water?

A. October 4th, 1900.

Q. Have you taken any samples since October 4, 1900?

A. No sir.

4779 Q. For whom did you take this water?

A. Chicago Sanitary District.

Q. I will ask you to look at a card, sample number 2528, and ask you if, upon that card, the instructions printed on the back are the instructions which you followed in the taking of water?

A. I took the samples the same as those people told me to take them at the time.

Q. Well, the instructions on the back?

A. That's the way I filled the bottles.

Q. And is that in your handwriting, the card?

A. Yes sir.

Q. After you had taken the water from the Mississippi river, what did you do with it?

A. Took it over to Mitchell's and shipped to Chicago.

Q. Did you seal it?

A. Sealed it up first and put the tags on and shipped it up to Chicago and Urbana. I shipped one to Palmer, one to Prof. Jordan and one to the Sanitary District.

Q. On the tags that you sent attached to each sample, did you place the sample number upon it?

A. Yes sir.

Q. The time that it was taken?

A. Yes sir.

Q. Your name as the Collector?

4780 A. Yes sir.

Q. The height of the water?

A. Yes sir.

Q. The temperature of the water?

A. Yes sir.

Q. Direction of the wind?

A. Yes sir.

Q. Temperature of the air?

A. Yes sir.

Q. The absence of or occurrence of rains?

A. Yes sir.

Q. I will show you a tag for sample No. 2,528 and ask you if that was the same kind of a tag with its proper notation that were placed on each one of the samples which you collected and sent to Prof. Jordan of the Chicago University, Prof. Palmer of the University of Illinois at Urbana and the Health Department of the City of Chicago?

A. This is the same kind.

Q. With the proper notations?

A. Yes sir.

Q. What parts of the river did you take the water from?

A. First at 400 feet off the Missouri shore, the first sample; the second sample was at the tower, in the tower, and the third sample was in the main channel; fourth sample 400

4781 feet off the Illinois shore.

Q. Were these samples all taken the same day? Or at the same time?

A. You mean each sample taken the same day?

Q. Yes, cross-section?

A. Yes, all taken the same day.

Q. How often did you take these samples when you first began?

A. Once a week when I first began.

Q. When did you begin to take them oftener than once a week?

A. July, 1900.

Q. How often did you take them then?

A. Three times a week then.

Q. How long did this continue, three times a week?

A. A little over three months up to the 4th day of October.

Q. Did you take any samples after that?

A. No sir.

Q. Where did you get the bottles from that you took the samples in?

A. Mitchell, Illinois; they were shipped from Chicago and Urbana down to Mitchell.

Q. To you?

A. Yes sir.

4782 Q. What kind of bottles were these?

A. Some were gallon bottles and some were half-pint bottles.

Q. What kind of stoppers did you have?

A. Glass stoppers.

Q. Were the stoppers in the bottles when you got them?

A. Yes sir, unless I would find one broken.

Q. When would you remove the stoppers.

A. When I would fill the bottle with water, rinse it out and then refill it.

Q. How would you fill the bottle?

A. Take and remove the stopper and stick them down in the water and rinse them and observe the instructions they told me to, and fill them up again and set them back in their places.

Q. After the bottles were filled and the stoppers replaced, what did you do with the bottles?

A. Put the seal on them.

Q. Where were you when you put the seal on, on the river or on the shore?

A. Sometimes I put them on in the river and sometimes on the shore.

Q. After you placed the seal on the bottle did you attach the tag?

A. I put the tag on them.

Q. And each tag contains the notations that you have 4783 testified to in your previous answers?

A. Yes sir.

Q. After the bottles were sealed and tagged, what did you do with the bottles?

A. Took them over to Mitchell and shipped them by express to the places,—Urbana and Chicago.

Q. How did you prepare them for shipment?

A. Put them in their cases and had boxes with stuff around them packed them up in the boxes, so they wouldn't break, and the bacterial bottles, the small bottles I packed them in ice; that was my instructions.

Q. After you had packed the small bottles in ice, and the large bottles in excelsior, where did you take them to be shipped to Chicago?

A. Took them over to Mitchell station.

Q. By what express company did you ship them to Chicago?

A. Went by the Pacific; the other one, I don't know what it was, sometimes they went by the C. & A., which is the American, I believe, but the Pacific, most of them. The Wabash took some of them.

Q. You shipped them by one or the other of the express companies?

A. Yes sir.

4784 Q. I show you a bunch of tags and ask if they are in your handwriting?

A. That's my handwriting.

Q. They all have "H. Atkins" on them, is that your name?

A. That's my handwriting, yes sir.

MR. TODD: Mr. Commissioner, I will ask to have tag sample No. 2,528 marked Sanitary District of Chicago's Exhibit No. 2 for identification.

Said card so marked by the Commissioner.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. Mr. Atkins, where were you living at the time these samples were collected?

A. At the same place I live now, Chouteau Island.

Q. How far is that from the Chain of Rocks?

A. About a mile and half I should judge.

Q. What time of the day was it that you collected the samples?

A. I collected some in the morning, that is the first I collected, I collected in the morning, before dinner.

Q. Did you collect any in the afternoon?

A. Yes sir, generally about 2:00 p. m.

Q. How soon after you collected them before you shipped them?

4785 A. Before I got them over to Mitchell you mean?

Q. Yes.

A. Oh, it would be about four hours before I would get over there with them.

Q. Occasionally miss a train and hold them over until the next day?

A. Never held them over that I know of.

Q. In not one single instance?

A. There might have been one time; that's all I know. On special collection, Dr. Palmer was down there at one time, and we missed. Missed one time when this man from Urbana was here.

Q. You can remember no other time?

A. Two times is all I recollect on account of special collections.

Q. How about on the regular collections?

A. Didn't miss any time.

Q. That is you don't remember that you did?

A. No sir, I don't remember; there is only the two times that I recollect.

Q. Where did you get these bottles that you used in your collections?

A. Up at Mitchell, Illinois.

Q. Who did you get them from there?

A. They come from Chicago and Urbana; they shipped them there.

4786 Q. Were they shipped every day?

A. No sir.

Q. How often were they shipped?

A. Once a week up to July, 1900.

Q. Shipped direct to you?

A. Shipped to Mitchell, Illinois, to me, yes sir.

Q. Where did you keep them?

A. I went over and got them that day and filled them that same day; I came over in the morning and got the bottles and filled them the same evening and brought them back. On the first collection, once a week.

Q. How about those where you collected three times a week.

A. Well, I got them—always had sample bottles on hand all the time; took the bottles over and brung another set back with me.

Q. They shipped one set at a time, did they to you?

A. When three times a week they had lots of bottles down here then; they had three or four sets always; couple of sets on hand. There would always be a box at the depot waiting for me and I would get the set when I would go over there.

Q. Now what I want to know did you keep those extra sets at your house or did you leave them at the depot?

A. Sometimes over at the depot and sometimes I had some at the house.

4787 Q. Were the glass stoppers in them when you got them?

A. Yes sir.

Q. Did anybody besides yourself have access to them?

A. No sir.

Q. Where did you keep them?

A. In my house there, in a room.

Q. Did you keep them under lock and key?

A. No sir.

Q. Then anybody could have access to them if they had been there?

A. Yes, they could, if they wanted to; I mean when I was filling the bottles, is what I had reference to.

Q. Do know whether those stoppers were removed while you had them there in your house?

A. Why nobody bothered them that I know of.

Q. Now after you went out in the river to collect these samples, you took two kinds of bottles, didn't you?

A. Yes, large bottle and small bottle; gallon bottle and a half pint bottle.

Q. Did you always take the sample at the same place?

A. As near as I could; couldn't always get steady.

Q. You say you rinsed the bottles?

A. Yes sir; that was my instructions, to rinse them out.

4788 Q. Did you rinse both the large and small bottles?

A. Yes sir.

Q. In order to rinse the bottle, how deep under the surface of the water did you go?

A. About that deep I would hold my hand down (indicating).

Q. About how many inches?

A. About four or five possibly.

Q. Then after the water got into the bottle you would take it out and rinse it?

A. Yes sir.

Q. Then what would you do?

A. Put it back under the water again and fill it.

Q. Where was the bottle when the cork was first taken out of the bottle?

A. Why, I had my hands above the water.

Q. And you put the cork back in the bottle to rinse it?

A. No, I took and rinsed it out and put it down again and took it up and put the stopper in it; they wouldn't allow me to hold the stopper in my hand at all; they made me keep it away from the bottle; not touch the stopper.

Q. In other words, they didn't want you to put the fleshy part of your hand against that part of the stopper that goes into the bottle?

A. Yes sir, that's it.

4789 Q. How deep under the surface of the water did you hold the bottle when you collected the sample that you shipped?

A. Five or six inches, something like that; about that deep down (indicating).

Q. Did you ever collect any with a machine of any kind?

A. No; I made a patent of my own there towards the last; I made a wooden holder and held the bottle in that.

Q. You say you only collected once a week or three times a week?

A. Once a week up to July, 1900; oh, I missed some collections; I couldn't collect every time. I missed sometimes when the river was froze over or ice running.

Q. Now from July, 1900, you collected three samples?

A. After July, 1900, I collected three samples, three times each week.

Q. Three times each week?

A. Three times each week.

HENRY ATKINS.

4790 Alton, Illinois, July 13, 1903.

F. M. CALHOUN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. You may state your name, occupation and place of residence?

A. F. M. Calhoun, fisherman, place of residence, city of Alton, State of Illinois.

Q. Were you ever in the employ of the State of Illinois, in taking samples of water, and if so when and at what place?

A. Yes sir. I have been employed by the State Board of Health, in taking samples out of the Illinois river at its mouth, and the Mississippi also.

Q. At what place?

A. Above Grafton.

Q. On what river?

A. The Illinois river, about two miles above Grafton, and the Mississippi river samples was gathered about a half a mile above the town, across on the other side of the channel of the Mississippi.

Q. Were the samples taken in the Mississippi river, taken above or below the mouth of the Illinois river?

4791 A. It was taken above the mouth of the Illinois; that is, it was taken from where the Illinois water couldn't possibly reach the Mississippi water at that place. When it was high, so there was some show of it mixing, why I would go further up.

Q. How many samples did you take each time in the Illinois river?

A. I would take two.

Q. At what points in the Illinois River?

A. About two miles above Grafton, or, well, I will explain it a little plainer. It was in case the Mississippi were higher than the Illinois, I would have to go higher than a certain point. Of course I aimed to get the water clear all the time—the two waters being unmixed, is what I have reference to.

Q. How many bottles and what kinds or sizes did you use each time that you took a sample?

A. Well, I couldn't exactly say. The large sample was a gallon bottle, and I think the small sample was about a four ounce bottle.

Q. Did you use these two sizes of bottles for samples of both the Illinois and Mississippi river water?

A. Yes sir.

4792 Q. State as nearly as you can when you commenced taking samples in each river and how long you continued taking them each time and how many times a week you took them?

A. Well sir, that would be hard for me to tell. I think that I could tell positively. I have a memorandum of it, I think of all of it.

Q. Give your best recollection as to the time when you commenced, and in order to refresh your recollection I hand you a bundle of tickets, which you may examine?

A. Yes sir. I recognize the tickets. 1899, July the 17th. Of course they refresh my memory so I think it was about that time I commenced.

Q. I will ask you to examine the last one of the bundle of tickets and state whether the date upon that is about the time you closed the first taking of water?

A. Well, I could say this. I recognize taking that, but whether that was the last I couldn't tell. I could tell on my book exact.

Q. Do you remember whether you took samples in the early fall of the year 1899?

A. Yes sir.

Q. Do you remember whether you took samples also in the year 1900?

A. Yes sir.

Q. At what time in the year?

4793 A. As for remembering it; I didn't try. I kept an account of it on the book; I didn't try to keep it in my mind.

Q. Examine the tickets which I now hand you, numbered 318 and dated February 15th, 1900, and state whether or not that is a ticket made by you?

A. Yes sir, I recognize my signature on it.

Q. Did you commence taking samples about that time 1900?

A. Yes sir, I remember commencing about that time.

Q. Examine the ticket I now hand you marked in the corner 616 and dated September 24th, 1900, and state whether or not that is also in your handwriting?

A. Yes sir, that is the ticket.

Q. Do you remember whether that was the last of the samples you took in 1900?

A. I couldn't say, but from what I wrote on there, it must have been.

Q. During the period covered by these tickets, did you take samples of water in each river, the Illinois and the Mississippi?

A. Not all the time. I would take the Illinois water by itself sometimes, just one sample, and not the Mississippi.

Q. How frequently during the time that you took samples did you take them? That is how many times a week or a day? 4794

A. Why, sometimes, I would take them once a week, and it varied from that to five times a week.

Q. Describe particularly the manner in which you took the samples?

A. I took them according to the directions on those cards as near as I could.

Q. Did you use any machinery to take it?

A. No sir.

Q. Always by hand?

A. Yes sir.

Q. After the bottles were filled, describe particularly what you did to each of them, each sample?

A. I sealed them according to those directions, very particular, and stamped them with the number I had; I had a stamp with a number on it. It was No. 12 upside-down, is what my stamp was, so it was just as good as if it had been right side up. I have the stamp yet in my possession; I can produce it.

Q. To whom did you send these samples?

A. Mr. J. H. Long, Chicago.

Q. By what means?

A. By express.

4795 Q. How soon after they were taken?

A. Just as soon as convenient to ship them, as near as I could.

Q. How soon after the taking were they shipped?

A. Well, it would vary from an hour, an hour and a half to the time they would be shipped.

Q. How were the smaller bottles packed?

A. Packed in a small can with cotton around it; the can sealed, put in a large can and ice packed around the smaller can.

Q. How was the larger bottle packed?

A. The larger bottle was packed in a box with excelsior around it, and the glass stoppers was tied up tight and sealed.

Q. What did you put upon the bottle? Did you put any tag or card upon the bottle?

A. Yes sir.

Q. Describe it?

A. It was the tag like those, put in an envelope, sealed and directed to Mr. Long, and tied on the neck of the large bottle; that's where I alwys tied the tag.

Q. Was there any tag put upon the smaller bottles?

A. No sir.

Q. Now in what did you put in these envelopes?

4796 A. One of those blanks filled out.

Q. I hand you an envelope for identification, upon which I have put in pencil the letters "J. H. L.," and ask you to state whether that envelope is similar to the ones used by you?

A. Yes sir. That's the same envelope I always used.

Q. The same kind?

A. Yes sir.

Q. Exactly?

A. Yes sir.

Q. Now did you put in such an envelope a card or letter similar to the one which I hand you which is marked 315?

A. Yes sir.

Q. And was the envelope then sealed?

A. Yes sir.

Q. I hand you now for identification a bundle of such cards, together with three pieces—or rather four pieces of white paper and ask you to state whether the writing upon those and each of them, is yours?

A. Yes sir, I am satisfied all those cards I have seen before.

Q. Are those the cards which you put into the envelopes and forwarded to Prof. Long?

A. Yes sir.

4797 Q. And the envelopes in which these were enclosed were attached to the bottles in each instance?

A. Yes sir.

Q. Now I hand you another bundle of cards and you may state whether or not they are in your handwriting.

A. Yes sir.

JUDGE JOHNS: Mr. Commissioner, I will ask you to mark this "Exhibit No. 1 for the State of Illinois, for identification." (Cards enclosed in an envelope, sealed and marked by the Commissioner as requested).

Q. Now were these cards which I now hand the Commissioner and ask him to mark "Exhibit No. 2 for the State of Illinois for identification," all made by you? (Cards enclosed in an envelope, sealed and so marked by the Commissioner).

A. Yes sir.

Q. And were they each put in an envelope and attached to a bottle?

A. Yes sir.

Q. I hand you now a third bundle of cards and ask you to state whether or not those cards are in your handwriting?

A. Yes sir.

Q. Did you take samples of water during the time covered by the dates upon these cards?

A. Yes sir.

Q. I now hand the Commissioner a third bundle of cards and ask him to mark them "Exhibit No. 3 for the State of Illinois, for identification," and ask the witness to state 4798 whether they are all in his handwriting? (Cards enclosed in an envelope, sealed and marked by the Commissioner as requested.)

A. Yes sir.

Q. Were those cards put in envelopes which were attached to bottles containing samples of water?

A. Yes sir.

Q. Did you take samples of water at three different periods, commencing in 1899 and ending in 1901? I mean by that at three different times?

A. Yes sir. I took that many.

Q. How long have you lived at Grafton?

A. I lived there ten years and a few months.

Q. Did you live in the village?

A. Yes sir.

Q. What was your business during that time?

A. Fishing.

Q. By what means, nets or lines?

A. Nets.

Q. Was that your regular occupation?

A. Yes sir.

Q. For how many years prior to the 17th day of January, 1900, did you pursue the business of fishing in the Illinois river?

A. Some every year for eight years.

4799 Q. Did you during those years engage in putting up ice, or assist anyone in putting up ice?

A. Yes sir.

Q. For how many years?

A. Prior to 1900 do you mean?

Q. Yes, prior to 1900?

A. Every year that the ice was fit to put up during that time. There was some years during that time we had no ice fit to put up.

Q. What do you mean by "fit?"

A. It didn't get heavy enough; thick enough.

Q. Did you engage in fishing after January, 1900? And if so for how long a time at Grafton, in the Illinois river?

A. For two years.

Q. Were you aware of the opening of the drainage canal?

A. Yes sir.

Q. What was the condition of the water in the Illinois river before the opening of the drainage canal, as a general thing?

A. Take this time of year, low water, it was very stagnant, down, twelve or fourteen miles, where I was used to going, and not a very good current in it and therefore it was in bad shape. Of course in cold weather it was—the water 4800 was in better condition, of course. After the canal was opened, why it never got so stagnant, as it did heretofore. We had more or less current all the time. Of course it would take some time to explain what I mean.

Q. Go on; that's what we want to know.

A. We could fish it different before you turned it in, than we could afterwards, because the current interfered in part of our way of fishing. Of course we all consider it was better by having a good current.

MR. JEFFRIES: We object to what the witness says as to what they all considered and move that it be stricken out.

Q. JUDGE JOHNS: Go on. Mr. Calhoun?

A. Why I don't know as I have anything more to say.

Q. At which time was the water clearer?

A. Well, after we would get settled weather, without raises, after the canal was turned in, it woud get very clear, different from what it used to be before it was turned in; it would depend upon the rainy weather and raises and falls. Before it was turned in, why take it when it got low, there would be a green scum form over it, and you couldn't tell whether it was very clear or not; with the current we had but very little of that afterwards.

Q. Did you use the water for drinking purposes?

A. Yes sir, part of the time.

4801 Q. Do you know whether the fishermen living upon the river in your vicinity use the water of the Illinois river for drinking purposes?

MR. JEFFRIES: Objected to as incompetent, irrevelant and immaterial, as not tending to prove any issue in this case and not competent of this witness.

A. Yes sir.

Q. At which time was it best for drinking purposes?

MR. JEFFRIES: We object to the question for the reason that the witness is not qualified as being capable of testifying from a sanitary standpoint as to whether the water was suitable for drinking purposes at any time.

A. Well it was better in cold weather, of course.

Q. With reference to the opening of the drainage canal, was it—which was the better condition for drinking purposes?

A. Well of course twice a year it was just as good as any time, but of course it wasn't so good before the Canal was turned in, when that green scum was on it. Of course we overcome that some when we was compelled to drink it during that time by sinking a jug down under the surface of the water and got it in that way.

Q. Is it your opinion that it was better for drinking purposes after the canal was opened?

4802 MR. JEFFRIES: We object to the question for the reason that the witness is not qualified as an expert on the sanitary condition of the water, nor as an epidemiologist, and for the further reason that any opinion that the witness himself might have, would be irrelevant and incompetent and without weight.

A. I couldn't say as to that; we drank it before and afterwards just the same.

Q. With reference to the ice which you put up and assisted in putting up, at which time was it clearer, before or after the opening of the drainage canal?

A. Well, that is a question hard to answer. It would depend on the condition the river was in, when she froze up and the ice was made. Of course it is hard to answer on that account. It might have froze up muddy afterwards, when the canal was turned in, it would be bad looking ice, and it might have done that before; I couldn't say.

Q. As a general rule, at which period was the ice more clear, before or after the opening of the drainage canal?

A. I couldn't say.

Q. Was there at any time before or after the opening of the drainage canal a disagreeable odor in the water at Grafton?

A. No sir, not any more than it always had, that I could say.

4803 Q. When the river was frozen over, was there a disagreeable odor in the water under the ice, either before or after the opening of the drainage canal?

A. No sir; I didn't see no difference.

Q. Are there ice houses at Grafton in which you assisted in putting up ice?

A. Yes sir.

Q. Both before and after the opening of the canal?

A. Yes sir.

Q. Did you ever have occasion to examine the draining, or drains from the ice houses?

A. Yes sir, some.

Q. Could you tell whether there was any odor from the drains or water running from the ice houses?

A. Why there is more or less of an order from an ice house at any time as near as I can tell; I have examined them of course.

Q. Could you tell any difference in the odor, whether there was a greater odor after the opening of the canal?

A. No sir.

Q. Than before?

A. No sir.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Where did you get the bottles that you used in taking these samples of water?

4804 A. They were shipped to me from Chicago.

Q. Do you know who shipped them?

A. Yes sir, I think I do.

Q. Who was it?

A. Mr. J. H. Long.

Q. How many did he ship at a time?

A. Well, they varied; they come sometimes two of them, and I think as high as 20 of them; it varied between that.

Q. They were shipped direct to you?

A. Yes sir.

Q. What did you do with them?

A. I taken care of them and used them as I was ordered to do.

Q. Took care of them in what way; where did you keep them?

A. I kept them locked up in a small building that I had.

Q. Nobody else got in there?

A. No sir.

Q. Now when you went out in the river to take these samples, you first rinsed the bottle before you took the sample, did you?

A. No sir.

Q. Did you use some kind of an instrument in getting them?

A. No sir.

Q. Now state how it was done?

A. Well, I would take the bottle in the left hand and a hold of the stopper with this hand, put it under the water and
take the stopper out; when the bottle filled, I put the stop-
4805 per back again.

Q. How deep under the surface of the water did you get the bottle?

A. I suppose they got about a foot under the water is about as far as I could get them.

Q. And you took it up, corked it, sealed it, packed it and shipped it?

A. Yes sir.

Q. What time of the day would you generally take the sample?

A. Along about four o'clock in the afternoon.

Q. You would start out and get the sample in the Illinois river, then you would carry those samples along with you to the Mississippi river and then you would take all those samples and bring them back and ship them?

A. Yes sir.

Q. Now how long would that take you?

A. You mean the whole trip from the time I would start?

Q. Yes.

A. It would depend on the wind I had to pull against.

Q. Well about how long, approximate it, about how was the average?

A. About two hours.

4806 Q. Then after you packed them you put them right on the train and expressed them through?

A. Yes sir.

Q. How many times did you miss getting the samples on the train the day that you intended to get them on?

A. I don't remember of ever making a failure.

Q. You say, I understood you to say that about the only difference in the water of the Illinois river before and after the opening of the canal so far as appearance is concerned, is that prior to the opening there was a green scum on the water in places while that is not true now; there is no scum now?

A. No sir, the current keeps it carried off.

Q. Well that is your testimony that that was the only difference in the water so far as appearance was concerned?

A. Yes sir, about the only difference.

Q. Now this green scum never forms on running water does it?

A. No sir, not like we have on dead water.

Q. So that the real difference is that there is a running current now when before at times, there was no current?

A. Yes sir.

Q. Since the opening of the canal has the water in the Illinois river ever got so low that there was no current?

A. No sir, but then that don't always make the dead water.

4807 We had a sixty mile current up the other way this year. She was dead the other way. It depends on the Mississippi, or controls it to a certain extent, but it doesn't control it now so much as it used to.

Q. You are speaking now of the back water from the Mississippi river, aren't you?

A. Yes sir.

Q. Now if the back water from the Mississippi stood in the Illinois river long enough, a green scum would form would it not?

A. Yes sir, likely it would, in hot weather.

Q. How far up the Illinois river have you been?

A. Above Hardin a little ways, about twenty-two or three miles further up the river.

Q. Then you don't know of your personal knowledge that there was 60 miles of back water?

A. Well, of course there is lot of things we don't know. Steamboat people on the Bald Eagle told me personally it backed up sixty miles.

Q. But you don't know it personally?

A. No sir.

Q. You are not acquainted with the Illinois river then above its mouth very far?

A. No sir, I am not.

4808 Q. Well, did that green scum form on the waters of the Illinois river when there was no back water from the Mississippi?

A. No sir.

Q. Neither before or after the opening of the canal?

A. No sir.

Q. You say it did not?

A. Yes sir, I said it did not.

Q. Do you know whether or not the rains have any effect on the appearance of the water with reference to its being clear?

A. Why, if it rained too much, made it muddy, it wouldn't be clear. If the rain was far enough up that the muddy water would settle before it got down to where I was, it would cause a current and wash the scum off.

Q. What's your idea of a drinking water?

A. What do you mean?

Q. Why a water suitable for drinking purposes, clear water?

A. Why, good clear, pure water.

Q. Any water that was clear and cool, you would pronounce good drinking water, wouldn't you?

A. If it had no stench to it.

Q. And that's your idea of water when you say you have been drinking the Illinois river water, that is you drink it because it is clear?

A. Yes, sir; because I think it is about as good as any, about as good as well water.

4809 Q. Well, do you drink it at any and all times of the year now?

A. Yes, sir.

Q. Regardless of its appearance?

A. Yes, sir.

Q. Well, it isn't always clear now?

A. No.

Q. There is much more of a current now as I understood you, than there was prior to the opening of the canal?

A. Yes, sir.

Q. About how much more of a current?

A. Well, there is considerable more. It is hard to answer that question that way.

Q. Do you know whether or not that current is caused by an increased flow of water from the Sangamon river or from other rivers?

A. Well,—

Q. Or do you know what causes it?

A. Yes, sir; I think I do.

Q. Well, what is it?

A. Why, I think it is caused from the canal, a certain amount of it.

Q. What canal?

A. The Chicago Drainage Canal; if you want to know why I know it, I can explain to you why I think I know it.

4810 Q. You can explain it to us if you want to?

A. Why, if it was caused by rains; it would be muddy, more rilier, muddier—not so clear.

Q. Then I understand you to say that the volume of wa coming down the Illinois river now at all times of the year is far in excess of what it previously was or was prior to the opening of the canal?

A. Yes, sir.

Q. Now, there is no back water in the mouth of the Illinois river except when the Mississippi river is high, is that true?

A. Yes, sir.

Q. At ordinary stages it runs out regularly and down the Mississippi?

A. Yes, sir.

Q. A distinct rapid current?

A. Yes, sir.

Q. Flowing out?

A. Yes, sir; a fair current.

Q. Fair current.

A. Yes, sir; it controls it more or less.

Q. Depending on the stage of the Mississippi river?

A. The Mississippi and Illinois.

Q. Now, this ice that you cut, how far up the Illinois river did you go to cut the ice? 4811

A. Why, we cut it right in the mouth of the river; it depends on what you call the mouth of the river there.

Q. In the channel of the river?

A. Not exactly, no.

Q. Was it from the back water from the Mississippi?

A. No, sir.

Q. Where was that ice disposed of or consumed?

A. In Grafton.

Q. How large a place is Grafton?

A. Why, I think its about six or seven hundred.

Q. How long have you been fishing?

A. Eleven years.

Q. Right there at Grafton?

A. No, sir; I spent a year here.

F. M. CALHOUN.

4812 Alton, Illinois, July 13th, 1903.

GUST BAILEY, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. You may state your name, residence and occupation?

A. Well, my occupation at present is fisherman except when I was collecting water; I am what you might call a day laborer.

Q. Residence?

A. East Alton.

Q. Were you ever engaged in taking samples of water for the State of Illinois?

A. Yes, sir.

Q. Do you remember when you commenced and when you finished?

A. Not exactly; I have got a record of it all, but I lost it in this high water.

Q. Were you engaged in taking samples of water more than one season?

A. Yes, sir; I commenced in the fall at first, and the next spring I collected eight samples, and then they stopped.

Q. In what year did you commence?

A. Well, I disremember by year, but I had a record of it, I depended on that. It would show on my cards if you
4813 have them there.

Q. I hand you some cards, one of which is numbered 644 and dated October 10th, 1901, and ask you to examine them and state whether or not the cards are in your handwriting?

A. Yes, sir, it is.

Q. Examine all of them and state whether they are all in your handwriting?

A. Yes, sir.

JUDGE JOHNS: I now hand the Commissioner the cards examined by the witness and ask that they be placed in an envelope and marked Exhibit 4 for the State of Illinois, for identification.

(Cards inclosed and marked by the Commissioner, as requested.)

Q. Where did you take the samples of water?

A. At the mouth of the Missouri, about 100 yards above the dividing waters.

Q. Of what rivers?

A. The Missouri river and the Mississippi.

Q. Were they taken with reference to getting the water of the Mississippi or the Missouri river?

A. Missouri river water is the water I collected.

Q. How frequently did you take samples during the time you were engaged in that business?

A. The first week I taken it three times a week, and along towards the last they put me to four—four collections a week, or it could have been five; I am not positive.

4814 Q. At how many points in the Missouri river, did you take samples each day—each time?

A. About the same point as near as I could hit it.

Q. Where was that point?

A. It was right across the Mississippi from where I lived, at what they call the Mobile Island, it is called the Mobile Island at the mouth.

Q. Where was this point with reference to the current of the Missouri river?

A. Why, I collected the water in the channel in the main current, or at least where the boats ran.

Q. Describe particularly the manner in which you took the samples each time, and the kind of bottle in which it was?

A. I took it in the way I was directed on the card, as strictly as I possibly could.

Q. How many bottles did you have each time?

A. Two. One bottle contained about a gallon of water, and the smaller one about a pint or half a pint.

Q. At what depth did you take the sample?

A. About a foot below the surface of the water.

Q. When the bottles were filled, what did you do with them?

4815 A. I attached the stoppers in as directed and lifted them out of the water.

Q. Did you then place any mark or any tag upon the bottle?

A. Yes, sir; after I sealed them.

Q. How did you seal the bottles?

A. With sealing wax; I placed a rubber cloth over; wrapped the neck well with a rubber string, and put the seal on top of the bottle, placed the little bottle in a can packed with cotton; I also sealed this little can in three places. I took the large bottle, wrapped it also, tied it with a string, wrapped the string forked over the top of the bottle and sealed the string fast to the top. That held the tag.

Q. Did you have any number upon your seal?

A. Yes, sir; J. H. Long, that was all the mark that was on my seal.

Q. Did you also take the temperature of the water?

A. Yes, sir; as you will find there on the cards. And of the air also; stormy or calm; raises or falls.

Q. In the river?

A. In the river. Or standing.

Q. Did you place upon these cards these various items correctly each time?

A. Yes, sir.

4816 Q. And as they are now do they correctly state the temperature of the air and water?

A. Yes, sir; according to thermometer that they gave me.

Q. When you had written upon the card what did you do with it?

A. I placed it in this envelope sealed to the bottle and sealed the tag up—the envelope I called them.

Q. I hand you now an envelope marked John H. Long, on which I have placed in pencil, the initials, "J. H. L." and ask you to state whether or not the envelopes which you used were exactly similar to that?

A. Mine was not cut open, this was left open and I put the tag inside there and sealed it.

Q. After the card was placed in the envelope and sealed, what did you do with the envelope?

A. Why it was simply fastened on the large bottle before I placed the card in the envelope. Sealed fast, understand. Tied and sealed.

Q. Was the string which tied the envelope to the bottle also sealed?

A. Yes, sir; fast to the bottle.

Q. After the bottles had been sealed, what did you do with them?

A. I placed the little bottle in this can as I stated, before, in the cotton, the can of cotton. I placed this can in another can, and packed around it with cracked ice. This 4817 can was sealed in three places. I placed the larger bottles inside of a box in excelsior; we packed it well. That's the bottle that this card was on.

Q. Then what did you do with the box?

A. I carried it to the Adams Express office, in Alton.

Q. How long a time from the time you took the samples until the box that the sample was in—

A. Reached the express office?

Q. Yes, arrived at the express office?

A. Oh, about two hours.

Q. To whom was the box addressed?

A. J. H. Long, Chicago.

Q. Was the course of business in taking each sample the same as you have described?

A. Each sample, you mean, collected the same way?

Q. Yes.

A. Yes, sir.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long did you engage or were you engaged in collecting these samples?

A. Well, sir, as I stated before, I couldn't call it to memory, but it was from the time I commenced until just a while before Christmas. 4818

Q. You say you collected from three to five samples a week?

A. Yes, sir; it might not have been only four. The dates will show on my cards.

Q. Did you collect the same number each week?

A. No, sir; I collected only three collections the first three weeks and then they added another collection on to that, I forget.

Q. You simply collected them as they ordered?

A. Yes, sir; I collected as they ordered.

Q. Did you rinse the bottles out?

A. No, sir; I just filled them as they was sent to me.

Q. Weren't you instructed to first rinse the bottles out before you filled them?

A. No, sir.

Q. Don't you know that the card on which your instructions were written, and which was attached by seal to each bottle, after the sample was taken, specified in the instructions to you, that the bottle should be first rinsed.

A. No, sir; I think they did that themselves, and for us not to meddle with them.

Q. Did you put the bottle under the water before you removed the stopper?

A. Yes, sir.

4819 Q. What kind of a machine or instrument did you use in gathering the samples?

A. My hands.

Q. How deep under the surface of the water did you go to take the samples?

A. About one foot, about to my elbow (indicating).

Q. You sent no samples to any other person than to J. H. Long?

A. No, sir.

Q. How long have you been a fisherman?

A. Been fishing three years this time.

GUST BAILEY.

Adjourned to the same place at nine a. m., July 14, 1903.

4820 Alton, Illinois, July 14, 1903. Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

GEORGE BROOKS, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. George Brooks.

Q. Where do you live?

A. I live in Alton.

Q. Mr. Brooks, did you collect water for the Sanitary District of Chicago?

A. I did.

Q. When did you begin the collection of water?

A. I didn't keep no dates, but the first I collected was, I commenced in November for the state, the University at Urbana.

4821 Q. What year was that?

A. I couldn't tell you what year it was. If you will let me make a statement I can show you what year it was.

Q. Did you take samples in 1899?

A. Yes, sir; according to that card I did.

Q. Did you take samples in 1900?

A. Yes, sir.

Q. Did you take any samples last year, 1901?

A. Last year, I don't think I did. I quit taking samples a year ago last October, I think it was, when I quit. I took a few samples after that for Prof. Reynolds; I believe I took four samples after that for Prof. Reynolds, after the Chicago people stopped; that was a year ago last October, I think. I didn't keep no dates at all; I guess the card shows the dates.

Q. Where did you take samples from?

A. I took them up here at the new waterworks, about a mile above Alton, except two or three times I couldn't get up there on account of the heavy ice; and then I took here at the old waterworks, I couldn't get up there with a skiff at that time; there was no way of getting them.

Q. What other place did you take water from?

A. I took water at Wood river, down here about six miles.

Q. Where else?

A. Took it down below the mouth of the Missouri; I was
4822 with Prof. Reynolds at that time right along, at the time
we took it below the mouth.

Q. Where else did you take them?

A. No other place.

Q. Then you took it in three places?

A. You mean down there and up here?

Q. Yes.

A. Yes, sir; but that wasn't regular you know, but whenever Prof. Reynolds would come in here and want me to go I would go with him, but one time he sent in here and I went down there another man and myself, and we took water for him.

Q. Where was it that you took regularly?

A. Up here at the new waterworks; that was my regular place.

Q. When you took water down below Alton, that was special takings?

A. That was special, yes.

Q. How many samples of water would you take across the river at one time?

A. I took water in five different places in crossing the river.

Q. For how long a period did you take it?

A. I commenced in November taking regular and I kept
that up—that was for the state alone; that was kept up
4823 until last June. I took five bottles in five different places
in crossing the river. Well, then, the next June I received

these boxes from Chicago, two sets of boxes from there and one from Urbana, and I took them until the next June would be one year, and then the following October, that would be about eighteen months that I took water for Chicago and the State combined.

Q. *In taking water, just describe how you took it; what* you took it in?

A. I used to go up to the waterworks and I would go out as near as I could calculate 100 feet from the shore and anchor; then I had a rigging that I put this bottle in and fastened it in there and then I would sink it down about a foot under water, and take the water, and then I would put that bottle away, and then I would go one-fourth of the distance as near as I could calculate and do the same thing, and then I would go to the center of the river and do the same thing; and then one-fourth the distance from the other shore, and then I would go 100 feet from the other shore and take the last sample; that was my instructions.

Q. What kind of an affair was this rigging that you speak of?

A. It was a piece of board with a little box right down at the bottom of it, and this piece of board was about five or six feet long; this little box was big enough to receive the bottle would fit in there nicely, and then I would tie a string 4824 around the neck of it and then I could plunge it right down under the water and take it that way. I done that in cold weather you know; I couldn't stand it to hold it with my hands in the ice water, was the trouble. It was all right in warm weather, but this rigging, I could use it any time.

Q. Now after you took the water, what did you do with it?

A. I brought it down here and fixed it for shipping, and labeled it.

Q. The bottles that you took the water in, where did you get them from?

A. Why, the express company delivered them to me.

Q. And who sent them to you by express?

A. Chicago and the State.

Q. By the state, do you mean the University of Illinois, Prof. Palmer?

A. Yes sir.

Q. When these bottles arrived, did they have glass stoppers in them.

A. Yes sir.

Q. When did you remove the glass stoppers?

A. Just at the time that I was going to submerge them under *the water.*

4825 Q. And when did you replace them?

A. Instantly as soon as the bottle was filled.

Q. And then, after collecting one series of samples on a given day, you brought the samples to shore?

A. Yes, sir.

Q. And sealed them?

A. Yes, sir.

Q. And placed the tag upon them?

A. Yes, sir; and the small bottles; I also had ice for the small bottles.

Q. Did you do this to all the samples that you collected?

A. I did, sir.

Q. I will show you a card which is sample No. 2222, and ask you if that was the kind of a tag that you placed on all the water samples which you collected?

A. Yes, sir.

Q. That tag is in your handwriting, is it not?

A. Yes, sir; it is.

Q. On these tags you marked the number of the samples, the date of taking?

A. Yes, sir.

Q. The place where the samples were taken?

A. Yes, sir.

Q. Your own name?

A. Yes, sir.

4826 Q. The height of water, temperature of water. direction of wind, temperature of air, and whether it rained or not, did you?

A. Yes sir.

Q. And these tags were placed on all the samples which you took?

A. Yes sir.

Q. Now after you had sealed and labeled the samples, how did you prepare them for shipment?

A. Why I packed them in what we called excelsior; I packed them in that as hard as they could be; and the small bottle of course which was in the can I had to put ice in there; I filled the can full around the bottle.

Q. How large was the big bottle and how large was the small bottle?

A. Well I don't know; them large bottles I think, looked like they might hold a gallon.

Q. And the small bottles?

A. Well the small bottles, they looked like they would hold a pint.

Q. The small bottle was packed in ice and the large bottle and small bottle were put in a box.

A. Yes sir.

4827 Q. To whom did you express these samples?

A. I expressed one sample to the City Hall, Chicago, and the other one to the University in Chicago, that is, one box, you know, and the other one went up here to Urbana, to the state.

Q. Do you know whether the box sent to the University of Illinois at Urbana, was sent to Prof Palmer?

A. Yes sir, it was.

Q. And the one to the University of Chicago to Prof Jordan?

A. Well, his name wasn't mentioned.

Q. And the other to the Health Department of the City of Chicago?

A. Yes sir.

Q. What express Companies did you send these three different samples by?

A. Well, it was United States Express.

Q. How long after they were collected and sealed and packed was it, before you sent them off by express?

A. Well, sometimes it might be two hours before they would go and sometimes it wouldn't be that long. If we could catch the early train in the evening, why they went sooner.

Q. You got them all off the day that you collected them, did you?

A. Yes sir.

4828 MR. TODD: Mr. Commissioner, I ask to have the tag, sample No. 2222, which has been exhibited and identified by this witness, marked "Sanitary District of Chicago's Exhibit No. 3 for identification."

Said card so marked by the Commissioner.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Where did you say you lived?

A. Alton.

Q. Over on the east side?

A. East side.

Q. How long have you lived in Alton?

A. I lived in Alton since 1874.

Q. What is your business or occupation?

A. Well I followed fishing about 15 years.

Q. What are you doing now?

A. Running a skiff ferry and building skiffs.

Q. What kind of an instrument was this that you used in collecting these samples of water?

A. It was a small box nailed onto a board about five foot long.

Q. You put the bottle in the box and submerged it?

A. Yes sir.

4829 Q. When did you pull the cork out?

A. Just before I submerged it; right at the top of the water.

Q. When did you put the cork in again?

A. Just as soon as possible after the bottle was raised out of the water.

Q. Where did you say you took these samples?

A. I gathered them in five different places in crossing the river.

Q. What river?

A. The Mississippi.

Q. Where?

A. Up here at the new waterworks, about a mile.

Q. You mean a mile above Alton?

A. Yes sir.

Q. You generally got the samples out on the train the same day that they were gathered?

A. Yes sir.

Q. How many times did you miss the train?

A. I don't recollect of missing it any time.

Q. You say it was about two hours after the samples were gathered until you got them to the express office ready for shipment?

A. Yes, generally about that time.

Q. Sometimes longer than that?

4830 A. It might have been; sometimes it was a little longer.

Q. You took two kinds of samples, didn't you, a small bottle and a large bottle?

A. Yes sir.

Q. Always packed both bottles in ice?

A. Not the big bottles I didn't; the little one that was in the can.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. On the back of these cards were the instructions?

A. Yes sir.

Q. Did you follow these instructions?

A. As near as I could.

GEORGE BROOKS.

4831 Alton, Illinois, July 14, 1903.

JAMES MATHEWS,

called as a witness in behalf of the defendants, being first duly sworn, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. James Mathews.

Q. Where do you live Mr. Mathews?

A. I live on Little's Island, just above the bridge.

Q. That is in the Missouri River?

A. Yes sir.

Q. Did you take samples of water for the Sanitary District and the State University of Illinois and the University of Chicago?

A. Yes sir.

Q. What years did you take the water?

A. 1899 and 1900, according to them cards, I must have run into 1901, but I didn't know it; I supposed it was over before I come to 1901, I didn't keep no dates.

Q. I show you a card to refresh your recollection No. 9746 and ask you if that is in your handwriting?

A. Yes sir.

4832 Q. And the date was put on there correctly by you, was it?

A. 1901, yes.

Q. Look through that bunch of cards and see if all the dates are not 1901, that you collected samples and made the cards?

A. Yes sir, they are all dated 1901 that I see here.

Q. When you first began to take water in 1899, where did you collect from?

A. Fort Bellefontaine bridge.

Q. And at what other points?

A. That's all the point.

Q. How many places?

A. One place, the main channel.

Q. Of what river?

A. The Missouri.

Q. Did you ever collect any water in any other river but the Missouri river?

A. No sir.

Q. Is that place where you collected water known as Fort Bellefontaine, or near there?

A. It's fort Bellefontaine on the other side, and West Alton on this side; I shipped from West Alton.

Q. West Alton is on the Missouri river?

A. Its the closest town on this side to the bridge, West Alton is.

4833 MR. JEFFRIES: That is you mean the bridge at Bellefontaine?

A. Yes sir.

Q. Mr. TODD: See if I understand you. You collected the water from the Missouri river between Fort Bellefontaine on one side of the river and at a point known as the bridge?

A. Yes sir.

Q. And shipped the water from West Alton?

A. Yes sir.

Q. What did you collect the water in?

A. I collected it in what is called three sample boxes; it was a large bottle and two small ones in each case.

Q. How often?

A. Once a week.

Q. During these periods that you collected water, did you collect it oftener than once a week at any time?

A. No sir, I never did, excepting a year ago last winter I collected six days and took it to St. Louis.

Q. Who were you collecting for then?

A. Prof. Palmer; there was a chemist in St. Louis used some of it and part went to Chicago.

Q. Where would you get the bottles from that you used?

A. They were shipped to West Alton, Missouri.

4834 Q. Did the bottles have stoppers in them?

A. Yes sir.

Q. What kind of stoppers?

A. Glass.

Q. Who shipped them to you?

A. Well they were shipped from three places, one from Urbana, one from City Hall, and one from the University.

Q. City Hall in Chicago, you mean?

A. Yes sir.

Q. Describe how you filled the bottles?

A. Well I had a rigging to put them in, I expect about that long (indicating). One for the large bottle and one for the small bottles and they fit in there.

Q. What was this rigging made out of?

A. Iron or steel; I don't know which.

Q. Where did you get this rigging from?

A. From Prof. Irons.

Q. Of the University of Chicago?

A. I think he is from Urbana; I ain't sure; I think he is from St. Louis.

Q. Now just describe how you worked it?

A. Well I would fasten the bottles in, submerge it and draw the stopper and then shove it in and shut it again
4835 and take it out.

Q. You did that with all the samples you collected?

A. Well, I got to pouring off air space; I was told to; I forget who it was told me, there should be an air space, but I loosened the cork up enough to let the air space out and placed it back.

Q. And that is a process which you employed in collecting all the samples which you collected?

A. Well, that was in collecting for this five and a half weeks, which I took to St. Louis over a year ago last winter. I didn't have this machine during that sixteen months or fourteen months that I made collections.

Q. How did you collect the water before you got the machine?

A. In warm weather I rolled my sleeves up and went down above my elbows and removed the cork while it was down there and put it back when it was full and let the air space out and put it back.

Q. In cold weather what did you do?

A. In cold weather I had a rigging similar to what Brooks described there, in fact I took a patent off of his, I couldn't stand that ice water in cold weather.

Q. Now when you filed the bottles, when did you insert the stopper?

A. Right away.

4836 Q. After you got the bottles filled and stopped up, stare what you did with them?

A. I went ashore and packed them.

Q. How did you pack them?

A. I had excelsior; packed them in excelsior the large bottle; would leave a space and put some ice on top of the excelsior; the small bottles I put in the can and filled the can with ice, and filled it with cotton and then filled the box all around with all the ice it would hold.

Q. Did you seal the bottles?

A. Yes sir.

Q. After you sealed them what did you do?

A. Well then I packed them right away after I sealed them.

Q. Did you attach any tag to them?

A. Yes sir.

Q. I show you a tag which is a tag for sample No. 2613, and ask you if you placed a tag similar to that tag upon all the samples of water which you collected and shipped, making the proper memorandum upon it?

A. Yes, if I didn't make no mistake once in a while of a figure; I don't think I did.

Q. Did all the tags contain instructions written on the back?

A. Yes sir.

4837 Q. Did you follow these instructions?

A. As near as I could.

Q. Did the tag which you attached to the bottle contain the sample number, the date, place taken, your name, height of water, temperature of water, direction of wind, temperature of air, absence or occurrence of rain, with direction, upon the back?

A. Yes sir.

Q. After these samples had been prepared in the manner that you have indicated, where did you take them, and to whom did you express them?

A. I took them to West Alton and expressed them to these three places, one to each place.

Q. The University of Illinois?

A. Yes sir.

Q. Chicago University and the Health Department of the City of Chicago?

A. Yes sir.

Q. Do you know whether Prof. Palmer was the one that you sent them to at the University of Illinois?

A. I believe his name was on one envelope; I ain't sure.

Q. Whose name was on the ones for the University of Chicago, Prof. Jordan?

4838 A. Well now I couldn't say; Jordan was one of them.

Q. What express company did you send them out by?

A. Well, I couldn't say; the train used to leave at eight o'clock in the evening and I couldn't say the express company.

Q. What express companies do you have in West Alton?

A. Well there is just a depot there and the express office, and there is four or five roads, I believe runs along there and I don't know which one handled the samples.

Q. You took them to the general express office and sent them on their journey?

A. At West Alton, yes sir.

Q. And what road or what express company they went by you don't recall?

A. No sir.

MR. TODD: Mr. Commissioner, I ask to have card of sample No. 2613 marked "Sanitary District of Chicago's exhibit No. 4 for identification."

Received and so marked.

CROSS-EXAMINATION.

By Mr. Jeffries.

Q. What is your occupation?

A. Fisherman.

Q. How long have you been engaged in that business?

4839 A. 19 years.

Q. Where did you get the bottles that you filled?

A. At West Alton.

Q. Were they expressed to you?

A. Yes sir.

Q. Large boxes of them, were there?

A. No they was about that long and that deep and that wide (indicating).

Q. How many samples each week did you take?

A. I made collections once a week for each sample box.

Q. You say you put the bottle down in the water, pulled the stopper and let the bottle fill; then drew the bottle from the water, pulled the stopper out and let enough water run out to form an air space?

A. Yes sir.

Q. And then you put the stopper back in the bottle?

A. Yes sir.

Q. How long after the samples had been taken before they were shipped?

A. Well it would be I expect three hours, from the time they were collected until they were shipped.

Q. Where did you take them to seal them and pack them?

A. Back to the shore; I live right on the river.

4840 Q. Did you rinse the bottles out before you filled them?

A. I did do that, but I didn't continue it all through.

Q. Why didn't you continue it?

A. Well, it was in the right cold weather; the bottle would freeze with a glare of ice all over it, particles of ice like needles was in the water.

Q. So when there was cold weather on, you didn't rinse the bottles?

A. Not the severest weather.

Q. But you did rinse the bottles in warm weather; hot weather?

A. Yes sir.

Q. Now state how you rinsed the bottles?

A. Well I would get it down and submerge the cork under the water, let a little in shake it around and pour it out; and put the cork in again and put it down and get my water.

JAMES MATHEWS.

4841 Grafton, Illinois, July 14, 1903.

V. J. SCHUMACHER,

called as a witness in behalf of the defendants, being first duly sworn, by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. V. J. Schumacher.

Q. Where do you live?

A. Grafton, Illinois.

Q. What is your business?

A. Pilot.

Q. On what rivers?

A. Illinois and Mississippi.

Q. How long have you been a pilot?

A. Six years.

Q. What did you do before you became a pilot?

A. I was an engineer,—steamboat engineer, or mate either one, half of the time one and half of the time the other.

Q. For how long?

A. For fourteen years.

Q. Upon what rivers?

A. Mississippi and Illinois, mostly on the Illinois river.

4842 Q. How long have you been acquainted with the waters of the Illinois River?

A. 32 years.

Q. From what points?

A. From St. Louis to La Salle, Illinois.

Q. During that time about how many trips have you made up and down the Illinois river?

A. Lord! I couldn't say; that's a hard one. Of course I couldn't give you the exact number of trips, because it was too much. I have been in the excursion business and been up and down the river every year, but I couldn't give you the exact number of times.

Q. Have you been on the Illinois river continuously during that period?

A. Yes sir.

Q. Prior to January, 1900, were you acquainted with the waters of the Illinois river?

A. Yes sir.

Q. What was the condition of the water of the Illinois river from La Salle to Grafton prior to January 17th, 1900, the date of the opening of the drainage canal?

MR. JEFFRIES: We object for the reason that it is incompetent and immaterial.

4843 A. Well, of course I can't give you the exact date, but then during the time since that before the drainage canal went in there the water was green; the water from, well, we will say from Beardstown up it stunk; we couldn't drink the water; it would foam the boilers; but now we can go along and drink the water; we pump the water and use it on excursion boats; before we could not.

Q. Before the opening of the canal what was the color of the water, if you know?

A. Before the opening of the canal we had a green scum on the river;—it smelled bad, it wasn't fit to drink; we would have to get water from the shore; but since the drainage canal we don't have to do that.

Q. Before the opening of the drainage canal, do you know what effect the water of the Illinois river had upon the fish that lived in the water?

A. Yes sir.

Q. What was it?

A. Before the drainage canal came in, we would find dead fish floating in the river; tons of them floating in the river above these dams; since the opening of the canal we have had better water and better fish.

4844 MR. JEFFRIES: I move to strike out all the testimony of the witness to the effect that the water in the Illinois river is better since the opening of the canal than it was prior to the opening, for the reason that the witness has not qualified as an expert upon the sanitary condition of the water for domestic use.

Q. Where was it in the Illinois river that these dead fish were found?

A. Down at Copperas Creek dam; also at the dam below Beardstown, right below Beardstown.

Q. Where else?

A. Also at Campsville; we found them up there every time we would go through there; the boys would make remarks about it on board the boat, about the fish there.

Q. How far down the river would that condition prevail?

A. Well, they would be laying along the shore; after they would pass over the dam they would lay along the shore; but nothing floating; there was no floaters; there would be no current them days to drive the fish along and consequently the fish would drift out to the bank.

Q. At that time how far up the river did you find the green scum?

A. We would find it plumb to La Salle.

Q. And where did that green scum cease to appear down the river?

4845 A. Well, it would generally go down about to Alton before it would begin to vanish, to spread out and go over all parts of the water of the river.

Q. How would the water at Grafton compare with the water at Beardstown and at Pekin?

A. I don't know as it would be much difference in the water at the two places; of course further down the river the water would naturally become more pure on account of the current in the river.

Q. What effect did you observe the sewage from Peoria, and the distilleries and cattle sheds at that place, have upon the waters of the Illinois river, and the glucose factory there?

A. Why, those distilleries would have great piles of stuff in the river; it would lay there, and a steamboat would come up and throw great mounds of it up in the river; and the water would stink; we don't see that any more.

Q. How would the water above Peoria compare with the water below Peoria?

A. Well, the water was better above Peoria always; it was some better than it was below, because it was stiller up there, because this sewage business couldn't go up the river and consequently it didn't have this bad green smell and look to it that it had below Peoria always, but we find we have a good deal better water in the channel now than we had before.

4846. Q. Before the opening of the drainage canal did the people living upon the Illinois river drink the waters of the Illinois river to any considerable extent?

A. We never drank it at all; we would dig holes along the bank or the shore or sink pumps down and get the water that way.

Q. Since the opening of the drainage canal and the admission of Lake Michigan water into the Illinois river, what has been the effect of that water upon the water of the Illinois river?

A. They don't drink—

MR. JEFFRIES: Just wait a minute. The question is objected to because the witness has not sufficiently qualified himself to be able to distinguish the difference between good water and bad water for domestic purposes, or drinking purposes, and for the reason that the witness has not qualified himself as a person able to give an opinion as to the sanitary or unsanitary condition of water, and for the further reason that various persons might drink water, believing from its appearance that it was reasonably wholesome, while in fact it contained more impurities than water less clear.

MR. TODD: In reply to the objection I wish to state that this witness is not offered as an expert chemist, bacteriologist or epidemiologist, but merely as a layman who has lived and
worked upon the Illinois river for the last fifteen years
4847 or more and has had ample opportunity of observing the
waters of the Illinois river before and since the opening
of the drainage canal, and in law we are entitled to have his opinion in regard to the water and other conditions pertaining to the water not as a scientific expert but as a layman.

MR. JEFFRIES: We move to strike out the argument of counsel interposed as an explanation of the testimony of this witness.

(Question repeated) In your opinion as a layman and a man who has observed the conditions along the river?

A. The water has been better since.

Q. In what way better?

A. Better to drink and better to use in every way in the river.

Q. Has the green scum disappeared from the water?

A. Not entirely; to a certain extent, more than it ever was before.

Q. Has the odor of the water disappeared?

A. Yes, sir.

Q. Has the water become more clear than heretofore?

A. Yes, sir.

Q. What has been your observation as to the condition of the water above Peoria before it takes on the sewage of the city of Peoria, since the opening of the drainage canal, as to whether
it is a better water than it was before the opening of
4848 the drainage canal?

A. Now, I can only say from last year; I haven't been up there this year, and last year from July on to late in the fall when we left there, we used the water; before we didn't, from above Peoria up and below Peoria we didn't use no water until we got to Beardstown.

Q. How does the water at Grafton—what is the condition of the water at Grafton at the present time?

A. Well, I believe the water is better than it was before; in fact, we have more water and more current in the river than we had before.

Q. How does the water at Grafton compare with the water at Pekin, immediately below Peoria?

A. Well, there is a good deal of difference in that; it is like a man taking a drink of river and taking a drink of spring water; like where there had been rotten fish or somebody had been laying in it. I wouldn't want to drink the water there. Here we drink the water all the time when we are out in a skiff or such places, when we put ice in it to cool it.

Q. Do you know how many people or approximately how many people live along the Illinois river from LaSalle to Grafton in fish boats or flat boats?

A. No, sir, I do not; there is too many of them.

4849 Q. Have you any idea of the number of people engaged in the fishing industry along the Illinois river, who live upon the river and drink the water of the Illinois river?

A. No, sir, I do not; there is too many of them.

Q. What do you mean by too many of them?

A. Why, there is more than I could tell you. What I mean by that is that there is so many fishermen that live upon the river in cabin boats that I couldn't tell you and tell you the exact number or the amount that is there.

Q. Does it run up in the thousands?

A. Well, it gets pretty close to it I believe, yes, sir.

Q. Have you learned of any sickness that has been attributed to the waters of the Illinois river since the opening of the drainage canal among people living upon the river and drinking the water?

MR. JEFFRIES: We object to the question for the reason that the witness has not qualified himself as being acquainted with the people along the Illinois river, nor has he qualified himself as a witness on the question as to whether or not such persons were affected with diseases caused by bad water, or by some other cause.

A. No, sir; I have not.

4850 CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long did you say you have lived on the Illinois river?

A. I have been on the river since I was twelve years old.

Q. How old are you?

A. 36 years old.

Q. Then you have known the river 24 years?

A. Yes, sir; I have known this river longer than that; 25 years I have been on this river—24 years, that's right.

Q. The first service that you did on the river in the way of steamboating was either as mate or engineer?

A. No, sir; the first service I done in steamboating was firing; I served a year at that.

Q. You served a year at that you say?

A. Yes, sir.

Q. Then you went from that to engineer and mate?

A. Yes, sir.

Q. And then to Pilot?

A. Yes, sir.

Q. I understood you to say that prior to the opening of the canal there was a green scum formed on the Illinois river?

A. That was before the canal was opened?

Q. Yes.

A. Yes, sir.

4851 Q. To what extent did that scum form and what seasons of the year?

A. Well, during the summer seasons or late in the fall until the ice would drive it out.

Q. What was the extent of it?

A. From bank to bank.

Q. All up and down the river?

A. Yes, sir.

Q. Would that green scum freeze up in the winter time?

A. Why, yes, sir; it would to a certain extent; not as bad as it would be in the fall, but where it would be in the eddy, where they would cut ice, there would form that green scum in the water.

Q. You don't know what caused that green scum?

A. No, sir, I do not, unless it would be from the filth in the river, from the water,—there not being no current in the river.

Q. Now, if there had been a current to any great extent, the probabilities are that there would have been no scum?

A. Well, sir, we have a current now, and we have a little scum now.

Q. But there has been no scum to any great extent?

A. No, sir, not to any great extent.

4852 Q. So, then, even though there is a current, the impurities are still in the water, unless the current has taken it out, or else the pure water from the lake has carried it out; isn't that true?

A. I hardly understand what you mean by that.

Q. (Question read). I mean by that, the impurities in the water that formed this scum where there is no current. Now, the impurities in that water are still there, unless the current has taken them out; now isn't that true?

A. The impurities would still be in there unless the current has taken them out, is that what you mean?

Q. Yes?

A. Well, of course, I expect that is right, that the impurities would still be in there, but if it was not for this dead water there would be no scum. We understand that. This scum comes from behind these islands and in these dead pockets where there is no current.

Q. Now, there is no other additional volume of water coming down the Illinois river since the opening of the canal than that which comes through the canal, that was not coming down the river prior to the opening of the canal?

A. Oh, yes; we have the same waters coming into the river today that came in before the canal came in.

Q. That's what I understand exactly, but you have no
4853 other waters?

A. No, sir.

Q. Other than the canal?

A. Other than the canal.

Q. Then as you understand it, the opening of the canal and the water from Lake Michigan coming through the canal, is the cause of the additional volume of water in the Illinois river and the current that now exists in that river?

A. Yes, sir. Of course it's not altogether the amount of water that is there now because we have had a swell in the river.

Q. That was due to local showers, local rains up the river?

A. Yes, sir.

Q. Now, when you say that the water is better now than it was prior to the opening of the canal, you simply mean that first there was no scum on the water, second that the water is clearer than it was prior to the opening of the canal, and that it has no bad odor or anything of that kind?

A. I don't mean that the river had no scum on it at all; it had the scum on it, and it has a little scum on it now, but not as bad as it was before the opening.

Q. Now, state your reasons for saying that the water in the Illinois river is better since the opening of the canal
4854 than it was before the opening of the canal?

A. Before the opening of the canal we had no current in the river to purify the water. We would carry water in buckets and tubs for to supply our boats with to drink. Since we had the current in the river, we dip the water from the river and drink it, by putting ice in it to cool it off.

Q. Now, the fact then that there is a current in the river, is the principal reason for your saying that the water is better now than it was prior to the opening of the canal?

A. The reason why I say that is that the current purifies the water; where there is no current there must be stagnated water; that's the reason why I put it that way.

RE-DIRECT EXAMINATION, by Mr. Todd.

Q. You are not attempting to give the reasons—

MR. JEFFRIES: I will have to object to that as being leading.

Q. You are not attempting to give the reasons why the water since the opening of the canal is better than it was before; but you are simply stating what in your opinion is a fact, are you not?

MR. JEFFRIES: I object for the reason that it is leading.

A. Yes, sir.

4855 Q. What is the main fact that makes you say that the
water is better in the Illinois river today than it was before the opening of the drainage canal?

A. You mean, why do I say this?

Q. Yes.

A. The reason why I say this, is because the water is better and I know that it is better from using it, and the hundreds and hundreds of people that we carried on the steamboats, using the water and not kicking against the water.

RE-CROSS-EXAMINATION, by Mr. Jeffries.

Q. That's all you know about the water in the Illinois river?

A. Yes, sir.

V. J. SCHUMACHER.

4856 Grafton, Illinois, July 14, 1903.

B. F. ROBINSON, called as a witness in behalf of the defendants, after being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. B. F. Robinson.

Q. Where do you live, Mr. Robinson?

A. At Grafton, Illinois.

Q. Mr. Robinson, did you take water for the Sanitary District?

A. Yes, sir.

Q. When did you take it, what years?

A. Well, I don't remember—1900—1899, 1900 and 1901.

Q. For whom did you take water?

A. Well, I commenced for the Chicago Health Department and for the University of Chicago, and also for Dr. Palmer for the University at Urbana.

Q. Of Illinois?

A. Yes, sir.

Q. Where did you take samples of water from?

A. From the Illinois and the Mississippi.

4857 Q. The water that you took in the Illinois was taken at what point?

A. About two miles from here.

Q. Above the mouth?

A. No, sir; not that far, about a half a mile above the mouth.

Q. Of the Illinois?

A. Yes, sir.

Q. How many samples of the water of the Illinois did you take at a time?

A. There was times I took more than others; but I don't remember exactly the number. I took for bacteria and a chemical sample at each place.

Q. How many samples did you take across the Illinois river in one day?

A. I never took them that way; I don't remember exactly how many times, but I don't think we took them that way over a dozen times, if that. I never took them that way only when one of the parties was with me. I just had orders to take a certain amount. They just sent so many bottles.

Q. How—where did you take samples on the Mississippi river?

A. That was out just above what they call Little Island—I don't know the other name for it.

4858 Q. It is above the mouth of the Illinois river on the Mississippi river, is it not?

A. No, sir.

Q. Where would it be?

A. Right out here, right out in this direction (indicating).

Q. Below the mouth of the Illinois river?

A. Yes, sir.

Q. Were these samples which you took in the Mississippi river, Mississippi river water?

A. Yes, sir.

Q. Were any of the samples that you took in the Mississippi river Illinois river water?

A. No, sir; I don't think it was.

Q. You took water from the Mississippi river unmixed with Illinois river water?

A. Yes, sir.

Q. And you took water from the Illinois river unmixed with Mississippi river water?

A. Yes, sir; so far as I know.

Q. Now, after you had taken these samples of Mississippi river water and Illinois river water, what did you do with them?

A. I brought them down home and I put the directions on them where I got them; stated the time; and iced them and took them to the depot.

4859 Q. Now, where did you get the bottles from that you filled with water from the Illinois and Mississippi river?

A. I got some from the health department of Chicago, some from the University of Chicago and some from the University at Urbana.

Q. When these bottles came to you were they corked up with a glass stopper?

A. Yes, sir.

Q. Now, just explain how you filled the bottles with water from the Illinois river and from the Mississippi river?

A. I would just take them by the neck hold the stopper and shove them down.

Q. How deep under the water would you fill the bottles?

A. Just as far as I could reach, down to the elbow.

Q. When would you place the stopper in the bottle?

A. Just the minute I raised it up.

Q. And after you placed the stopper in the bottles you took them to shore where you sealed them, tagged them and expressed them to the University of Chicago, the Health Department of the City of Chicago and the University of Illinois?

A. Yes, sir.

Q. The tags which you placed upon each bottle of water which you collected, did you place the sample number, the 4860 date of collection, the hour of collection, the place of collection, with your name on the cards, the gauge of water, the temperature of the water, direction of the wind, temperature of the air, notation about rain—

A. No, very little I noticed of that.

Q. And did the cards contain the instructions for collecting and sending the sample for analysis printed on the back?

A. .Yes, sir.

Q. I show you a card, sample No. 2618, and ask you to state whether that card is in your handwriting?

A. Yes, sir.

Q. And whether you placed a similar card with proper memorandum, upon each sample of water collected by you and sent to these different parties.

A. Yes, sir.

Q. Did you follow the instructions on the back of the card?

A. Yes, sir; as near as I could.

Q. How did you pack the samples for shipping?

A. They were packed in gallon bottles; the small sample was put in a small can, and that was covered; then the can put inside of a gallon bucket with ice around it; that was my instructions. They were placed in cases of course, or boxes.

4861 Q. And were shipped from Grafton?

A. Yes, sir.

Q. By what express company?

A. Adams.

MR. TODD: Mr. Commissioner, I will ask to have this card sample No. 2618, as testified to by the witness, marked "Sanitary District of Chicago's Exhibit No. 5 for identification."

Said document so marked by the Commissioner.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. What is your business?

A. At present I am a clerk, and a carpenter.

Q. What were you doing at the time you took these samples?

A. I was doing a little fishing, and after that was just after odd jobs, whatever I could find to do.

Q. How often in each week would you take these samples?

A. Well, I couldn't say.

Q. Well, about?

A. During the test I took every day.

Q. What do you mean by the test?

A. That is when they were going through the three months test.

4862 Q. Now, after that how many times did you take them each week, after the test?

A. Well, I quit there; I didn't send any more.

Q. Well, before that?

A. Before that I don't remember; I couldn't say. I haven't kept no record of it; I had no orders to that effect; I would just get my orders you know, to send so much water and I would go and get it, and that was all there was of it; I kept no record of it. Of course I could if I had just thought of it.

Q. Now, after these samples of water were collected, how long would it take, or be before you got them to the express office?

A. Well, I had no regular time; it just depended on the weather.

Q. Two hours?

A. Oh, yes, two hours and sometimes longer.

Q. Sometimes four hours?

A. Yes, sir.

Q. Now, did you get them sometimes to the depot too late to get them out that day?

A. No, sir; I don't think they got there once but what they went on time; if they did, I didn't know anything about it, because I always got them there before the train left.

Q. What time did the train leave?

A. 5:35.

4863 Q. What time did you get the sample?

A. Well, I aimed to get them right after dinner; but if it was bad weather, sometimes I would get them before dinner, but as a general thing I would try to get them as late as I could in the afternoon.

Q. What kind of an instrment did you use?

A. With my hands.

Q. How deep under the surface of the water did you go to get the sample of water?

A. I aimed to reach as far as my elbow.

Q. About a foot?

A. Yes, sir.

Q. Did you uncork the bottle after you put it under the water?

A. No, sir; I pulled the stopper and put the bottle in.

Q. Then you got some water from the surface?

A. I didn't suppose I did by having the air in there; I didn't suppose I did, but that was my instructions.

Q. Did you rinse the bottles?

A. Yes, sir.

Q. According to the instructions?

A. Yes, sir.

Q. When did you cork the bottles?

4864 A. Just the moment I raised it up.

Q. Out of the water?

A. Yes, sir.

B. F. ROBINSON.

4865 Grafton, Illinois, July 14, 1903.

JAMES M. ALLEN, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. You may state your name, residence and occupation?

A. James M. Allen; residence, Grafton, Illinois; retired miller.

Q. What official position do you occupy in Grafton?

A. I am chairman or president of the Town Council.

Q. What is the geographical position of Grafton with reference to the Illinois and the Mississippi rivers?

A. We were formerly located on the Mississippi river, but since the Government has built dikes between Calhoun county and the island opposite, we are now located on the Illinois river, and are so, in fact, in low water.

Q. Calhoun is a county of Illinois located between the Mississippi and Illinois rivers?

A. Yes, sir.

Q. How far from Grafton to the southern point of Calhoun county?

A. Two miles.

Q. So that formerly, the mouth of the Illinois river was two miles or more above Grafton?

4866 A. Yes, sir.

Q. How long have you lived in Grafton?

A. 56 years.

Q. What has been your business and occupation in Grafton since you arrived at man's estate?

A. Miller, flour milling.

Q. Are you in a general way—were you in a general way, acquainted with the waters of the Illinois river prior to the opening of the drainage canal?

A. Yes, sir.

Q. What was the condition of the water at that time in this vicinity?

A. Well, at times in low water, it was almost stagnant.

Q. Was there any perceptible odor about the water when it was stagnant?

A. At times, yes, sir.

Q. Was the water used for drinking purposes to any extent?

A. Not when we could help it.

Q. What was the appearance of the water as to color, or its being muddy?

A. Frequently it was covered with a green scum.

Q. Since the opening of the drainage canal, what has been the condition of the water?

4867 A. At the times when I have seen it, it has been better, but whether it has always been better, I couldn't say.

MR. JEFFRIES: We object to any testimony from this witness upon the character of the water for domestic or drinking purposes, for the reason that he has not qualified as being possessed of sufficient scientific knowledge to express an opinion or belief as to the sanitary condition of water; for the further reason that experience shows that various people will insist upon drinking certain water known to be diseased and infected, with no other excuse than that the water is clear water, and for that reason the testimony of this witness as a layman is immaterial, irrelevant and incompetent.

It is agreed that the above and foregoing objection shall apply to all testimony of all witnesses whose testimony is taken upon the Illinois river, who are not experts, and that this objection shall be treated and considered as applying to all such testimony, without its being further stated. (F. S. B., Com'r.)

Q. Better in what respect?

A. Well, it was purer, and looked better.

Q. Has Grafton a public water supply?

A. No, sir.

Q. From what source do the people obtain water at Grafton?

A. Wells and springs.

4868 Q. Does any portion of the population obtain water for domestic purposes from the river?

A. I think not.

Q. The water—you may state what water is next the shore on the Mississippi river at Grafton, Illinois river water or Mississippi river water?

A. As a usual thing it is Illinois river water; there are times, though, when the Mississippi river predominates.

Q. When is that?

A. Any time when there is a raise in the river, especially if the Mississippi is higher, the current comes through to this shore, and we get Mississippi water, frequently backing up the Illinois river for some miles.

Q. Do you know whether there is a population in and about Grafton engaged in the business of fishing?

A. Yes, sir.

Q. Do you know whether in their fishing operations they use or drink the water of the Illinois river since the opening of the drainage canal?

A. I suppose they must to a certain extent.

MR. JEFFRIES: That question is objected to as being irrelevant, and not tending to prove or disprove any issue in the case.

4869 Q. JUDGE JOHNS: Since the opening of the drainage canal in January, 1900, has there been any stagnant water or water having a green scum upon it, in the Illinois river near this point?

A. Well, I think there has.

Q. At what season?

A. That would be I think in 1901, along the summer months, the fall months.

Q. What kind of a season as to rainfall was the summer of 1901?

A. It was unusually dry.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Why do you say the water of the Illinois river is better since the opening of the Chicago drainage canal than it was prior to it?

A. For the reason that there has been a larger body of water in it and the current has been stronger.

Q. How much stronger has the current been?

A. I could hardly say.

Q. Well, approximate it?

A. Well, I should say perhaps a mile an hour.

4870 Q. You speak, then, from the standpoint that water will purify itself in a running stream?

A. I have always believed that, yes, sir.

Q. And your testimony in this respect is based upon the theory that the water is void of the green scum now?

A. Well, it has a better appearance, and isn't sluggish, and there isn't as much of that scum on the surface as it formerly had.

Q. Are you acquainted with the Illinois river from its source to its mouth?

A. No, sir.

Q. Did I understand you to say that the people of Grafton did not use the water from the Illinois river?

A. No, sir.

Q. Where do they get their water supply?

A. From wells and springs.

Q. And they cut their ice from the Mississippi?

A. Well, they cut their ice from the river and if you call it the Mississippi it is the Mississippi, and if you call it the Illinois, it is the Illinois, usually in winter time when we cut ice it is Illinois ice, from the Illinois water.

Q. When you speak of the water from the Illinois river being better now than prior to the opening of the canal, 4871 you speak simply from your observation of that water?

A. Yes, sir.

Q. Rather than from its use by you?

A. Yes, sir.

Q. You don't use it?

A. Very little.

RE-DIRECT EXAMINATION, by Judge Johns.

Q. What is the population of Grafton?

A. 988.

J. M. ALLEN.

4872 Grafton, Ill., July 14, 1903.

WESLEY PARK, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Wesley Park.

Q. Where do you live?

A. Grafton.

Q. How long have you lived in Grafton?

A. Fourteen years.

Q. What is your business?

A. Practicing physician and surgeon—practice of medicine and surgery.

Q. How long have you been engaged in that business?

A. About 43 years.

Q. Are you acquainted with the Illinois river?

A. Yes, sir.

Q. How much of the Illinois river are you acquainted with?

A. Well, practically between Grafton and Hardin, but not much above Hardin.

Q. How far is that from here?

A. About 30 miles by river.

4873 Q. Were you acquainted with the Illinois river before the opening of the drainage canal on January 17, 1900?

A. Yes, sir.

Q. Have you seen the waters of the Illinois river since that time?

A. Yes, sir.

Q. Were you acquainted with the waters of the Illinois river above Grafton before the opening of the drainage canal as far up as Beardstown and Peoria?

A. As far up as Hardin; not up as far as Beardstown.

Q. Was the water of the Illinois river at Grafton before the opening of the drainage canal, better or worse than the water at Hardin?

A. Better or worse than the water at Hardin?

Q. Yes.

A. I didn't notice any difference in the water at Grafton and Hardin, prior to the opening of the canal.

Q. Since the opening of the drainage canal, has the condition of the water of the Illinois river at Grafton been better or worse than it was before the opening of the drainage canal?

A. Why, I think it is better, purer, clearer, and greater current.

Q. What was the condition of the water of the Illinois river at Grafton before the opening of the drainage canal?

4874 A. It was at other times sluggish, more than it is now; more or less green scum or polluted, whatever it is; more or less moss covered the water prior to the opening of the canal; the current wasn't as swift; the water was more sluggish, more of an impure character.

Q. Since the opening of the canal what is the condition of the water?

A. We have a greater volume, stronger current, clearer, and purer water, is my observation.

Q. In your practice as a physician, have you had anything to do with the fishermen who live in Grafton and whose occupation takes them upon the Illinois river?

MR. JEFFRIES: We object to the question; in addition to the objection urged in reference to the testimony of Mr. Allen, for the reason that it is incompetent and immaterial, and does not prove or tend to prove any issue in this case, and does not prove or tend to prove that the disease laden water coming from Chicago has been purified, and does not prove or tend to prove that the water is in better condition since the opening of the canal than prior to its opening, and does not prove or tend to prove the sanitary condition of the water of the Illinois river.

A. Yes, sir.

4875 Q. What is the population of Grafton?

A. I think between eight and nine hundred; I am not sure about that.

Q. How many doctors are there at present in the city of Grafton?

A. Two.

Q. Have you had any typhoid fever cases among the fishermen and men who live upon the Illinois river, and who pursue their calling upon the Illinois river, since the opening of the drainage canal in 1900?

MR. JEFFRIES: We object to the question for the reason that it assumes that fishermen living on the Illinois river use the water of the river for domestic and drinking purposes.

A. I can't call to mind now any case of typhoid fever among the fishermen in the last three or four years; I can't call to mind any.

Q. Among the sicknesses that you have attended during the last three years, have you attributed as a cause of the sickness the waters of the Illinois river?

A. No, I don't know of any what you call—I don't know of any cases that I have had that I could attribute to zymotic causes; that is of a typhoid character that could be caused by drinking Illinois river water; we have sometimes cases
4876 that we call typho-malarial fever, which is a misnomer; it is simply a continued fever from miasmatic causes; not from a zymotic cause.

Q. How many fishermen do you know who live in Grafton, that are engaged in the fishing business at this point and up the Illinois river?

A. Well, between this and Hardin I certainly know fifty; I think I do; I couldn't tell without counting them; but that is the best of my judgment.

Q. Doctor, from your observation and knowledge of the waters of the Illinois river, what is your opinion as to whether or not the waters of the Illinois river at Grafton are better or worse now than they were before the opening of the drainage canal?

MR. JEFFRIES: That's objected to for the same reason as stated in the objection to Mr. Allen's testimony, for the reason that the witness is testifying as a layman and not as an expert.

A. Well, from a knowledge based upon appearances and a use of the water, I would say that the waters are much better than they were before the canal was opened, and I mean by that its appearance, it has a purer appearance.

4877 CROSS-EXAMINATION, by Mr. Jeffries.

Q. Doctor, what is the difference between what we call the ordinary typhoid fever and typho-malaria?

A. Typhoid fever is what is called a zymotic disease and is a blood poison; it comes from a decay of animal matter. Malarial fever comes from a decay of vegetable matter—miasmatic or malaria, which means bad air, you understand. Now, then chills and fever is a malarial fever or a miasmatic fever. We have a continued form of that sometimes instead of intermittent fever; that we call typho-malarial fever. Typho means like typhoid, that is the grade becomes low and continuous. You understand that chills and fever comes every day or every other day.

Q. Then, as I understand you there is no resemblance so far as the materiality of the disease is concerned?

A. No, sir. It is really a misnomer; there is really no such thing as typho-malarial fever, but physicians have got in the habit of calling it that and it is very often spoken of as such in medical works and medical journals, but the fact is that it is a misnomer; that is all; simply a continued form of malarial fever.

Q. When you say that the water in the Illinois river is better now than it was prior to the opening of the canal
4878 you simply mean by its appearance, do you not?

A. Yes, sir; simply from its appearance and its use; what I have known of its use.

Q. Does there any green scum form on it now?

A. No, sir; I haven't noticed it.

Q. Why does it not?

A. Because the current is swifter.

Q. How much swifter, doctor?

A. Well, it is said now that the current is about six miles an hour; I don't think it used to be six feet an hour thirty years ago—at that time I used to cross over to Hardin and go back and forth in the same track where the canoe had parted the scum, hours before.

Q. Now, what was the condition the year prior to the opening of the canal, the same?

A. Yes, sir.

Q. Right up to the time of the opening of the canal?

A. There is no scum over it now.

Q. Yes, but I mean that condition you have just stated, with reference to the scum being opened by the skiff or canoe obtained some thirty years back and right up to the date of the opening of the canal covered that series of years?

A. Well, so far as I recollect it, more or less.

4879 Q. What, if you know, caused this increase in the volume of water and this increased flow of the current in the Illinois river? What was the cause of it, if you know?

A. My idea is gained from my knowledge of their having opened the canal; throwing the water from Lake Michigan into the canal.

Q. The people here that live in Grafton, get their water from wells and springs, do they?

A. Yes, sir.

RE-DIRECT EXAMINATION, by Mr. Todd.

Q. Do you pump the water out of the river into a tank?

A. No, sir. Mr. Meisenberg has a pump that he elevates the water into a tank and I pipe from his tank some five or six hundred feet to my residence. I have used that water for a number of years, five or six years perhaps; water pumped out of the river, elevated into the tank and then piped from the tank to my house.

Q. Is that water used for domestic purposes?

A. No, sir; more for stock; just for that. I never have used it only for washing purposes and for stock; I don't use it as a beverage, or for cooking; never had occasion to.

Q. Does that water have any injurious effect upon stock?

A. No, sir. I could add that a family living close to me, use it for domestic purposes.

4880 RE-CROSS-EXAMINATION, by Mr. Jeffries.

Q. How large is that tank?

A. Oh, I suppose it holds a thousand or twelve hundred gallons.

Q. The water is pumped into the tank and then allowed to settle, is it not?

A. Well, yes. During the hot weather we run one or two tanks full a day; pump it in for our use; use it for lawn purposes, sprinkling lawns, etc.

Q. Now was that pump and tank in operation prior to the opening of the canal?

A. I can't answer that.

Q. Well, the canal was opened in January, 1900, now you stated a moment ago that this tank and pump had been in operation about five years?

A. I think that is correct; I think it was up prior to the opening of the canal.

Q. Now, the water in that tank is put to the same use now as it was when it was built?

A. Yes, sir.

Q. And no other use?

A. No, sir.

WESLEY PARK, M. D.

4881 Grafton, Illinois, July 14, 1903.

E. MEYSENBURG,

called as a witness in behalf of the defendants, being first duly sworn, by the Commissioner, was examined in chief by Mr. Todd and testified as follows:.

Q. What is your name?

A. E. Meysenburg.

Q. Where do you live?

A. In Grafton.

Q. How long have you lived in Grafton?

A. Since 1867.

Q. What is your business?

A. I am doing a little banking and merchandising business here.

Q. What is the name of the bank with which you are connected?

A. Grafton Bank.

Q. Who is the president of it?

A. I am the sole proprietor.

Q. Are you acquainted with the waters of the Illinois river at Grafton?

A. To a certain extent, yes sir.

Q. To what extent, Mr. Meysenburg?

4882 A. Well, I have always been fond of the river; keep a boat of my own and have always spent considerable time on the river, fishing, hunting, and so forth. I live right on the bank of the river, what is virtually now the Illinois, since this dike has been extended down here.

Q. How far up the river from Grafton are you familiar with the Illinois river?

A. I would say fourteen miles.

Q. Were you acquainted with the waters of the Illinois river prior to the opening of the drainage canal in January, 1900?

A. Yes, sir.

Q. Have you seen and been on the waters of the Illinois river since the opening of the drainage canal?

A. A good many times.

Q. What is your opinion as to the condition of the water and the quality of the water now, as compared with what it was before the opening of the drainage canal?

MR. JEFFRIES: That is objected to—the former objection holds good.

A. I consider it much improved.

Q. In what way?

A. It is not stagnant water, as it was previous to the opening of the canal.

Q. How about its appearance?

4883 A. To my mind it looks much better.

Q. Have you used water of the Illinois river for domestic purposes since the opening of the drainage canal?

A. I have since this high water; my well and cistern were flooded during this high water and I used water out of my elevated tank during that time.

Q. Where did this water come from?

A. Well, from a well that is fed by the river.

Q. How long have you used that water?

A. I think it was June 11th when the water flooded my well; I have used it up to the present time, but had my well cleaned out today.

Q. Has your family used it?

A. To a certain extent, yes, sir.

Q. Have you experienced any deleterious effects from the use of the water?

A. There has been nobody sick at my house.

Q. Prior to the opening of the drainage canal what was the appearance of the water in the Illinois river?

A. It frequently looked like a stagnant pool; no current.

Q. Any scum on the top of it?

A. Oh, yes.

Q. Describe it.

4884 A. Well such as would form on a pond that had no current in it.

Q. Is there a current now in the Illinois river?

A. A decided current.

Q. Are you acquainted with the fishing industry at Grafton as it is carried on in the Illinois river?

A. Yes sir.

Q. Have you any knowledge as to the amount of fish that is shipped from Grafton, that are taken out of the Illinois river?

A. Well, Mr. Todd, I could only make a guess at that; at times there are many fish shipped from here; I have known as high as twelve tons shipped in one night; last week I was told that in one day there were fifteen thousand pounds shipped in one evening. Fishing is a queer business. The fish sometimes run for a week or two and then again the catch is very small; but the fishing industry is quite an item here.

Q. The Illinois river is quite a prolific fishing ground is it not?

A. Yes sir.

CROSS-EXAMINATION.

By Mr. Jeffries.

Q. This well that you said was fed from the river, how was it fed?

A. By I suppose seepage, from the river; it is close to 4885 the river as many wells here are.

Q. Then it occupied the position relatively speaking, of a living well?

A. Yes sir—if I understand you by a living well, is—

Q. Fed from some source under the ground?

A. Yes, fed from some source under the ground.

Q. Now do you know the character of the soil where that well has been dug?

A. Yes sir.

Q. What is it?

A. I went down; I bored down 26 feet before I dug the well, with the intention of having a bored well. I discovered that that wouldn't work. I then dug a well, about three years ago. The first six feet of this well is loam. We then struck about a foot of gravel. Below the gravel we struck a dark mucky soil such as you find a good deal in these bottoms. Below that we struck gravel again and some sand. We went down to the rock and we then got a good flow of water from the river.

Q. That is from the solid rock?

A. Close to the solid rock; it caved in on the river side and gave us plenty of water; the pressure from the river side was sufficient to cave it in and give us quite a chuck of it, which convinces me that it is river water filtered through the soil.

4886 Q. Now it is from this well that you have been using water since the 11th day of last June?

A. As near as I can remember, Mr. Jeffries, yes sir.

Q. You didn't go out into the river and dip the water up and use that water?

A. No sir.

Q. You don't use the water in that way?

A. No sir, never.

Q. Now when you say that the water in the Illinois river is better since the opening of the canal than prior to the opening you base your opinion solely upon the fact that the water is clearer, is that it, and free from the scum?

A. Partly that, Mr. Jeffries, and partly from the fact that I believe running water is better than water that is stagnant.

Q. That is true, is it, regardless of whether the water that is running has been polluted by animal matter or not?

A. Now you are propounding a very difficult question.

Q. Now you answered the question; I want to see how far you are going to go on that opinion?

A. My opinion is that swift running water, polluted 200 miles above where it is to be used, is good water to use.

4887 Q. Regardless of the volume of the water or the extent of the pollution.

A. Now you are going too far, you might get all pollution and then you would get nothing but pollution but where it is mixed with water that is fit to use as in this case, my opinion is, that it is decidedly better than it was then.

Q. When it is based on what you have testified to?

A. Yes sir, my opinion, if it is worth anything.

Q. Where is your house located with reference to the Illinois river?

A. Immediately on the bank.

Q. Now as I understand it, the Illinois River flows almost due south before it empties into the Mississippi river?

A. No sir, it flows due east.

Q. The Illinois river flows due east?

A. Into the Mississippi, yes.

Q. Now the government built a dike up the river from your house how far?

A. The government built a dike connecting Calhoun Point with the Island opposite Grafton.

Q. Now Calhoun point was formerly at the mouth of the Illinois river?

A. Yes sir, Calhoun divides the Illinois and the Missis-
4888 sippi rivers; it is a peninsula really between the two rivers.

Q. So since the building of this dike, connecting Calhoun Point with the Island which lies in the Mississippi river, or which at that time was in the Mississippi immediately to the west of Grafton, it moved the mouth of the Illinois river from its former position down to Grafton, is that correct?

A. Yes sir.

Q. Now is there any water at any time of the year flowing over this dike connecting Calhoun Point with the island?

A. Yes sir.

Q. Is there any time at which water does not flow over that dike?

A. Yes sir.

Q. What seasons of the year?

A. During low water the Mississippi is confined to its own channel, reaching to the warehouse at Grafton, where we are.

Q. From the lower end of the island?

A. Yes sir, this dike comes down here and ends just about opposite here.

E. MEYSENBURG.

4889 Grafton, Illinois, July 14, 1903.

JOSEPH SPANLE,

called as a witness in behalf of the defendants, being first duly sworn by the commissioner, was examined in chief by Judge Johns and testified as follows:—

Q. What is your name?

A. Joseph Spanle.

Q. What is your occupation?

A. Fisherman.

Q. How long have you been a fisherman?

A. Ever since 1851.

Q. Where do you live?

A. I live here at Grafton at the present time.

Q. Did you fish any in the Illinois river before January, 1900?

A. Yes sir.

Q. For how many years?

A. Ever since 1857.

Q. What was the kind of water in the Illinois river before the drainage canal was opened?

A. Well, I couldn't say much about it either way, but sometimes the water got too low.

Q. Did it smell sometimes?

A. Well, it didn't smell much, but it got kind of still; there was no current in it those days.

4890 Q. Did it have a green scum on it in the summer?

Objected to as leading.

A. Yes sir, lots of it sometimes.

Q. Was it good to drink?

A. No sir, it was no good to drink that time; that is in the part of the year when it was low. In high water we used to drink it, when the water was cold.

Q. What color was it?

A. Well, it was a natural color; I couldn't see no difference in the color much; that is in fact I never took notice of the color much either.

Q. Did you fish with nets before the drainage canal was opened?

A. Yes sir. We used to fish with seins and trammel nets, too.

Q. What got on your nets before the drainage canal was opened?

A. What got on it?

Q. Yes, moss and slime?

A. Yes moss and slime got on it three or four years ago I guess; some little moss yet, that comes once in a while, but that current washes it off more.

Q. Do you drink the water since the canal was opened?

Objected to as leading.

A. No sir. I haven't. In the winter time, when it was cold enough to drink. Yes.

4891 Q. Is the water lighter colored now than it was before the drainage canal was opened?

Objected to as leading.

A. It looks more clear now than it was.

Q. You are a German and do not speak English very well?

A. Well, I used to come from France. They used to call me a Frenchman; the state used to belong to France where I came from but now the Germans took it away from France.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. There isn't much more current in that river now than there was before the opening of the canal, is there?

A. Yes, there is a good deal more current, yes sir.

Q. You live here in Grafton?

A. Yes sir.

Q. Have you got a well at your residence?

A. Oh yes sir, I have got a big well too.

Q. Is it a living well or a cistern?

A. A well and cistern both.

Q. You have got both?

A. I got both, yes sir.

Q. You don't use the water from the river then?

4892 A. No sir, I don't use the river water at all when I am home, but when I am out I do use it sometimes.

Q. Not very often though?

A. Not without I have to.

JOSEPH SPANLE.

4893 Grafton, Ill., July 14, 1903.

DANIEL HEATH,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. Daniel Heath, residence, Grafton; occupation, fisherman.

Q. How long have you been a fisherman?

A. Twenty-odd years, I don't know exactly, 25 years probably.

Q. Did you fish in the Illinois river before the opening of the drainage canal?

A. Yes sir.

Q. For how many years?

A. Well, twenty-odd years, twenty-five years ago I fished there; ever since I lived in Grafton.

Q. Have you fished there continuously during that time?

A. Yes sir, every year.

Q. What was the condition of the water of the Illinois river before the opening of the drainage canal?

4894 A. After the spring freshets in the summer time, there was no current in there, the river was dead.

Q. What was the color of the water?

A. Well I don't know as I could say there was much difference in the color of it; it used to have a green scum on it just like a pond in the summer time.

Q. Did you drink it before the opening of the drainage canal?

A. Yes sir, we used to drink it in the cool weather, the summer and fall.

Q. What effect did it have upon your nets before the opening of the drainage canal?

A. Well there used to be a kind of a scum gather on them; *it would hang down in tassels.*

Q. Did the water have a smell?

A. Yes sir, in the summer time when it was stagnated it would smell.

Q. What has been the condition of the water since the opening of the drainage canal?

A. Well we have always had a current in there and the water always seemed to be purer because the current was in there; it kept the banks washed off, the current you know.

Q. Do you drink it now?

4895 A. Yes sir, in the spring and fall and winter. Not in hot weather we don't; not now; the weather is a little too warm.

Q. Are you acquainted with the fishermen in the lower part of the Illinois river?

A. Yes sir, I am acquainted with a good many of them.

Q. For what distance up the river?

A. Well I have been up as far as Campsville; I knew a lot of them a good many years ago; I have lost track of some of them; I know some up the river.

Q. Since the opening of the drainage canal how about the moss upon your nets?

A. Well there has been but very little moss; the nets used to be loaded with moss and we couldn't hardly pull them in the skiff at times; we hardly ever see it any more.

Q. How about the slime that hung down in tassels?

A. It is not so bad any more.

Q. Do you know of any cases of typhoid fever among the fishermen along the Illinois river since the opening of the drainage canal?

A. No sir, I don't remember of a fisherman having typhoid fever.

Q. Do you ever engage in cutting ice on the Illinois river?

A. Yes sir, I cut ice nearly every winter for a week or so here at the mouth.

4896 Q. Would the ice that you cut be of Illinois river water?
A. Yes sir.

Q. Is there any difference in the appearance of the ice since the opening of the drainage canal?

A. I couldn't say whether there is or not; I couldn't distinguish any difference.

Q. Does it seem to you to be about the same since as before the opening of the drainage canal?

A. Yes sir, it looks that way to me.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Your opinion is based altogether on the appearance of the water?

A. Yes sir.

Q. And of the ice?

A. Yes sir. In the winter the water is generally clear and I couldn't tell any difference.

Q. Did you fish in this scum, in under the scum that formed on the river?

A. Yes sir, we have fished under there, but it used to be when the water would get low and dead and stagnated, we could not fish under there, because the current wouldn't hold our nets up but we can fish in there now any time. There is always a current in there and it keeps our nets straight; 4897 the kind of nets we fish with are a little different from what they fish with up the river; we have to have a little current to hold the net out; the nets we fish with are called a buffalo net; a set net; it takes no stake to hold them out now; we always have a current along there and it holds the net out straight.

Q. There is a great deal more current then now than there was formerly?

A. Oh yes, yes sir.

Q. Is that true as far up as you have gone?

A. Yes sir, we always have a current in there now,—only when the Mississippi is the highest and backs it up—we have a current in there. If the Mississippi rises rapidly it backs that river up at the mouth.

Q. You say you live here in Grafton?

A. Yes sir.

Q. You have a cistern at your house?

A. No sir.

Q. A living well?

A. No sir.

Q. Where do you get your water?

A. We get the water out of a well but I haven't any myself.

4898 Q. And you don't use the river water?

A. Only when I am on the river working.

DANIEL L. HEATH.

4899 Grafton, Ill., July 14, 1903.

GEORGE SEIK,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. My name is George Seik; Grafton, Illinois; my occupation is a fisherman.

Q. How many years have you been a fisherman?

A. Been a fisherman since 1892.

Q. During that time have you fished in the Illinois river?

A. Yes sir, I have fished in the Illinois river every spring.

Q. What was the condition of the water in the Illinois river before January of 1900?

A. Of course I couldn't make no dates; prior to any year; but prior to the drainage canal I could.

Q. Well, that is the time.

A. The water in the summer time was a good deal like a pond; the current would leave it, and a green scum would come over it a good deal like a pond; of course when we had a heavy raise, there would be a good deal of current in the river.

4900 Q. Did the water smell?

Objected to as leading.

A. Yes sir.

Q. What kind of an odor?

A. Why it smelled like stagnated water in the summer time; the water never smelled in the spring of the year, but when it had this green scum on it it smelled like a stagnated pond; can't tell just exactly the odor.

Q. What was its color?

A. Well the water had a kind of a milky color, as near as I can tell.

Q. Did you use it to drink before the drainage canal was opened?

A. Yes sir, in the spring and fall we drank it right along, and in the summer time we wasn't in the Illinois very much in the hot weather and if we should happen to be there and had no water, we would drink it then, but not as much as we did in the spring and fall.

Q. How did the water act upon the nets before the opening of the drainage canal?

A. Why, I don't know as it acted any different before than it does after.

Q. As to slime and moss on the net?

A. Why, in the fall of the year there would be moss on the nets.

4901 Q. Since the opening of the drainage canal, what has been the condition of the water?

A. Why, since the opening of the drainage canal there has been more current in the river than there was before, and therefore I think the water is purer than it was before.

Q. Is it better to drink?

A. Why, I don't know that it is any better to drink; the water tastes cool, and it must undoubtedly be better to drink because there is more current in the river; it is a purer water, is what I mean by it; it is a pure water.

Q. How about the moss upon the nets since the opening of the drainage canal?

A. Why, since the opening of the drainage canal I haven't fished any more in the Illinois river in the fall of the year. So I can't say whether the moss is as bad or not.

Q. Is the water in the Illinois river a different color since the opening of the drainage canal?

A. Well, I haven't paid much attention to the color of the water, but the color of the water is different; it raises and when the river falls, you know, it makes a difference in the water, now whether it is the drainage canal or not I don't know.

Q. But it is a different color?

A. Oh, it differs in color, yes, sir, as it raises—as the river raises it muddies up and as the river falls it clears up 4902 some, but whether that is the fault of the canal or not I don't know about that.

Q. Have you engaged in cutting ice in the Illinois river?

A. No, sir.

Q. How far up the river are you acquainted with the fishermen?

A. Why, I have fished from 12 mile Island down—twelve miles up the Illinois river.

Q. About how many fishermen do you know who fish upon the Illinois river?

A. Why, I don't know, but four or five above here, only from our own place; of course I know all from my own place.

Q. How many altogether?

A. I can't tell the exact number, but twenty or thirty anyhow.

Q. Do you know of any typhoid fever among the fishermen?

A. I do not.

Q. Do you know whether in the last three years there has been any typhoid fever among the fishermen?

A. I do not; I haven't heard of any.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. What is typhoid fever?

A. I don't know what it is; its typhoid pneumonia; I don't know what it is caused from; I have heard of it; it's a bad 4903 cold that settles on the lungs, I think is typhoid pneumonia; I don't know what it is; I am not posted on the disease whatever. As I said, I didn't know of anyone having it.

Q. What do you mean by pure water as testified to by you here a moment ago?

A. Pure water,—a clear running stream I think is pure water.

Q. You live here in Grafton, do you?

A. Yes, sir.

Q. Man of family?

A. Yes, sir.

Q. Have you a well at your house?

A. No, sir.

Q. Do you use well water?

A. We use cistern water most of the time.

Q. Cistern water?

A. Yes, sir.

Q. You don't use the river water?

A. Not all the time; only when I am on the river I use it, in the spring and fall.

Q. You say there is considerably more current in the Illinois river now than there was prior to the opening of the canal?

A. Yes, sir; there is more current; the current lasts longer; more regular current the year around than there was before.

4904 Q. Did you ever have the diarrhea?

A. I have had it some, yes, sir.

Q. How often?

A. I couldn't tell you; it has been so long since I have had it.

Q. You have had it, though?

A. Yes, sir.

Q. Do you know of any other fishermen having it?

A. No, sir.

Q. Never heard them complain?

A. Never heard them complain.

Q. So, when you say pure water you mean clear water?

A. I don't exactly mean clear water.

Q. Clear running water?

A. Yes, sir; I don't exactly mean running water; we are talking about the Illinois.

GEO. SEIK.

4905 Grafton, Illinois, July 14, 1903.

ALBERT FREIMANN, called as a witness in behalf of the defendants, being first duly sworn, was examined in chief, by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. My name is Albert Freimann; I live at Grafton; and follow fishing.

Q. How long have you been a fisherman?

A. Nineteen years.

Q. How many years did you fish in the Illinois river before the opening of the drainage canal?

A. Why, I fished from 1885 to 1900, about 15 years, 1884 it was.

Q. With nets?

A. Yes, sir.

Q. What was the condition of the water in the Illinois river before 1900?

A. Why, when it would get down low it would be kind of stagnant during the summer season.

Q. What was its color?

A. Why, as a general thing when it got down low it was a kind of a dark black; it was clear when there was no raise from head waters.

4906 Q. What kind of a smell, if any, did it have?

A. Why, in that condition it smelled like a pond or an inland lake.

Q. What effect did it have upon the nets?

A. Well, I don't know as it would have much effect on nets, only just from the moss and stuff that growed in there at that time, it would get on them when it floated down the river.

Q. Did you drink it?

A. Yes, sir; we did in cool weather.

Q. Since the opening of the drainage canal, what has been the condition of the water?

A. Why, the water seems to be much purer than it was. More current, I suppose, 'is the reason of it.

Q. Do you drink it since the opening of the drainage canal?

A. During the cool weather, yes, sir.

Q. What is its color, is it lighter or darker than before?

A. Why, it seems like it is a kind of a milky like color.

Q. Do the fishermen on the Illinois river so far as you know, generally drink the water when fishing upon the river?

A. Yes, sir; in cold weather all the fishermen that I know of drinks it.

Q. Do they have typhoid fever?

A. None that I know of.

Q. Have you engaged any in cutting ice?

A. Yes, sir.

4907 Q. Both before and since the opening of the drainage canal?

A. Yes, sir; cut ice every winter that they cut it here, for over twenty years.

Q. If there is any difference in the appearance of the ice before and after the opening of the drainage canal, tell what it is?

A. Why, I don't know as I notice any difference.

Q. Does moss gather on your nets since the opening of the drainage canal?

A. It hasn't as yet.

Q. How far up the Illinois have you fished?

A. Fifteen miles.

Q. How many seasons have you fished up as far as that?

A. Why, I fished part of every season that I have been a fishing.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say the water is clearer now than before the opening of the canal?

A. Well, it isn't exactly the same color as it was; it was a kind of a dark black color before the opening of the canal.

Q. The ice is the same color?

A. Well, I never paid much attention; you know when 4908 you would be on the ice cutting or in the house storing, you wouldn't pay much attention to that. I never examined that thoroughly; I don't know as you could notice any difference in it though.

Q. I understand you to say that before the opening of the canal the water was of a rather dark color?

A. Yes, sir.

Q. Now, what was it since the opening of the drainage canal, a kind of a milky color?

A. Kind of a milky like color; looked like you might take a drop or two of milk and drop it in a glass of clear water, just changed about that much from clear water.

Q. You live here in Grafton?

A. Yes, sir.

Q. Married man?

A. Yes, sir.

Q. Do you have cistern water?

A. No, sir; well water.

Q. Living well water?

A. Yes, sir.

Q. You don't use the water from the river then up at your house?

A. No, sir.

Q. You only use the river water when you are out fishing?

A. Yes, sir.

4909 Q. And that is because you can't get anything else?

A. I could take it with me.

Q. What do you mean by pure water as testified to here by you?

A. Why, water fit to drink, healthy, I suppose, would be pure water.

Q. What do you mean by water that is fit to drink?

A. That there is no sickness created from water that you drink I suppose would be pure.

Q. The fact that there is a current in the river, does that have anything to do with the water being purer now?

A. It seems that since that current has been there it was more pure than it was before.

Q. There was more sickness before than since?

A. It seems that there was more chills and fever it seems like around town than there has been since; outside of that I don't know as there is any more.

Q. What kind of a fever?

A. A kind of an ague fever, I guess.

Q. It wasn't typhoid fever?

A. No, sir; not as I know of.

Q. What you mean by pure water then so far as your testimony is concerned, is clear running water in a stream, 4910 judging from its appearance?

A. Well, I judge it from the drinking qualities.

Q. Then you judge its drinking qualities from the appearance of the water?

A. Yes, sir.

A. FREIMANN.

4911 Grafton, Ill., July 14, 1903.

WILLIAM WRIGHT CRANDELL, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. William Wright Crandall; fisherman; residence, Grafton, Illinois.

Q. How long have you been a fisherman?

A. I have been fishing since 1896.

Q. Since that time have you fished in the Illinois river above Grafton?

A. In the spring of the year only—entirely.

Q. What was the condition of the water of the Illinois river before the opening of the drainage canal in 1900?

A. Why, the water was dead; it was stagnated unless we had a head raise.

Q. In what season of the year was that?

A. Why, it generally come in May and run along from May and June to July and August.

Q. What was its color before the opening of the drainage canal?

4912 A. Why, she was dark.

Q. If it had any odor, what was it?

A. Well, I couldn't just say; it wasn't a very pleasant odor; I couldn't define just how it smelled; it didn't have a pleasant smell by no means.

Q. If you fished with nets before the opening of the drainage canal, how did the water affect the nets as to moss and slime?

A. Well, it affected them pretty badly; it covered them all over; it was mostly slime first; it would come on the net and hang down in pieces that long (indicating) and as thick as your finger, and then the moss would come and cover the nets so heavy you scarcely could lift them.

Q. Was the water good to drink?

Objected to as leading.

A. It wasn't so good then; no, sir, it was not.

Q. Since the opening of the drainage canal?

A. Well, within the last two years; I have fished there now in April, and up to that time the water was pure and reasonably clear, with the exception of the leads that would run into it, you know, and in heavy rains.

Q. How about the moss upon the nets?

A. Well, I haven't fished any in the last two years, to tell how the moss would come; it would generally get off in April and doesn't come until that time; that is in the last year or two.

4913 Q. Has there been an odor to the water since?

A. No, sir, not in the spring of the year there hasn't; now, I couldn't say; I haven't drunk any since in April of that water; I haven't been up there and haven't had any occasion to drink it.

Q. Have you engaged in the cutting of ice on the river?

A. Well, no, sir; I haven't cut any ice in fifteen years there.

Q. Have the fishermen on the Illinois river who drink its waters had typhoid fever?

Objected to as leading.

A. No, sir.

CROSS-EXAMINATION, by Mr. Jeffries.

MR. JEFFRIES: I move to strike out the last question and answer, because it assumes that the fishermen on the Illinois river drink the water from that river.

Q. MR. JEFFRIES: Why, wasn't the water just as good prior to the opening of the canal, as it is now?

A. Well, sir, I believe I can explain that to you. You take a spring or pool, if it hasn't an outlet and a stream to flow to it is impure, and before the drainage canal we had no current in the Illinois river at this time of the year; now we have a current there. We have now the last few years all the year around.

4914 Q. Much of a current?

A. Right good current, yes, sir.

Q. What is the difference in the color of the river?

A. Well, before it was dark and now it is a kind of a clear milky color.

Q. You live here in Grafton?

A. Yes, sir.

Q. Man of family?

A. Yes, sir.

Q. Have you a cistern or a living well at your house?

A. I have neither one at my place.

Q. Do you use well water?

A. Yes, sir.

Q. You don't use the river water at your house?

A. No, sir.

Q. Your family doesn't use it?

A. No, sir.

WILLIAM W. CRANDELL.

4915 Grafton, Illinois, July 14, 1903.

CHARLIE JONES, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. Charlie Jones; I generally fish for a living.

Q. You live in Grafton?

A. Yes, sir.

Q. How long have you been a fisherman?

A. About ten years.

Q. During that time, how much have you fished on the Illinois river?

A. Well, I have fished there more or less every year.

Q. What was the condition of the Illinois river before the opening of the drainage canal?

A. Well, it was generally dead water; stagnated water, you might call it.

Q. What is its condition since?

A. Why, there is generally a good current there and it throws off all of that green scum and things of that kind.

Q. What was its condition as to depositing moss on the nets before the opening of the drainage canal?

4916 A. Well, it generally used to take a net up there before the opening of the drainage canal, there was no current you know, and there was a kind of slime and sediment all over it. Since that there hasn't been so much of it.

Q. What was the color of the water before and after the opening of the drainage canal?

A. Well, I don't remember exactly what color it was.

Q. Which time was it best to drink?

A. Well, generally during cool weather.

Q. Before or after the opening of the drainage canal?

A. Well, we generally always drank it in cool weather—well I don't know as it made much difference.

Q. Have you engaged in putting up ice both before and since the opening of the drainage canal?

A. Yes, sir.

Q. If there was any difference in the appearance or quality of the ice after the opening of the drainage canal as compared with before, tell what it was?

A. Well, you generally take where there is a current there is bound to be purer water; bound to make better ice, better to drink.

Q. Did the water have any smell before the drainage canal?

4917 A. Yes, sir, it had.

Q. Has it had any since?

A. No, sir, none that I have noticed.

Q. Do the fishermen on the Illinois river have typhoid fever?

A. No, sir; none that I know of.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Are you a married man?.

A. Yes, sir.

Q. You live here in Grafton, do you?

A. Yes, sir.

Q. Do you use well or cistern water at your home?

A. We use well water.

Q. You don't use river water?

A. No, sir, I don't know as it comes from the river; not very far from the river, couple of hundred yards, I suppose.

Q. Well, I mean you don't take it out of the river?

A. No, sir.

Q. What did you say was the color of the Illinois river water prior to the opening of the canal?

4918 A. Well, I don't know exactly what the color of it was; I never paid much attention to it.

Q. You don't know what the color was?

A. No, sir; it was kind of milky.

Q. When you speak of the difference between the water in the Illinois river now and what it was prior to the opening of the canal, what do you mean?

A. Well, I should judge it would be better to drink; that is, it would be purer; there was a current to drive that stagnated water off, that slime, and so forth.

Q. From that you base your opinion?

A. Yes, sir.

Q. It is just merely an opinion of yours, is it?

A. Yes, sir.

Q. There is considerable more current now than there was?

A. Yes, sir.

Q. In fact, you said a moment ago there was no current before the opening of the canal?

A. No, there was no current before the opening of the drainage canal; since that there seems to be more current.

CHARLES JONES.

4919 Grafton, Illinois, July 14, 1903.

THOMAS COCKSHOTT,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Thomas Cockshott; Grafton; fisherman.

Q. How long have you been a fisherman?

A. Been fishing for twenty years.

Q. How much of that time have you fished upon the Illinois river with nets.

A. I fished every season; that is for the season; in the spring; sometimes in the summer; I have fished every season.

Q. What was the condition of the water of the Illinois river before and after the opening of the drainage canal?

A. Well you take it before the drainage canal, after the spring raise it was dead; take it along in the summer season after it got down; it was dead; kind of stagnated; now there is a good deal of current in it and there has been for the last three years.

Q. What was its color before and after the opening of the canal?

4920 A. Well it is a different color; whenever it comes a raise, a dirty color; whenever it comes a raise out of the head waters of these creeks, it is muddy and dirty.

Q. Which time has it been generally clearer, before or after the opening of the drainage canal.

A. Take it when its down; take it when it is low.

A. Well it is clearer now than it was then; there is more the color of lake water in it when there is no raise.

Q. Did you drink it before the opening of the canal?

A. Yes sir.

Q. Did it have any smell?

A. Well in hot weather, when it was warm it was pretty tough to drink. We drank it when it was cool in the spring; but when it turned warm we didn't drink it; we took water with us.

Q. Have you drank it since the opening of the drainage canal.

A. Yes sir.

Q. Is it better to drink now than before the opening?

A. I guess it is; it is clearer.

Q. How about moss upon your nets before the opening of the canal?

A. Well it was worse then than it is now; you see that moss up there was so bad we couldn't fish at all when that river was dead.

4921 Q. Have you engaged in putting up ice?

A. Yes sir.

Q. Can you tell any difference in the color or appearance of the ice before and since the opening of the drainage canal?

A. I believe it is clearer now than it was then—the ice.

Q. Have the fishermen upon the Illinois river had typhoid fever either before or since the opening of the drainage canal?

Objected to as leading.

A. None that I know of.

CROSS-EXAMINATION.

By Mr. Jeffries.

Q. What do you mean by dead water?

A. Why, stagnated, dead water; no current.

Q. That is the way it was before they opened the canal?

A. Yes sir, there is always a current here now with the exception of a raise in the Mississippi when we had the back water.

Q. The difference between the water prior to and since the opening of the canal is that prior to the opening of the canal it was a black color or dark color while now it is a milky or white color?

A. Why you take it when it was down and no raise in it, it looks more like lake water.

Q. Did you ever live on a lake?

A. No sir I never lived on the lake; I never lived no-
4922 where only around here.

Q. Have you ever been on the lake?

A. No sir.

Q. Did you ever see the lake?

A. No, no big lakes.

Q. What lakes did you see?

A. I have seen the lakes around through the timber here.

Q. How large is the biggest lake you ever saw?

A. I saw one across here four or five miles long, when a good stage of water in it.

Q. Is it always that way?

A. A dry season it dries up more or less.

Q. And it resembled the water in those lakes, then did it?

A. Yes, a kind of a clear water that was in these big lakes; you take a kind of blue—

Q. Don't tell what they say, we are talking about what you know now.

A. Well I heard about it, read about it, a blue cast.

Q. You never saw Lake Michigan?

A. No sir.

Q. Are you a man of family?

A. I ain't a married man, no.

Q. You live here in Grafton?

A. Yes sir, I was born and raised here. Right up here close to the mouth of the Illinois river. 4923

Q. You board here in town do you?

A. No sir, I have a mother; my mother and I live together.

Q. Have you a cistern or well at your house?

A. I have a well, no cistern.

Q. You use the water that is consumed at the house then out of this well?

A. Yes sir.

Q. You don't use the river water?

A. Only sometimes to wash in when it is a right dry season; we don't use it to drink.

THOMAS C[illegible]SHOTT.

4924 Grafton, Illinois, July 14, 1903.

MARTIN GILMORE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:—

Q. What is your name, residence and occupation?

A. Martin Gilmore; I live in Grafton; Fisherman.

Q. How long have you been a fisherman?

A. I have been fishing twelve years now; twelve years last March.

Q. How many years have you fished in the Illinois river?

A. I have fished there ever since I have been fishing, that is off and on; fished there every year.

Q. What was the condition of the water of the Illinois river before the opening of the drainage canal and after the opening of the drainage canal?

A. Why before it was opened at certain seasons the water was dead; there was no current in there; it had a scum on it, but since the opening of the canal there is a pretty fair current in there all the time.

Q. Any scum?

A. No, we never see no scum up there now.

4925 Q. What was the color before the opening of the canal and after?

A. Why at times now when the water is down pretty low it is clearer than it used to be; it looks darker. But when there is a raise in it it looks just the same as ever.

Q. What was its smell before and after the opening of the canal?

A. Well before it was opened there was times there that slime and scum that was up in there smelled very bad when the water was dead and had no current in there. We seined up there one year when there was no current and we couldn't seine over three or four hours; when we would catch any fish we would have to come down here and ice them; they would spoil right away; but since that thing is it seems like the fish live better.

Q. Did you drink the water both before and since the opening of the canal?

Objected to as leading.

A. Yes sir.

Q. At which time has it been best to drink?

A. Well the water seems to be more clearer now than it used to be and it is clearer; we never drink it in right hot weather; but we drink it right along when the weather is cool; now we use ice out of it; we use the Illinois ice right along.

4926 Q. Do the fishermen on the Illinois river have typhoid fever?

A. I never heard of it; I never known of but one fisherman to die around here that I can remember, and he was an awful old man.

Q. Have you engaged in putting up ice both before and since the opening of the drainage canal?

A. Yes sir.

Q. Can you tell any difference in the quality or appearance of the ice?

A. It seems to be just the same only the ice is clearer now than it used to be; there ain't the dirt in it; the ice on this side, there ain't as much drug in it as there used to be. It looks clearer.

Q. When you fish now, do you take water with you in which there is ice from the Illinois river?

A. No we generally take water from home when the weather is right hot, and take the Illinois ice and put in the water.

Q. And drink that water as long as it lasts?

A. Yes sir.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You say there is no channel in the river now?

A. No what?

Q. No channel, current?

4927 A. Why yes, there is a good current.

Q. How was it before the opening of the canal?

A. There was times there was no current unless there was a raise out of it; there is always some current now.

Q. When you say the water is better now than it was before they opened the canal, what do you mean?

A. Why I say it is clearer looking.

Q. It isn't stagnant?

A. No it ain't stagnant.

Q. It is running?

A. It is running water now.

MARTIN GILMORE.

4928 Grafton, Illinois, July 14, 1903.

WALTER RICHEY,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Walter Richey.

Q. What is your business?

A. Fisherman.

Q. Where do you live?

A. Grafton.

Q. How long have you lived in Grafton?

A. Twenty-two or three years, 23 years I think.

Q. How long have you been engaged in the fishing business?

A. Fourteen years.

Q. Are you acquainted with the Illinois river?

A. Well I think so; part of it.

Q. What part of it?

A. From here to Twelve Mile Island.

Q. How far is that from here?

A. Twelve miles.

4929 Q. What was the character of the water of the Illinois river before the opening of the drainage canal in January, 1900?

A. Well, there was a slight current and stagnant like a pond most of the time in the summer and fall.

Q. Was there any scum or odor to the water?

A. Yes, sir; a green scum in low water when the current was slack; there was a bad smell to the mud where the water would flow away from the mud it smelled bad.

Q. What effect did the water have on the fish?

A. I don't think fish lived as well then as they do now.

Q. How do you know that?

A. Because if we put fish in a float-box they didn't seem to live as well; there was no current, and it seemed like they were softer, and they didn't live as well in the nets.

Q. Have you observed any change in the waters of the Illinois river since the opening of the drainage canal and if so state in what respect?

A. Well, I think the water is purer, clearer, more pure than it was; it seemed like where there was a current it was more pure than in a pond or a lake. It is a different color; it used to be the water would get kind of green in low water time.

Q. Does that condition obtain now?

A. I think not; I haven't seen it that way in the last couple of years or so.

4930 Q. What in your opinion has been the effect upon the Illinois river of the turning of the waters of Lake Michigan through the drainage canal into the Illinois river?

A. Well, I think the river is in better shape and I think the water is in better shape; it is more purer than it was.

Q. Have you been in the habit of drinking the waters of the Illinois river since the opening of the drainage canal?

MR. JEFFRIES: We object to the question because it is leading and suggestive.

A. Yes, sir; I always drink the water in the cooler season of the year; we always carry water with us in warm weather.

Q. When you carry water with you, do you carry ice?

A. No, sir; we don't.

Q. About how many fishermen fish upon the Illinois river from Grafton?

A. About 30 or 35, I guess; such a number as that.

Q. During the last two years and a half, or since the opening of the drainage canal, do you know of any of the fishermen having contracted typhoid fever from drinking the waters of the Illinois river?

MR. JEFFRIES: We object to the question for the reason that it is incompetent and immaterial, and irrelevant because it does not tend to prove or disprove the material issue in this case.

4931 A. No, sir.

Q. Do you know of any fishermen having had typhoid fever during the last three years?

A. No, sir.

Q. Has the water of the Illinois river which you drank had any effect upon your health?

A. I think not.

Q. Do you know of any fishermen here having died of typhoid fever?

A. No, sir.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Where do you live?

A. In Grafton.

Q. How long have you lived in Grafton?

A. Between 22 and 23 years.

Q. Are you a married man?

A. Yes, sir.

Q. Do you use the water from the Illinois river at your home?

A. No, sir.

Q. What do you use?

A. Use well water, if I am home.

Q. Your family uses well water?

4932 A. Yes, sir; but they use river water when we are on the river; I live on the river part of the time.

Q. What is the difference between the color of the water now and what it was before the opening of the canal?

A. Why, the water is a little muddy now; it is more muddy when it is raised.

Q. A milky color?

A. Yes, sir; it used to have a kind of a green moss on it.

Q. There was no current in it?

A. No, sir.

Q. You don't know whether that green scum was caused by decaying vegetable or animal matter, do you?

A. I don't know anything about that, only I know there was a green scum on the lakes.

Q. On what lake?

A. Lakes in the Illinois bottoms.

Q. Those are small lakes?

A. Yes, sir.

Q. There is no green scum on it now?

A. I think not.

Q. That is on the water in the Illinois river?

A. Yes, sir.

Q. What do you mean by pure water that you spoke about a few moments ago?

4933 A. Why, running water, water that looks purer; I think it is more pure than water with a green scum or that looks kind of green.

Q. That's your reason for saying it is better water?

A. Yes, sir.

WALTER RICHEY.

4934 Grafton, Illinois, July 14, 1903.

R. A. SAWYER, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. R. A. Sawyer.

Q. Where do you live Mr. Sawyer?

A. I live in Grafton, Jersey county, Illinois.

Q. How long have you lived here?

A. I have lived here ten years.

Q. What is your business?

A. Fisherman.

Q. How long have you been a fisherman?

A. I have been a fisherman ever since I have been in Grafton.

Q. Have you ever fished on the Illinois river?

A. Yes, sir; I fished some on the Illinois river; fish there every spring.

Q. Do you know what the condition of the water of the Illinois river was prior to the opening of the drainage canal and what the condition of the water is today?

A. Well, I think I know a little about it; I am not an expert.

Q. Tell me what you know about it?

4935 A. I think the water is in better condition now than it was before the drainage canal was turned in.

Q. State what the conditions were prior to the opening of the drainage canal and what they are today?

A. Well, before it was turned in, it was like a lake or a pond; it was filled with green scum on the water and a moss all over the shores; and the water was really a dark green, and today the water is clearer and purer looking than it was before.

Q. How does the water compare now with what it did then for drinking purposes?

A. I prefer drinking it now better than then as far as I am concerned.

Q. Do you drink the water?

A. I do when I fish in here; I am fishing in the spring of the year.

Q. Have you ever experienced any ill effects from the drinking of the water of the Illinois river since the opening of the drainage canal?

A. No, sir.

Q. What effect has the water upon fish?

A. Well, in my judgment the fish lives better today when we take a fish out of the net, than they did before.

Q. Will you describe the difference in the water, as you see it today from what it was prior to the opening of the drainage canal? 4936

A. Well, as I said before; before the opening of the canal the water was green and it had a scum on it and a moss in the river, and today the water is clearer than it was, more pure looking.

Q. Do you notice any effect upon your nets?

A. Well, the nets don't form a scum on them like they used to; they used to form a scum on the nets and the moss would get onto them; but now we are not bothered so much with that.

Q. Do you know of any fisherman that died of typhoid fever in the last two years and a half?

A. I never knew but one fisherman to die since I have been in Grafton and he died with the heart disease.

Q. How old was he?

A. He was about 65 or 70 years old.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say you live in Grafton?

A. Yes, sir.

Q. Married man?

A. Yes, sir.

Q. Do you use the river water at your house or do you use well water?

A. No, sir; we use well water.

4937 Q. Why do you say the water is purer now than it was before the opening of the canal?

A. Because it looks purer and clearer when you look at it. Before the drainage canal it was a green looking color and today it looks clearer than it did.

Q. You drank the water both before and after, did you?

A. I have when it was cold, yes, sir.

Q. That is the only way that you have of telling that the water is better now in your judgment than it was before the opening of the canal?

A. Yes, sir; that is the only way I can tell.

Q. Any current there now?

A. Yes, sir.

Q. Was there before the opening?

A. At times there was when we would have a raise, a head raise up the Illinois somewhere. But the majority of the time there was no current in the Illinois; it was more like a lake or a pond.

R. A. SAWYER.

4938 Grafton, Illinois, July 14, 1903.

ALBERT LEE, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Albert Lee.

Q. Where do you live, Mr. Lee?

A. I live here in Grafton.

Q. What is your business?

A. Fisherman.

Q. How long have you been a fisherman?

A. About fifteen years.

Q. Fishing on the Illinois river?

A. Yes, sir; part of the time; most of the time I was fishing on the Illinois and part of the time in the Mississippi.

Q. Were you acquainted with the waters of the Illinois before the opening of the drainage canal?

A. Yes, sir.

Q. Are you acquainted with it since the opening of the drainage canal?

A. Yes, sir.

4939 Q. Describe the water before and since the opening of the drainage canal and give your opinion as to what effect the waters of the drainage canal have had upon the Illinois river?

A. Well, before the canal was opened, the water—when the water would get low in the fall of the year, it would get very stagnated, and the water would get a kind of green scum, and it would smell very bad, and when we were seining, up there in the fall of the year, would be nearly impossible to keep our fish alive; couldn't only keep them alive a certain length of time. Well, since, we have always had a pretty fair current in the river and the water has been more clear, that is except when there would be a rise in the river, but other times it would be more clear and it was better water and more pure.

Q. When you are out fishing, do you drink the water?

A. Yes, sir; I have up to the last few days, but when the weather got so warm then we quit drinking it.

Q. Do you use ice now?

A. No, sir; generally take a jug of water with us, and then when we get up to the club house we generally fill the jug there.

Q. Do you know of any fishermen that died from typhoid fever in the last two years?

A. No, sir; I don't know of but one fisherman that has died in the last twelve years and he died with heart disease.

4940 Mr. Veach.

Q. Do the fish live any better now than they did before?

A. Yes, sir, they do.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say there is some current in the river now?

A. Yes, sir.

Q. Much of a current?

A. No, sir, not so very much; it seems to be slackening off a little now.

Q. No green scum on the water?

A. No, sir.

Q. Was there a current on the river before the opening of the canal when this green scum formed?

A. Part of the time the river was like a lake no current scarcely at all; sometimes there wasn't any current at all; it was just like a lake.

Q. Why do you say the water is better now than it was before the opening of the canal?

A. Why there is a current in the river now and there is no scum on the water now and it doesn't smell, and it is better now to drink than it was; then you couldn't drink it at all and the fish wouldn't live in the water either.

Q. And still you fished in it?

4941 A. Yes, sir.

Q. Do you know what caused that green scum?

A. No, sir, I do not.

Q. You don't know whether it was vegetable or animal matter?

A. No, sir, I couldn't say; I know that it had a very bad smell to it.

Q. You are a married man?

A. Yes, sir.

Q. Live here in Grafton?

A. Yes, sir.

Q. Do you use the Illinois river water for drinking purposes at your home?

A. No, sir, not now we don't, but up to a year ago we did.

Q. You use well water now?

A. Yes, sir.

RE-DIRECT EXAMINATION, by Mr. Todd.

Q. What did you mean by saying that the fish didn't live in the water?

A. Well, it seemed like that the water was so foul when you would take them out, and handling them in putting them in a box or float net, just that little time out of the water would kill them.

ALBERT LEE.

4942 Adjourned at 9 p. m., July 14, 1903, to meet at Hardin, Illinois, July 15, at 9 a. m.

The State of Illinois
and
Sanitary District of Chicago

VOL. 4

IN THE

Supreme Court of the United States

THE STATE OF MISSOURI
vs.
THE STATE OF ILLINOIS
and
THE SANITARY DISTRICT OF CHICAGO.

Original,
Docket No.

Before
FRANK S. BRIGHT,
Commissioner of the Supreme Court of the United States.

VOLUME 4.

A—188

VOLUME 4.

Hardin, Illinois, July 15, 1903. 10:00 a. m. Met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

CHARLES FLAMM, called as a witness in behalf of the defendants, being first duly sworn, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?
A. Charles Flamm.
Q. What is your business?
A. Insurance; insurance agent.
Q. How long have you been in that business?
A. Ever since last fall.
Q. What did you do before that time?
A. County clerk.
Q. For what county?
A. Calhoun county.
Q. Where do you live?
A. Hardin, the county seat.
Q. How long have you lived in Hardin?
4943 A. Nine years; that is off and on for the last thirty years, but I was gone in Richwood precinct, part of this county for a number of years; otherwise I lived here all the time.
Q. Have you been acquainted with the Illinois river at this point for the last ten years?
A. Yes, sir.
Q. How far is Hardin from the mouth of the Illinois river?
A. I don't know exactly, but I think it is about 41 miles.
Q. What is the population of Hardin?
A. About 500.

Q. Have you been acquainted with the Illinois river since you have lived in Hardin?

A. Yes, sir.

Q. What was the character of the water in the river prior to the opening of the drainage canal?

MR. JEFFRIES: I want it understood that the same objection is urged against the testimony of this witness as the witnesses of yesterday.

MR. TODD: Yes, sir.

A. Why, in my opinion it wasn't as pure as it is now.

Q. Describe the water as it existed prior to the opening of the drainage canal, January, 1900?

A. In my opinion—

4944 Q. I want you to describe the river before the opening of the drainage canal?

A. During the low water the river on the east side here was covered with vegetation, and it looked to me as if the water was very impure.

Q. Was there any scum on the water?

A. There was.

Q. Describe it?

A. It was a greenish scum and when you passed through it with a boat it left a trail; you could notice it for sometime afterwards; that is when the river was rather low; low water; that was during the summer months.

Q. What has been the change, if any, made in the waters of the Illinois at this point by the opening of the drainage canal?

A. It has a better current and this scum no longer appears.

Q. Have you drank the water since the opening of the drainage canal?

A. I have.

Q. Did you ever drink it before?

A. No, sir.

Q. About how many fishermen are engaged in fishing at this point in the river?

Objected to as immaterial.

A. Between twelve and fifteen.

Q. Do you know of anyone who had typhoid fever, or who died from typhoid fever in the last two years at this point?

4945 Objected to as immaterial and not competent evidence.

A. No, sir.

Q. What is your opinion as to whether or not the waters of the Illinois have been improved in their quality, and appearance by the addition of the waters of the drainage canal into the Illinois river since January, 1900?

MR. JEFFRIES: We object to this question for the reason that it calls for an opinion from the witness, who has not qualified himself as being competent to judge or form an opinion as to the sanitary condition of water, and for the further reason that any opinion that the witness might have would be based simply on the appearance of the water and not with reference to its sanitary or unsanitary condition.

A. In my opinion from the appearances, it has improved.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Your opinion is based solely upon the appearance of the water?

A. Yes, sir.

Q. And you say that the water is better since the opening of the canal than it was prior to the opening for the reason that the green scum that formed on the water prior to the opening, while it does not form since the opening, and the creation of the current caused by the opening, is that correct?

4946 A. Yes, sir.

Q. You are not a physician?

A. No, sir.

Q. You don't make it a business of looking after the health of your people?

A. No, sir.

Q. Do you use the river water at your home or do you use well water?

A. We use cistern water.

Q. Hardin has no water system, has it?

A. No, sir; only wells and cisterns.

Q. Only wells?

A. That's all.

CHAS. FLAMM.

4947 Hardin, Illinois, July 15.

EDWARD ATHY, called as a witness in behalf of the defendants, being first duly sworn, by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Edward Athy.

Q. Where do you live?

A. Hardin, Calhoun county, Illinois.

Q. How long have you lived here?

A. In this vicinity, in Hardin about twenty years; I moved here in 1880 on Macoupin Island in 1880.

Q. What is your business?

A. I work at carpenter work and joining, and generally anything I can get to do.

Q. Have you been acquainted with the Illinois river since you have lived in Hardin?

A. Yes, sir.

Q. What was the character of the Illinois river prior to the opening of the drainage canal in 1900?

A. Well, I am only qualified to judge by the appearance; but in my opinion the appearance of the water has improved since the opening of the canal.

4948 Q. Just state what the appearance was?

A. Before that time the water was more inclined to be milky looking and muddy looking, and a scum over the river that was noticeable by every one.

Q. Was there any odor to the water?

A. That I cannot say.

Q. What effect would row-boats have on the water when rowing through it?

A. During the time this scum was over the river, it left a clean furrow over the river. I have crossed the river many a time and could see clear across, or half across.

Q. Since the opening of the drainage canal, what effect have you observed to have taken place in the Illinois river?

A. I have observed a more lively current, a better movement of the water and I have observed less of this scummy looking filth on the top of it than before.

Q. What effect, in your judgment, has the opening of the drainage canal had on the waters of the Illinois river at this point?

A. Well, in my judgment—

MR. JEFFRIES: Objected to as calling for an opinion without the witness having qualified as being competent to testify as to the sanitary condition of the water.

4949 A. Well, my judgment is only from appearances, and the water appearing clearer and cleaner, I should say it was purer.

Q. MR. TODD: Have you noticed any odor in the water since the opening of the drainage canal?

A. No, sir.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Are you on the water a great deal?

A. No, sir; not a great deal.

Q. Your opinion is based solely on the appearance?

A. I am not qualified to judge otherwise; only by appearance.

Q. Do you know why there is no scum on the river now?

A. No, I do not know why, I might testify why I think so.

Q. What is it?

A. I think a better movement of the water carries the scum away.

Q. It did not give it an opportunity to form?

A. No.

Q. You don't know whether the sewage matter from Chicago gets down this far or not?

A. No, sir.

Q. Don't know anything about that?

A. No, sir.

4950 Q. About all that you do know then is that in your opinion the waters have been improved by the increased flow caused by the canal?

A. That is my opinion; that it has been improved by the increased flow.

RE-DIRECT EXAMINATION, by Mr. Todd.

Q. And this improvement is what you see and observe of the water now as different from what it was prior to the opening of the canal?

Objected to for the reason that it is leading and suggestive of the answer desired, and for the further reason that the witness has not properly qualified himself to express an opinion?

A. Yes, sir; that is what I thought about it.

Q. Have you observed in the Ilinois river here anything that would lead you to believe that the sewage from Chicago was present in the waters of the Illinois at this point?

Objected to for the same reason.

A. I have not.

EDWARD ATHY.

4951 Hardin, Illinois, July 15, 1903.

NATHANIEL BULL, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Nathaniel Bull.

Q. Where do you live Mr. Bull?

A. Well, I live in Hardin.

Q. How long have you lived here?

A. Six years. I have lived in Hardin.

Q. How long have you lived in the county?

A. Since 1860.

Q. What is your business?

A. Farmer.

Q. Have you been acquainted with the Illinois river for the last ten or fifteen years?

A. Yes, sir; I have been slightly acquainted with it. Not traveling around on the water, but living along the river.

Q. Have you crossed the river?

A. Well a time or two in the last four or five years, gone on the ferry.

Q. Have you seen the river frequently?

4952 A. Yes, sir.

Q. What was the condition of the river before the opening of the drainage canal as you saw it?

A. Well, it was in a condition just the same as a pond, very near.

Q. Well, how is that?

A. Why, there was a scum over it; you could see if anything had passed through it.

Q. Any odor to it?

A. Well, yes.

Q. Since the opening of the drainage canal, have you observed the waters of the Illinois?

A. Yes, sir, when I traveled along by it.

Q. How does the river compare now with what it did then?

A. Well, I never saw none of that to amount to anything on it since. It appears to have a current.

Q. Have you noticed any odor since?

A. No, not any at all, that ever I noticed.

Q. What is your opinion as to whether the river has improved since the opening of the drainage canal?

A. With a good current in the river, it certainly has improved; taking that away and making the water pure.

MR. JEFFRIES: We move to strike out the question 4953 and answer for the reason that the witness has not qualified himself to testify on that subject.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Your opinion is based solely upon the appearance of the water, is it not?

A. Of course it is based upon the appearance of the water; I ain't traveling now any on the river. I used to travel, but I am getting too old now; since the canal was opened.

Q. Do you know why there is no scum on the water now?

A. Better current, I guess.

Q. You never had the water examined by anyone to see whether it contained any deleterious substances?

A. No, I never had it examined; just by the appearance of the water as I passed along by it.

Q. What is the difference in the current now and what it was before the opening of the canal?

A. Well, there is a big difference; it is a better current now and before it was a pond. You could throw a chunk in and it was pretty near as apt to float up stream as it was down.

Q. Do you drink cistern or well water?

A. I drink well water; two years ago we used the Illinois river water, the dry season; I hauled water from the Illinois river.

4954 Q. That was just during the dry season?

A. Yes, sir.

Q. And when you couldn't get any other water?

A. Yes, when I couldn't get any other water; we don't use river water when we can get well water.

NATHANIEL BULL.

4955 Hardin, Illinois, July 15, 1903.

M. E. FISHER, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd, testified as follows:

Q. What is your name?

A. M. E. Fisher.

Q. What is your business?

A. Merchant.

Q. Where is your place of business?

A. Hardin.

Q. How long have you lived here?

A. About 35 years; all my life.

Q. Are you acquainted with the Illinois river?

A. Yes, sir.

Q. How did you get your acquaintance with the Illinois river?

A. By being on it all my life.

Q. Do you fish?

A. Yes, sir, with a hand line.

Q. Will you describe the physical conditions of the Illinois river before the opening of the drainage canal?

4956 A. Well, so long as it was down low and green grass growing in it and scum all over it, it made a smell.

Q. What phenomena did you observe when a skiff went through?

A. It left a track where the skiff went through the grass and scum.

Q. What changes, if any, have you observed to have taken place since the opening of the drainage canal, in the Illinois river?

A. Well, the river is up higher and clearer and a swifter current; better water.

Q. Did you ever drink the waters of the Illinois river before the opening of the drainage canal?

Objected to as leading.

A. Yes, sir.

Q. Have you drank it since?

A. Yes, sir.

Q. Since the opening of the drainage canal?

A. Yes, sir.

Q. Have you an opinion in regard to whether the water is better or worse since the opening of the drainage canal, in the Illinois river?

A. Yes.

Q. What is that opinion?

4957 MR. JEFFRIES: We object to this witness testifying to an opinion for the reason that he has not qualified to express an opinion as to the sanitary condition of water and can only judge from its appearance regardless of whether it contains substances deleterious to the health or not.

Q. Well, I think if they shut it off, it would be low and slimy like it used to be before they turned it in.

Q. My question goes to your opinion as to its condition today.

A. I think it is in good condition here now.

Q. What is your opinion as to whether it is better or worse since the opening of the canal than it was before?

A. Well, better, the river is clearer and swifter current.

Q. About how many people at this point are engaged in the fishing business?

A. Well, about ten or twelve.

Q. Do you know of any deaths from typhoid fever in this locality?

A. No, sir.

Q. Are you acquainted with all the people in this town?

A. Yes, sir.

Q. Everybody knows each other here and each other's business, do they?

A. Yes, sir.

4958 CROSS-EXAMINATION, by Mr. Jeffries.

Q. You are a man of family, are you not?

A. No, sir.

Q. Single man?

A. Single man.

Q. Do you board?

A. No, I live with my mother.

Q. Do you have a well or cistern at your house?

A. Cistern.

Q. You don't use the river water?

A. No, sir.

Q. There is no water system in this town is there?

A. No, sir.

Q. You made no examination of the water in the Illinois river prior to or since the opening of the canal?

A. No, sir.

Q. So that all you know about the water is what you get from its appearance?

A. Yes, sir.

Q. How much more current is there now than there was prior to the opening?

A. I couldn't say; it looks like double; it has increased it since double.

4959 Q. Very much more?

A. Yes, sir.

Q. You don't know whether the water contains deleterious substances now or not, do you?

A. No, sir.

Q. To what extent do the people in this town use well water or cistern water?

A. Use it altogether, well or cistern water.

M. E. FISHER.

4960 Hardin, Ilinois, July 15, 1903.

ABNER POOR, called as a witness in behalf of the defendants, being first duly sworn, by the Commissioner, was examined in chief by Judge Johns and testified as folows:

Q. What is your name, residence and occupation?

A. Abner Poor; I live here in Hardin, and fish for a living.

Q. How long have you been a fisherman?

A. About 28 years.

Q. How much of that time have you fished in the Illinois river?

A. All the time with the exception that when it would get so low here I couldn't fish here, I would go over to the Mississippi.

Q. Did you fish here in the Illinois river prior to 1885?

A. Yes, sir.

Q. What was the condition of the river then with reference to the stage of water and the character and quality of the water?

A. Well, the river then along in the summer and fall, I don't know what you would call it, but I would call it poison, more poison than water, there was a green scum in it; no current in it nor nothing. You could put a net in the water 4961 and raise it up you know and it would just be hanging in tags.

MR. JEFFRIES: I move to strike out the answer as not being responsive to the question, and as being indefinite, and the witness not being qualified to express an opinion, and the answer shows on its face to have been recklessly given.

Q. JUDGE JOHNS: Were you aware that in 1885 the city of Chicago pumped its sewage into the Illinois and Michigan Canal?

A. No, not in 1885.

Q. And continued that until 1900?

A. No, I don't know anything about that at all.

Q. Prior to the year 1900, at this point did you notice any substantial difference in the character and quality of the Illinois river water?

A. Why, the water is more pure and better now than it was in 1885, at this time of the year it has been in the last two years. I know the water is better now than it was then.

Q. Before 1900, for fifteen years, you may state whether the water in the Illinois river was substantially always in the same condition?

A. About the same, yes.

Q. What was that condition?

A. Well, it was low, no current and most awful dirty and nasty.

Q. From what did the dirt and nastiness come?

4962 A. Well, it just come from the stagnated water, as far as I know; it couldn't come from anything else but the stagnated water, that I know of; it was just like one of these ponds.

Q. That was the condition in low water?

A. Yes, sir.

Q. Before the drainage canal in the winter, what was the condition of the water under the ice when the river was frozen over?

A. Why, if you cut a hole in the ice a kind of a nasty green scum would come up in that hole, and you would pull a net up and it would just be tags hanging all over it.

Q. What kind of stuff composed this black tags?

A. Why, it was filth, is all I could tell you, from the dead water.

Q. Did the fish die under the ice?

A. Yes, lots of them.

Q. Did you drink the water before the drainage canal was opened?

A. I have drank it ever since I have been a fishing; I never pretend to take spring water or well water with me at all.

Q. What was the color of the water before the opening of the drainage canal?

A. Well, it looked something like pond water; kind of a
4963 green scum on it.

Q. How did it smell?

A. Well, I will tell you; I didn't smell it any; as far as that is concerned, only when I would be seining and pulling the seine where it was shallow and this grass growing in it all rotten, it smelled pretty bad there.

Q. Would the fish that you caught live a considerable length of time in live boxes?

A. No sir, they would not.

Q. Since the opening of the drainage canal, what has been the condition of the river?

A. Well the water has been more pure and it tastes better too.

Q. Have you drank it since the opening of the canal?

A. Drank it all the time in the summer; in the winter too when I am on the river.

Q. How about moss and filth in the river?

A. We don't have any more since that.

Q. How about the odor of the water, the smell?

A. Well we don't smell it any more; the current takes off the filth and stuff.

Q. How about grass and weeds in the river now?

A. We don't have any grass and weeds in the river now;
we have a stage of water now that covers those places deep
4964 enough until that grass don't grow. I have seen the
grass from this little Tow Head, the foot of that, clear
to the foot of that Diamond Island up yonder, that you couldn't row a boat through it to save your life; through the grass and moss and stuff.

Q. How much distance is that?

A. Well it is something over a mile and a half. A little fraction over a mile and a half.

Q. Does that condition exist now since the drainage canal was opened?

A. No sir, it does not. It wasn't only this one place but it was everywhere where the water was shallow that it would grow.

Q. This smell that you notice in the water in the summer and under the ice in the winter, was it about the same kind of a smell?

A. Yes sir, it was later on, that is in 1880 and 1885 and along up through there, about one thing all the time in the winter time.

Q. Was it the same kind of a smell, winter and summer?

A. Just about the same; of course it was a little ranker in the summer than it was in the winter.

Q. How far up and down the river have your fishing operations extended?

4965 A. From Twelve Mile Island to Kampsville; I have got nets in the river now within two miles of Kampsville.

Q. How great a distance is that by river?

A. Well, it is about sixteen miles.

Q. Do the fishermen on the Illinois river have typhoid fever?

A. I never knowed one to have it. As a general thing, the fisherman is the hardiest thing there is along the river.

Q. Do the fishermen generally when engaged in their business drink the river water?

A. Yes, the majority of them does; that is I can say that much for the fishermen around here; none of us carries water with us no matter how far we go.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How far is it from here to 12-Mile Island?

A. About eight miles, I guess, or close to it?

Q. How far is it to Kampsville?

A. Well it is about eleven miles by road and about ten by the river.

Q. Then your fishing trips have made you acquainted with the Illinois river for a distance of about 18 or 19 miles?

A. Yes, somewheres along there.

Q. How long did you say you have been fishing?

4966 A. I have been fishing for 28 years, right here.

Q. How old are you?

A. Sixty-one.

Q. You say before the opening of the canal there was a green scum on the water?

A. Yes sir.

Q. Where is that scum now?

A. Well, by gosh, that is more than I can tell you; I ain't been watching it to see where it went.

Q. How much of a current is there in the river now?

A. Well I couldn't tell you how fast the current is running; I know it is more than it was in 1885.

Q. More than it was in 1899 before the canal was opened?

A. Yes sir, of course we have got more.

Q. You don't know anything about the water other than from its appearance?

A. Well I can tell you one thing about it, we had no current at all before that, at this time of the year, when the water was low no current here, and when a skiff would get loose here it was just about as apt to go this way as that way.

Q. Just about as apt to go up stream as down stream?

A. Yes sir, just like this spring when the Mississippi was backing the river up.

Q. Do you live in a boat-house?

A. No sir.

4967 Q. You are a married man?

A. Married man, yes sir; got my own property here in the town; I live here in the town.

Q. You have a cistern or a well at your house?

A. Got a well, yes.

Q. What do you mean when you say the water in the Illinois river is better now than it was prior to the opening of the canal?

A. Why for the simple reason it tastes better now.

Q. Better fishing now than there was then, isn't there?

A. Yes.

Q. The water is deeper and more of it?

A. Yes, and there is one other little thing I would like to tell you about it too; you can take—compared to this canal being let in this river—you could take and dip up a tin cup full of water and let it set and there would be a thousand little worms in it. That is more of it. Just like you get in one of these ponds, and dip it up, like wiggle-tails.

Q. That is not the condition now?

A. No sir.

Q. Do you do anything else besides fish?

A. Nothing at all.

Q. You make that your livelihood?

4968 A. I make my living at fishing.

RE-DIRECT-EXAMINATION,

By Judge Johns.

Q. Before the opening of the drainage canal, how long in the summer would the fish live in live-boxes?

A. Why they wouldn't live 24 hours here.

Q. Since the opening of the canal, how long do they live?

A. Well you can keep them four or five days; I have kept them that long last summer.

Q. Do the fish seem stronger and hardier?

A. They are more livelier and appear better; they have got more life about them than they had before—and there is more of them too.

ABNER POOR.

4969 Hardin, Illinois, July 15, 1903.

DR. P. C. BARRY,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. I reside in Hardin; my name is P. C. Barry; I am a retired practicing physician.

J. How long did you practice medicine in Hardin and vicinity?

A. Over thirty years.

Q. How long since you have retired from the practice?

A. I have retired from active practice; about four or five years; but am still doing office practice; some practice in my office.

Q. When you were in active practice how much of territory along the Illinois river did you cover?

A. Well, I covered sometimes about 30 miles south of Hardin and about fifteen miles north of Hardin.

Q. During that time were you familiar with the character and quality of the water of the Illinois river?

A. I paid no attention to that.

Q. Did you know its general condition?

4970 A. Yes sir, I had an idea of its general condition?

Q. Describe its general condition prior to the opening ot the drainage canal?

A. Well, it seemed to be, in summer time,—well there seemed to be a scum over the river in the summer time and there was no current in the river and even in the best season of the year you could smell it; there was a sort of a stench on it, and the water did not appear to be clear; the water appeared to be muddy.

Q. To what did you attribute that stench?

A. Well I attributed it more to the decayed vegetable matter in the river, and the washings from these creeks along the river.

Q. Was there much vegetation in the river itself?

A. Yes sir, in the river sometimes the water was low; there was some grass that could be seen right over the surface of the water.

Q. Do you know whether in the winter prior to the opening of the drainage canal, when the river was frozen over, there was a smell in the water?

A. I couldn't say.

Q. Since the opening of the drainage canal what has been the general character of the water?

A. Well, it seems to be clearer and purer. In fact
4971 the people consider the water better a good deal than it
has been before that time.

MR. JEFFRIES: I move to strike out the last part of the answer which has reference to what the people consider.

Q. How do you consider the water now as compared with the time before the drainage canal was opened?

A. I consider the water purer and healthier for consumption by the people.

Q. Prior to the opening of the drainage canal, did the people drink the river water?

A. Very little to my knowledge.

Q. Did the fishermen drink it?

A. Not that I know of.

Q. Since the opening of the drainage canal do the people drink the water, and especially the fishermen?

A. Well, I don't know for certain; I have drank the water myself; I don't know about the fishermen. I don't know for certain; there has been water from pumps along the river.

Q. Do you consider that that water is largely river water seeped into the wells?

A. Why yes I consider it all river water of course.

Q. What has been the condition of the people in this community as to typhoid fever?

4972 A. Well to my knowledge we have had no case of typhoid fever here; we have had cases of typho-malarial fever.

Q. Do the fishermen have typhoid fever in this vicinity?

A. Not that I know of.

Q. Have you practiced medicine among them as well as among the people not fishermen?

A. Yes sir.

MR. JEFFRIES: We object to the question and answer for the reason that the witness disqualified himself from testifying in that respect when he said that he had retired from practice about four years ago.

JUDGE JOHNS: From active practice.

Q. While you were in the active practice of medicine, did you practice as much among the fishermen as well as among the people not engaged in that business?

A. Why yes, if they happened to get sick, I generally doctored among them as well as others.

Q. While you were actively in practice were you a man in—or having a considerable proportion of the business in the community?

A. I generally had the largest practice of any physician in Hardin in those days.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How old are you doctor?

A. Sixty-two years old.

4973 Q. Where did you study medicine doctor?

A. I studied partly at the University of Louvain, Belgium, and partly Pope's Medical College, St. Louis.

Q. When was that?

A. That was in 1865 and 1866; during the cholera time in St. Louis, I happened to be there then.

Q. I understood you to say a while ago in answer to a question from Mr. Johns that you knew nothing about the Illinois river except from its appearance; in other words you never made any examination of the water or anything of that kind?

A. No, I didn't make any examination of the water except that I used it; drank the water just when I needed it. No question then about the water, about this germ theory or anything at that time.

Q. How is that?

A. There was no question then about germs or bacilli then, in those days, you know.

Q. That theory has been—

A. Has come up since that time.

Q. There is no water system here in Hardin?

A. No sir.

Q. The people use wells and cisterns?

A. They use wells and cisterns.

4974 Q. What is the difference in the flow of the water now and what it was prior to the opening of the canal, doctor?

A. The current is swifter now, a great deal more so than it was earlier, before 1900.

P. C. BARRY.

4975 Hardin, Illinois, July 15, 1903.

CHARLES H. LAMAR,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. Charles H. Lamar; Hardin, Illinois; editor and publisher of a newspaper.

Q. What is the title of the newspaper?

A. The Calhoun Herald.

Q. How long have you resided in Hardin?

A. Eight years the first of April; going on nine years.

Q. How long have you lived upon or in the vicinity of the Illinois river?

A. My life time, forty years.

Q. Where before Hardin?

A. Three and a half miles north of Hardin, about one mile west of the river.

Q. Have you been familiar with the general character of the Illinois river during your life?

A. I think I have, yes sir.

Q. Have you fished or hunted upon it?

A. Yes sir.

4976 Q. How much?

A. From boyhood; I don't think there has been a year passed but what I have had occasion to fish and swim and hunt around the river.

Q. Prior to the opening of the drainage canal in 1900, what was the general character of the water in the Illinois river?

A. Well, we had less water; not so rapid a current and at times stagnant; in low water it was very much so; considerable vegetation found in the river.

Q. Did it then have an odor in the summer?

A. Yes sir.

Q. To what did you attribute the odor?

A. Well to the grass growing out in the river and to the green scum found upon the water.

Q. Do you know whether in the winter when the river was frozen over, there was an odor to the water under the ice?

A. No sir.

Q. Did you have a general acquaintance with the people residing upon the river prior to the opening of the canal?

A. Yes sir.

Q. Did they use the water for drinking and domestic purposes?

A. Well some did when they couldn't get any other; I know I did in my boyhood days, I lived on the river, a farm there, and we had to use the water.

4977 Q. If you know of any difference in the color of the water, before and since the opening of the drainage canal, describe it?

A. Well I think the water now is clearer; it looks fresher.

Q. Do you know as to the—do you know in a general way as to the quality of the fish, before and since the opening of the canal?

A. Only from my conversation with fishermen, they all informed me—

MR. JEFFRIES: We object to what any fishermen told me.

A. They informed me that the fish was better; remain alive longer.

Q. Do the people along the Illinois river so far as you know, who use this water, have typhoid fever?

A. I don't know of a case of typhoid fever from the using of the water.

Q. Was that so as well before as after the opening of the drainage canal?

A. Well, I can't say; I don't know of any cases of typhoid prior to the opening or since, no.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You have never examined the water have you?

4978 A. No, only in a casual way; by rowing on it or bathing in it.

Q. Well, what you say in reference to it is obtained simply from observation?

A. Yes sir.

Q. Do the people here in town—do they drink well or cistern water?

A. Yes sir.

Q. Use it in their homes?

A. Yes sir.

Q. You do?

A. Yes sir.

Q. So the river water is not used for domestic and drinking purposes?

A. Not by the people of the town, no sir.

CHAS. H. LAMAR.

4979 Hardin, Illinois, July 15, 1903.

G. A. WILLIAMS,

called as a witness in behalf of the defendants being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. State your name, residence and occupation?

A. G. A. Williams; Hardin, Illinois; physician.

Q. How long have you been a practicing physician?

A. I have been practicing about 28 years.

Q. How much of that time at Hardin, or upon the Illinois river?

A. About 22 years at Hardin.

Q. Have you been engaged in the general practice among the people?

A. Yes sir.

Q. Of what school of medicine are you?

A. The regular.

Q. Have you been familiar with the condition of the water of the Illinois river in a general way?

A. Fairly, yes sir.

Q. Prior to January, 1900, what was the condition of the water in the Illinois river, as to current, color and odor?

A. Well it wasn't near as good as it is at the present.

Q. Was the water at times stagnant?

A. Yes sir.

4980 Q. During the summer, did it have an odor?

A. Yes, sir.

Q. To what did you attribute the odor?

A. To the stagnant condition and on account of no current I suppose, and the stagnant condition; the film and the scum that was on the river.

Q. Did the odor arise from decaying vegetation or from sewage?

A. I think it was decaying vegetation and perhaps sewage too.

Q. Since the opening of the drainage canal, what has been the condition of the river as to color, current and odor?

A. Well, it is much better at the present time than it was before it was opened, much improved.

Q. Do the people living upon the river use the water for domestic purposes and drinking?

A. I think they do to some extent.

Q. Prior to the opening of the drainage canal, what was the condition as to typhoid fever among people living along the river?

A. There seemed to be a good deal.

Q. Since the opening of the drainage canal, what has been the condition as to typhoid fever?

A. We don't have any cases, at least, I haven't had any.

4981 Q. Are you now actively practicing medicine?

A. I am.

Q. You may state what has been the character and quality of the ice taken from the Illinois river before and after the opening of the drainage canal?

A. Well, I have noticed that it is clearer and better ice since the opening of the drainage canal than it was previous.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long have you been practicing, doctor?

A. About 28 years, may be longer.

Q. The people here in Hardin use well and cistern water, don't they, for domestic and drinking purposes?

A. Well, yes, some do.

Q. What do you mean by "some?"

A. Well, I don't suppose all of them do.

Q. You don't know?

A. I don't know.

Q. A few moments ago, doctor, you said there were a great many cases of typhoid fever along here prior to the opening of the canal?

A. Yes, sir.

Q. How many cases?

A. I couldn't tell you, I didn't keep those numbers.

4982 Q. Well, can you name some of them?

A. No, sir; I can't at present; I have forgotten.

Q. Were there as many as a dozen?

A. Well, I guess there were; yes, sir.

Q. Now, in speaking of the number of cases of typhoid fever prior to the opening of the canal, what was the number of years that those cases covered that you have in mind?

A. I can't say that.

Q. Fifteen or twenty years?

A. I guess that would be about the number, fifteen or twenty years.

Q. And you say there have been no cases whatever since the opening of the canal?

A. Well, I haven't had any. Others may have had typhoid cases.

Q. You say you know of others that had it?

A. I suppose that other physicians had it. I never inquired into their cases.

Q. Was it typhoid fever or typho-malaria?

A. I couldn't say as to that. What do you mean by that question?

Q. I say, was it typhoid fever or typho-malaria, these cases that you spoke of years back?

A. Well, there was some of it genuine typhoid and then some other cases of typho-malaria.

4983 Q. You have never made a chemical, nor a bacteriological examination of the water of the Illinois river?

A. No, sir, I never have.

Q. You know nothing then of its qualities except what you get from observation?

A. From observation, yes, sir.

G. A. WILLIAMS, M. D.

4984 Hardin, Illinois, July 15, 1903

CHARLES E. COOKE, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. State your name, residence and occupation?

A. Charles E. Cooke; Hardin, Illinois; I have several occupations, implement dealer, agent for Eagle Packet Company.

Q. How long have you lived in Hardin?

A. About 19 years.

Q. How long have you been the agent of the Eagle Packet Co.?

A. About fourteen years.

Q. Is that a company running a line of boats upon the Illinois river?

A. Yes, sir.

Q. Were you familiar with the general character of the water in the Illinois river prior to January, 1900, when the drainage canal was opened?

A. Yes, sir.

Q. Describe its condition as to quantity, current, color and odor?

A. There is a great deal more water now than then; 4985 much more current; and no odor at all now.

Q. Was there some odor in the summer prior to the opening of the drainage canal?

A. When the wind was from the east it was very bad, very offensive, that is, in low water.

Q. To what did you attribute that odor?

A. Well, I couldn't say, unless to the river itself.

Q. Whether it was from decaying vegetation, grass and weeds in the river, or from sewage, could you tell?

A. It came from the river; that's all I know.

Q. Is there much ice put up in and about Hardin?

A. Not since the dam was put in.

Q. To what dam do you refer?

A. Kampsville.

Q. Do the people here put it up for their own personal use?

A. They do when they get good ice.

Q. So far as you have observed, has there been any difference in the appearance and quality of the ice since the opening of the drainage canal?

A. When we have got good ice, the ice has been much clearer; that is, when the river was low and we could get good thick ice.

Q. Are you acquainted in a general way with the fishermen and other people in this vicinity who live upon the Illinois river?

A. Considerably so, yes, sir.

4986 Q. What has been the condition of health of the people using river water since the opening of the canal?

A. I don't know of any of them being sick; complaining any, only rheumatism, which is always the case on a river.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Your statement that the water is better now than it was before the opening of the canal is based altogether on its appearance?

A. Well, it is much clearer and there is no smell to it; when the water was low it had no current; the water had a very offensive bad smell in low water before the canal came in.

Q. You don't know whether it contains deleterious substances?

A. I don't know anything about that at all.

Q. You are a man of a family?

A. Yes, sir.

Q. Do you use well water or cistern water at your house?

A. We use well water in the summer; cistern water in the winter.

C. E. COOKE.

4987 Hardin, Illinois, July 15, 1903.

M. J. PARKER, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. M. J. Parker.

Q. Where do you live?

A. Hardin, Illinois.

Q. How long have you lived here?

A. I have lived here since 1873, with the exception of five years, I was on my farm in Jersey county.

Q. Did you ever steamboat on the Illinois river?

A. I didn't myself; I run on the Illinois river for four years.

Q. Between what points?

A. From St. Louis, to Montezuma and part of the time as far as Naples.

Q. How far up the river is Montezuma?

A. Well, it is about 32 miles from here, I think; we call it fifty miles to Naples.

Q. What is your present business?

A. I am in the orchard business—farming.

4988 Q. Have you had occasion to be on the Illinois river during the last four or five years?

A. Well, I haven't been steamboating for the last four years; I quit in 1899.

Q. Since 1899 have you been on the Illinois river in any capacity?

A. No, sir; I have just lived on the river; I have been on the river fishing and hunting a good deal; of course I have been on steamboats quite often making the trip between St. Louis and here.

Q. Are you a fisherman?

A. No, sir; only with a rod and reel.

Q. During the winter are you on the river?

A. No, sir.

Q. Do you hunt on the river?

A. Yes, I hunt on the river every season.

Q. Your fishing and hunting is mainly for recreation?

A. Yes, sir.

Q. Have you observed the condition of the Illinois river before the opening of the drainage canal and since the opening of the drainage canal?

A. Yes, sir.

Q. Will you describe the conditions that existed on the Illinois river prior to the opening of the drainage canal, the condition and character of the water?

4989 A. Well, I notice a decided improvement in the conditions.

Q. No, I asked you to describe the conditions that existed before the opening of the canal?

A. Oh, before the opening of the canal it was a very sluggish stream, and it looked like there was an accumulation of moss and grass and the stench was pretty bad at times, especially in warm weather in low water; the water had a kind of a greenish appearance, and very little current.

Q. Was there a scum on the water?

A. Yes, sir.

Q. To what extent?

A. Well, considerable at times; especially when we had a continued drouth, and low water; it would be a good deal more than it would be in the wet season; when the water was coming in from the draw, that is after heavy rains, it would clear it up considerable.

Q. What are the conditions that you observed on the Illinois river today and since the opening of the drainage canal?

A. Well, I consider that there is quite an improvement.

Q. In what way?

A. In the appearance of the water; it looks clearer and purer, and we have got a decidedly better current and it tastes better; it is not so sickly and such a flat, filthy taste.

4990 Q. Have you drank the water of the Illinois river since the opening of the canal?

A. Yes, sir.

Q. How frequently?

A. Not very often; occasionally when I have been on the river, I take a little drink. Early in the year the water is splendid, just splendid, but during this season of the year the water is too warm; take the ice along it makes it very nice.

Q. When you go on your fishing expeditions do you take ice with you?

A. Yes, sir.

Q. What water do you use with the ice?

A. Illinois river water.

Q. Have you ever experienced any deleterious effects from the use of the water?

A. No, sir; I don't think I ever did.

Q. Taking the conditions of the water, as they exist today and comparing those conditions with the conditions that obtained prior to the opening of the drainage canal, what is your opinion as to the effect of the opening of the drainage canal, upon the waters of the Illinois river?

A. Well, there is no comparison generally, prior to the opening of the canal and now; it is a hundred per cent.
4991 improvement, I think.

Q. State in detail how you arrive at that conclusion, and upon what you base your opinion?

A. On the condition of the water and the appearance of it, and the life and the current we have and the tasting of it. Of course, I don't want it understood that I am any expert on this, but then it was in a fearful condition prior to the opening of it, especially in hot weather and at low stage.

Q. Do you observe any odor in the water at present as compared with the odor that existed prior to the opening?

A. Well, no, nothing so bad as it was. Of course vegetable decay in hot weather, you can notice that on any stream, that odor; that kind of a bad smell, and the fish and turtles and many things that die and float around, of course in very warm weather would smell.

Q. Do you know how wide the river is here at Hardin from bank to bank?

A. No, I don't think that I could tell you, but I think it is 400 to 450 yards.

Q. Are you acquainted with nearly all the people that live in Hardin?

A. Yes, sir.

Q. Do you know of anyone having died of typhoid fever in Hardin during the last two or three years?

4992 A. No, No, sir; I don't know that I do; of course while there have been persons died in Hardin, I can't tell you their disease. Now the physicians, of course you understand, would know more about their disease than I did. I haven't heard of any case of typhoid fever, I don't think.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. When you say that the water is better now than it was prior to the opening of the canal, you just judge from its appearance, do you not?

A. Yes, from its appearance and the current and the stage.

Q. You don't know whether there is any deleterious substance in the water now or not?

A. No, sir; I am not scientific enough to explain that.

Q. Well, what has become of the scum and green matter and substances that produced the smell, before the opening of the canal?

A. Well, it has disappeared to a great degree.

Q. Do you know what caused the disappearance?

A. Why, I attribute that to the current and to the stage

of water and the flow which we have now, compared to the river here prior to the opening. It was perfectly stagnant in low water, and just had a green cast all over it, just looked like a pond. There were places and bends in this river that
4993 looked more like a pond than they would a live river; a flowing stream.

Q. You are a man of family?

A. Yes, sir.

Q. Do you use the Illinois river for domestic and drinking purposes?

A. No, sir.

Q. You say you live in the country or right here in Hardin?

A. I live right here in town, Hardin.

Q. From your testimony, then I gather that your idea of pure water is water that looks clear?

A. Well, yes, while I understand that the Missouri river that is never clear is the purest water of the three rivers. I understand that to be true; not knowing, but I have been told that that is the truth. Of course we have fine wells in Hardin and cisterns; we don't use any river water at all, without it flows into our wells here.

Q. What do you mean by flowing into your wells, seeping in?

A. Well, it might seep in, you know.

RE-DIRECT EXAMINATION, by Mr. Todd.

Q. Do you consider water is pure that when you take it, it won't make you sick?

Objected to as immaterial and leading.

4994 A. It will take a long while to answer that question. It would depend on the condition of a man's stomach and how warm it is, and what condition he is in. I have drank the river water when I was very dry, and very warm and it would make me sick at my stomach. I have drank river water again when it didn't affect me a particle, so that it depends on a man's condition I think, more than anything else. I drink very sparingly of river water anywhere out of the river in July or August, without ice. As I stated before, this river water is just as good water as I want, in the winter time and also early spring. It has a good taste and cold and all right of course then. I don't want to make an impression that I consider the Illinois river water absolutely pure, or any other river water so far as that is concerned; I am just comparing it all; the conditions now and prior.

Q. You never had typhoid fever from drinking the water?

A. Never did, no, sir.

M. J. PARKER.

4995 Hardin, Illinois, July 15, 1903.

G. B. CHILDS, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. G. B. Childs; Hardin, Illinois; well, I don't know whether I am called a farmer or what.

Q. How long have you lived in Hardin?

A. I was born here.

Q. Have you lived here all your life?

A. With the exception of my school days and about five years in St. Louis.

Q. Have you become in a general way familiar with the waters of the Illinois river and their condition prior to 1900 when the drainage canal was opened?

A. Yes, sir.

Q. In what manner?

A. Well, by living on it, rowing on it, hunting on it. Living near it, right on the river bank here.

Q. What was the condition of the Illinois river and its water prior to the opening of the drainage canal in 1900 as to quantity, quality, color and taste?

4996 A. Well, I have seen it in the summer during extreme low water when the weeds were growing thickly in it on either side of the channel; it was a greenish cast and full of greenish sediment.

Q. As to its quantity?

A. Well, I have seen it so low that we have had no boats at all on it.

Q. Did it have an odor?

A. Yes, sir.

Q. What kind of an odor?

A. Well, when this moss or grass was on it, it was very offensive; I can hardly describe the odor to you.

Q. To what did you attribute the odor?

A. Nothing but this grass or moss that was in it; I didn't find it otherwise.

Q. Did the people drink it at that time?

A. Well, none about here that I know of.

Q. Do you know whether the fishermen drank it?

A. I can't say as to that, no, sir.

Q. Now, since the opening of the drainage canal, what has been the condition of the river?

A. Well, as far as my observation has gone, it is clearer and the water seems to be better and more volume.

Q. What has been its condition as to grass and sediment?

4997 A. I have seen none since the canal was turned in.

Q. Were you familiar with the ice that was taken out here prior to the opening of the drainage canal?

A. Well, only as I saw them put it up. I put up some before the canal was built, for my own use here at home.

Q. Have you seen ice taken from the river since the opening of the drainage canal?

A. Yes, sir.

Q. Which was the better appearing ice?

A. Well, I don't know as to that; I don't know as I paid any attention to that.

Q. How much in your opinion has the water of the drainage canal raised the Illinois river?

A. Well, I should say here, judging from a bar which you can see the reef of from the boat there, probably five feet.

Q. How wide is the river at this point now?

A. I measured it some years ago; it was 440 yards then.

Q. Do the people drink the water here since the opening of the drainage canal?

A. Well some of them I think do, yes, sir.

Q. What would you say has been the health of the community here since the opening of the drainage canal?

A. Well, I couldn't say that it has been impaired any; or

rather I would think it was benefited; we don't have the
4998 grass and the low water, and we don't have as much malaria.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say you have lived here all your life?

A. Yes, sir; with the exception of my school days and nearly five years in St. Louis.

Q. You are a married man, are you?

A. Yes, sir.

Q. You use cistern or well water at your home?

A. Cistern water.

Q. How long have you been using cistern water?

A. I don't know.

Q. How long have you lived continuously here at Hardin?

A. Up to two years ago, from 1872 up to that time.

Q. In your statement that the water is better now than it was prior to the opening of the canal you judge only from its appearance?

A. Altogether, yes, sir; well, I have drank it being out fishing and taking ice with us.

Q. What is the difference in the flow of the river now and prior to the opening of the Chicago drainage canal?

A. You mean the current?

Q. Yes.

A. Well, we have a more rapid current than we did.

4999 Q. Has there been any time since the opening of the canal in which there was no current?

A. Yes, sir, last spring.

Q. Then the river was lower last spring than it is now?

A. It was higher.

Q. Now, then, when you say it was higher, you simply mean it was higher on account of the backwater of the Mississippi?

A. Yes, sir.

Q. When it was high?

A. Yes, sir.

Q. But aside from the time when the backwater from the Mississippi came up there has been no time that there was not a current since the opening of the canal?

A. Oh, no, sir.

Q. You have never had the water examined chemically or bacteriologically?

A. No, sir.

Q. You don't know what its ingredients are?

A. No, sir.

Q. You don't know whether it contains Chicago sewage or not?

A. No, sir.

GEO. B. CHILD.

5000 Hardin, Illinois, July 15, 1903.

DR. S. FLATT, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. You may state your name, residence and occupation?

A. S. Fatt; residence, Hardin, Illinois; occupation, physician.

Q. How long have you been a practicing physician?

A. Five years.

Q. At what place?

A. Hardin, Illinois.

Q. Have you lived upon the Illinois river prior to coming to Hardin?

A. No, sir; I had not.

Q. Were you familiar with the appearance and condition of the Illinois river prior to January, 1900, when the drainage canal was opened?

A. I was.

Q. Have you fished and hunted upon it?

A. I have.

Q. Describe its condition and appearance as to the color of the water, its quantity, its current and the odor?

A. It was muddier in color, less in quantity; current slower; odor more disagreeable.

5001 Q. To what did you attribute its odor?

A. Well, the odor was due to what is generally termed stagnant water.

Q. Was there much vegetation in the river before the opening of the drainage canal in the bed of the river?

A. I think there was, yes, sir. To my knowledge there was some; there was more prior to the time I came here, so I have been told.

Q. Do you know as to the condition of fish in the Illinois river prior to and since the opening of the canal?

A. In regard to number?

Q. Yes, and their health and strength and activity?

A. Well, there are quite a number more than there have been and the fish all seem to be in good condition.

Q. Did you have occasion to observe the quality and condition of ice taken for domestic use prior to and since the opening of the canal?

A. I think not.

Q. Do you know whether the fishermen on the Illinois river drink the water of the river?

A. Yes, sir, I do.

Q. Prior to the opening of the canal so far as you had an opportunity to know, what was the fact as to the existence of typhoid fever in this community?

5002 A. Well, there has been but little typhoid fever since I came here; I had three cases I think prior to and two since; though one of them was not on this river; one was across towards the Mississippi river.

Q. What in your opinion has been the health of the community since the opening of the drainage canal into the Illinois river?

A. It has been good—exceptionally good.

MR. JEFFRIES: I move to strike out the question and answer for the reason that there is no evidence showing that the people use the water of the Illinois river for drinking and domestic purposes.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You never examined the water in the Illinois river?

A. No, sir.

Q. When you say that the water is better now than it was prior to the opening of the canal you simply judge from its appearance?

A. Yes, sir: I simply judge from the way it appears, from its color; it was not so thick and greenish looking; it is clear and a better smell to it.

Q. The people here in Hardin use wells and cisterns, don't they?

5003 A. Generally, though the last two years; that is two years ago, they used water from the river on account of the drought.

Q. The wells had gone dry?

A. Yes, sir. The people throughout the country generally used river water two years ago.

Q. That was in the dry season of 1901?

A. Yes, sir.

Q. Which continued for several months?

A. Yes, sir.

Q. The wells had all gone dry and it was the only place you could get water?

A. Yes, sir.

Q. What's the difference between the flow of the water now and what it was prior to the opening of the canal?

A. You mean in regard to the current?

Q. Yes?

A. Well, the current is better; the current is three times what it was at that time.

Q. You say you have been practicing medicine five years?

A. Yes, sir.

Q. How old are you?

A. Thirty-one.

DR. S. FLATT.

5004 Hardin, Illinois, July 15, 1903.

GEORGE L. ADERTON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. You may state your name, residence and occupation?

A. George L. Aderton; occupation—I am county clerk of this county, Calhoun County, Illinois.

Q. And reside in Hardin?

A. Yes sir.

Q. How long have you lived in Hardin, or on the Illinois river?

A. I have lived in Hardin since December 1st, 1894.

Q. Have you been continuously county clerk since that time?

A. No sir, I was sheriff and collector of this town from 1894 until December 1st, 1898.

Q. Have you fished and hunted much or any upon the Illinois river?

A. Well I have never hunted any; I have fished a great deal with rod and line.

Q. Were you prior to the opening of the drainage canal, familiar in a general way with the waters of the Illinois river?

A. Well I never have been scientifically familiar with it.

5005 Q. Were you familiar in a general way with its quantity, color, odor and current? If so, state what its condition was in these respects prior to the opening of the drainage canal?

A. Yes sir; I noticed prior to the opening of the drainage canal the water was sluggish and not so clear as it is at the present time, or after the opening of the drainage canal. There seems to be more current and the water has generally a better and clearer appearance since the opening of the canal.

Q. Prior to the opening of the canal did it have a perceptible odor at times?

A. Why, I never noticed that it had, never to my knowledge have I noticed any odor.

Q. Are you acquainted generally with the people upon the Illinois river living in Calhoun County?

A. Yes sir, I have a pretty tolerably extended acquaintance around here throughout the county, bordering on the Illinois river.

Q. Including the fishermen, are there many people who use the waters of the river since the opening of the drainage canal for domestic purposes?

A. Well, I couldn't say as to that. We haven't used it—you say since the opening of the canal?

Q. Yes.

A. We have used it both before and since, but not for
5006 cooking or anything like; we have had it for laundering and such as that.

Q. Do the people when upon the river engaged in fishing, drink the water?

Objected to as leading and suggestive.

A. Well, I don't know as to that of my own knowledge; I have drank it myself, while out fishing. And I have known others with me, but to make a general statement of it, I couldn't say as to that.

Q. Since the opening of the drainage canal, what has been the general condition of the health of the people along the river as compared with the period before the opening of the canal?

A. Well in our own immediate vicinity here—

MR. JEFFRIES: That is objected to because there is no evidence showing that the people generally use the water for drinking and domestic purposes.

A. I think the general health of the people is about as good now as it was prior to the opening of the canal. I can only speak for our own immediate vicinity here.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Your people use cisterns and wells don't they for their domestic and drinking water?

A. We do, yes sir.

5007 Q. Well, the people generally in the town?

A. I presume they do, yes sir.

Q. Well, don't you know that they do, your neighbors?

A. No sir, I couldn't say that they do; sometimes their cisterns go dry and they have got a good many public wells in town.

Q. Have what?

A. I say I think perhaps that they use more well water than river water, because our town is well supplied with wells, and as to saying positively whether they do or not, I couldn't do it.

Q. Well do you know that they use river water?

A. No sir.

Q. Now what is your opinion about it, as to which they use?

A. Well, I haven't any opinion about it.

Q. Well, what is your information?

A. I am not sufficiently familiar with my neighbors to know what they do; I am not supposed to know that; I only know how it is in my own family.

Q. Are you sufficiently familiar with your neighbors to know when they are sick?

A. Well yes.

Q. To judge of their health?

5008 A. You generally in a town of this size know about who are sick in it. Sickness though of anybody that is seriously ill.

Q. How does the current of the water in the Illinois river now compare with what it was prior to the opening of the canal?

A. Why, prior to the opening of the canal we had no current scarcely.

Q. What have you got now?

A. We have got a good current now.

Q. At all seasons of the year?

A. Yes sir.

Q. Except when the water of the Mississippi backs up!

A. Yes sir, the current runs the wrong way during the high water.

Q. The water from the Illinois river then is not used very extensively for domestic and drinking purposes by the people in this locality?

A. Well sir, I couldn't say outside of the immediate vicinity of Hardin. I don't think that the river water is used for cooking to any great extent.

Q. Or drinking?

A. Well except by the fishermen that are out in the river. Still, there is a good many people that use it occasionally. I am one of them myself.

Q. They do not make a practice of it though?

A. No.

5009 Q. You never had the water in the river examined?

A. No sir.

Q. Either chemically or bacteriologically?

A. No sir.

Q. Either before or after the opening of the canal?

A. No sir.

GEO. L. ADERTON.

5010 Hardin, Illinois, July 15, 1903.

T. J. SELBY,

called as a witness in behalf o fthe defendants being first duly sworn, by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. My name is T. J. Selby; residence Hardin, Illinois; occupation, lawyer.

Q. How long have you lived in Hardin?

A. Since September 16th, 1884.

Q. Were you at one time a member of Congress of the United States?

A. A member of the 57th Congress.

Q. Have you been engaged in the practice of law in Hardin and other counties upon the Illinois river?

A. Yes sir. I commenced practicing here in 1875; I lived then at Jerseyville.

Q. Describe the location of Calhoun County.

A. Calhoun County north and south is about 50 miles in length and at its widest point about 12 or 15 miles in width and lies between the rivers Mississippi and Illinois, at the junction of those rivers.

5011 Q. On which river is Hardin—the county seat?

A. The Illinois river.

Q. How far is it from Hardin to Grafton by river?

A. I would say about 30 miles; I am just guessing at that.

Q. What is the general direction of' Calhoun County—north and south?

A. Yes, a little to the east of north and south, at the lower point.

Q. Were you familiar with the general appearance and condition of the Illinois river along Calhoun county prior to the opening of the drainage canal in January, 1900?

A. Yes sir, somewhat.

Q. What was the condition of its waters as to current, color and the odor?

A. Well at what time of year?

Q. Well at any time; its general condition?

A. Of course in high water time we would have a good current. In the summer season when the water was lowest, there was very little current in the river at this point anyway; it resembled very much a large pond; I have seen it filled with grass, particularly on the eastern side of the river at this point. The color of the water, I am not positive about that. It was not absolutely clear nor yet really muddy so far as my recollection goes.

5012 And as to the odor, sometimes that would be pretty bad in the fall season, perhaps in September, owing to this decaying vegetation being in the river. That was not always the case, however; when the river was high why the conditions would be different. The water then would be muddy and the current stronger and it would sweep away this accumulation of stuff in the river. Our low water period it seems to me is from —I would say from the first of July on into the fall.

Q. What has been its condition since the opening of the drainage canal in the respects mentioned?

A. In respect to grass and vegetable growth which was formerly here is now totally absent, and has been since. 1901 was a very dry year and we had very fair water; such a year as 1901, previous to the opening of the canal, it closed this river up to navigation to the mouth, from this part further up as far as Kampsville dam. Yes, we have had very low water in this river many times; very near wade across it sometimes.

Q. What difference is there in the color of the water since the opening of the drainage canal, or its turbidity?

A. You mean whether it is clearer now than it was before?

Q. Yes.

A. It may be clearer, but I wouldn't be positive about that:

I have not specially inspected the water with a view to ascertaining that. From the general appearance of the river
5013 itself it looks probably clearer, but I have not inspected it for the purpose of ascertaining.

Q. What in your opinion has been the general health of the community since the opening of the drainage canal as compared with the conditions before?

MR. JEFFRIES: We object to the question for the reason that it assumes necessarily that the people in this locality use the water of the Illinois river for drinking and domestic purposes and no such assumption has been shown in evidence.

A. It has been good; I don't know of any time when it has been particularly bad, however.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You say you are not very well acquainted with the appearance of the water either before or after the opening of the canal as I understood it?

A. To answer that question specifically, I don't believe I could because I didn't make an examination. I can only state from general appearances. I have been on the river frequently, crossed it and fished in it and noticed it; drank out of it, before and since the canal—since the opening of the canal. My idea is if there is any difference I would say that it is clearer now than it was at low water times before.

Q. That is simply an ocular observation only?

5014 A. Yes sir, all I know about it is from observation; my opinion is all based on it.

Q. You have had no examination made of the water either before the opening of the canal, or since?

A. No sir, you mean chemically?

Q. Bacteriologically or otherwise?

A. No; I look at it before I drink it. I am no bacteriologist; I don't know of any ill effects from the use of the water or haven't heard of any.

Q. You can't say whether or not it does now or did prior to the opening of the canal contain deleterious substances so far as you personally know?

A. No, if it does, there don't any of us know.

Q. Mr. Selby, your people here in Hardin use cistern or well water for cooking and drinking purposes don't they?

A. They use both well and cistern water.

Q. Of course you don't know how these people living in shanty boats, whether they get it from wells or the river or what?

A. They use it out of the river.

Q. That is your judgment?

A. I have seen them dip it up in buckets. In fact once or twice I have been out hunting and have been caught at their places and got a cup and got a drink myself, out of the river. It has been more than once or twice.

5015 Q. What is the difference in the flow of the water now and prior to the opening of the canal at all seasons of the year? Omitting the back water from the Mississippi river?

A. We have a better stage of water. We have a better current; a stronger current.

Q. How much stronger?

A. Well, a great deal. I don't know what the per cent would be, but I would say considerable. It is sufficient to carry away—we are not bothered any more with this grass and moss and substances like that: We have got a pretty fair current.

T. J. SELBY.

5016 Hardin, Illinois, July 15, 1903.

ELMER E. WILLIAMS,

called as a witness in behalf of the defendants, being first duly sworn, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Elmer E. Williams.

Q. What is your business?

A. Cashier of the Bank of Calhoun County.

Q. How long have you lived in Hardin?

A. Since February, 1899.

Q. Since 1899 have you been familiar with the Illinois River?

A. Yes sir.

Q. What was the condition of the Illinois river from February, 1899, to January, 1900?

A. Well, do you mean take it in the season—in February it was frozen over, as to the summer months?

Q. The summer months?

A. Well in the summer months, we had a swimming club here and at that time we would go swimming down at Rocky bar about a mile below. The water got so foul along in July and August, about August I guess, that we couldn't go in swimming any more.

Q. Just describe the water?

5017 A. Well there would be a green scum on the water and a very foul odor from the water; very turbid. And it was very low too.

Q. Did it have any odor?

A. Yes, a very decided odor.

Q. Did you ever observe the odor?

A. Why yes, we could observe it from where we lived; we live about two blocks from the river and the street runs right down to the river with no buildings south of it; it was very offensive.

Q. What has been the condition of the river since the opening of the drainage canal?

A. Well the next summer, which was in 1900, the lake water had been turned in at that time, and of course that being my first year here I noticed it possibly more than others, that the lake water made a difference in the appearance of the water; there was no green scum formed and there was no perceptible odor like there was the previous year, and that condition has been, I think improving for the better as to the sanitary conditions and clearness of the water and less foul.

Q. What is your opinion as to the effect of the sanitary canal waters upon the waters of the Illinois river at this point?

A. Why I think they have purified it; the drainage canal has purified the water.

5018
CROSS-EXAMINATION,
By Mr. Jeffries.

Q. You are not an expert on the sanitary condition of water?

A. No sir; it is just my general observation, that's all.

Q. You never had this water examined either before or after the opening of the canal?

A. Never did.

Q. How long have you been in the banking business.

A. About twenty-three to twenty-five years.

Q. How long here?

A. Since 1899.

Q. Yours is the only bank in Calhoun County, is it?

A. Yes sir.

Q. Was there a bank here prior to your coming?

A. No, this was the first bank in the county.

Q. Any railroads or telegraph lines through the county?

A. No, there are no railroads and no telegraph lines in the county.

Q. You don't remember the condition of the Illinois river at this point for a longer period than the first year before the opening of the canal?

A. No, not previous to February of 1899; that was when I came here.

Q. You don't use the water of the Illinois river for drinking and domestic purposes do you?

5019 A. No sir.

Q. You use cistern or well water?

A. Cistern water, yes sir. I have drank the Illinois River water though when I was out fishing.

Q. Your neighbors have cisterns or wells?

A. Well yes, but then for drinking purposes they most all use water from the town pumps here. We use cistern water, because in the winter I turn the ice water or snow water into the bank cistern and we use that for drinking purposes at the house, not having any well.

Q. Now you spoke of the water being in better condition since the opening of the canal than prior to its opening? You don't know whether or not the deleterious matter contained in the Chicago sewage comes down this far do you?

A. No, I couldn't state that.

Q. You don't know anything about that?

A. No.

Q. It may or may not so far as you know?

A. No, I do not know.

ELMER E. WILLIAMS.

5020 Hardin, Ill., July 15, 1903.

WILLIAM McNABB,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. William McNabb.

Q. What is your business?

A. Druggist.

Q. How long have you been living in Hardin?

A. About six years.

Q. Were you acquainted with the Illinois river before and since the opening of the drainage canal?

A. Yes sir; been acquainted with the river ever since I come here, about six years.

Q. How did you become acquainted with it?

A. Well by being on the river a good deal.

Q. In what way?

A. In living near, I have been on the river quite a good deal and then lived here since that time.

Q. What were you doing on the river?

A. Why I have been on the river boating and I have been fishing.

5021 Q. Will you describe the character of the waters of the Illinois river prior to the opening of the drainage canal in 1900?

A. The water in 1900 was very low, the stage of the water here, scarcely any current and the condition of the water was not as good as it is now by any means; there was a scum over the river during that year, a green scum.

Q. Do you mean 1900 or 1899? 1900 is the year that the drainage canal was opened on the 17th of January?

A. Well now, I guess that is right; it was before the canal was opened, the season before we had very low water here and in that year there was a green scum over the water.

Q. Was there any odor to the water?

A. Yes, there was.

Q. Since the opening of the drainage canal, have you observed any changes in the Illinois river and if so, what are they?

A. Well we have had a better stage of water, a good current. and we have no scum over the water, and the odor is not—there is scarcely any perceptible odor now.

Q. Is the water any better or worse than it was before the opening of the drainage canal?

A. It is a good deal better.

Q. What leads you to that conclusion?

A. My observation would be about all.

5022 Q. How many druggists in this town?

A. Just one.

Q. Are you the only one?

A. Yes sir.

Q. Do you know whether there has been any typhoid fever in this town since the opening of this canal?

A. I disremember of a case now, since; there perhaps has been but I haven't in mind a case now since the opening of the canal.

Q. Has there been as much malaria in this community since as existed before the opening of the drainage canal?

A. No sir, there has not.

Q. How do you know that?

A. Well, I know from the chill tonics and preparations for that complaint; we haven't sold since the opening of the canal—we haven't sold one-third or perhaps one-fifth as many as we did before.

MR. JEFFRIES: Move that the question and answer be stricken out because it is incompetent, irrelevant and immaterial and does not prove any issue in the case.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You are a married man?

A. No sir.

5023 Q. Do you board or live at home with your parents?

A. I board.

Q. You don't use water from the Illinois river?

A. No sir.

Q. I understood you to say that your opinion as to the water being better now than it was before the opening of the canal was based altogether on your observation of the river?

A. Yes sir.

Q. You never made or had made any examination of the water for sanitary purposes?

A. No sir, I have never made any for sanitary purposes.

Q. You don't know whether the deleterious matter contained in the sewage that comes from Chicago is contained in the water here at Hardin or not do you?

A. No sir—

Q. From personal knowledge?

A. No sir, not from a bacteriological standpoint; I don't know anything about that, I never had anything to do with it; I never examined the water in that way. Only of course from seeing it that I know, and the changes.

Q. In fact you don't know anything about the ingredients of the water?

A. I do not.

5024 Q. It may contain deleterious matter and it may not so far as you know?

A. Yes sir, it may.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Do you know that as a matter of fact chemistry and bacteriology do not prove whether water has deleterious substances in it or not?

MR. JEFFRIES: We object to the question for the reason that the witness has not qualified as a chemist, and disqualified himself as a bacteriologist and has not qualified himself as ever having any practical or laboratory experience as a chemist or bacteriologist, or as an epidemiologist, or a person possessed of sufficient knowledge to offer an opinion upon the result of the experiments and work of men of chemical and bacteriological science, or in the analyses of water from a sanitary standpoint.

Q. (Question repeated.) And that epidemiologists hold that it is not necessary to know the chemical and bacteriological constituents of water in order to pass upon the sanitary character of it.

A. Well, I don't think it proves anything; I think there is a great deal of guess work done about it in fact I know 5025 there is.

RE-CROSS-EXAMINATION, by Mr. Jeffries.

Q. You are not a bacteriologist?

A. No, sir; I have studied bacteriology though.

Q. You are not an epidemiologist?

A. No, sir.

Q. You don't know what it takes to be an epidemiologist?

A. No sir; I don't know the requirements.

Q. You never were connected with any of the water systems of any of the larger cities in the United States?

A. No, sir.

Q. Never made any examination of their water supply?

A. No, sir.

Q. You don't know what the requirements for the best water supplies in the cities of the United States are?

A. No, sir.

Q. You don't know what percentage of the various ingredients deleterious or otherwise would condemn water for supplying a large city with water for domestic and drinking purposes, do you?

MR. TODD: I object to that question because there is no tribunal except a self-constituted individual tribunal authorized to condemn any water used for domestic and drinking pur- 5026 poses?

A. Well, I can't say that I don't know, but I think that that would vary according to the minds of the different chemists, but they may have a standard. If they have any standard of the deleterious ingredients that water should contain; I don't know what it is.

Q. Well, you don't know whether they have any standard or not?

A. No, sir; I don't know that they could have, because I think the opinions of that vary.

Q. You don't know then whether they have or not?

A. No, sir.

Q. In other words, you don't know a thing about it?

A. I don't claim that I know anything about it; I said that in the first place.

WM. McNABB.

5027 Hardin, Illinois, July 15, 1903.

L. M. DAVIS, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. State your name, residence and occupation?

A. L. M. Davis; Hardin, Illinois; my occupation is a general merchant.

Q. How long have you lived in Hardin?

A. Why, since December of 1880. That would be over 23 years.

Q. How long have you lived on or near the Illinois river?

A. Why, ever since 1855, except about five years I was in the army of the United States.

Q. Were you a soldier in the war of the rebellion?

A. Yes, sir.

Q. What was the condition of the Illinois river prior to January, 1900, when the drainage canal was opened?

A. Why, in what respect?

Q. As to quantity of water, current, color of the water, odor and use for domestic purposes?

A. Well, it was less current and to my judgment a great deal more odor and so far as the use of the water for domestic purposes—I know but little about that; I don't know who uses it.

5028 Q. To what did you attribute the odor prior to the opening of the drainage canal?

A. Well, stagnation; the lack of current would be my idea about it.

Q. As to the color of the water, how does it compare with the color since the opening of the drainage canal?

A. Well, I can't say that I see a great deal of difference in the color of the water except in places there would come a kind of a green scum on it; I have seen that along in places where there was no current, and I haven't seen that since the canal has been turned in; haven't noticed it here.

Q. Is there any odor in the water since the opening of the drainage canal?

A. I have never noticed any.

Q. What has been the general health of the community here since the opening of the drainage canal, as compared with the conditions before?

A. Well, I don't hardly know about that, but I am pretty well satisfied that the health has been equally as good as it was prior to the canal coming in.

Q. Did you know the river prior to the opening of the drainage canal, when it was very low?

A. Yes, sir; I have seen it very low.

Q. If you remember of any example of its condition, you
5029 may tell what it was.

A. Well, 12 or 13 years ago the water got so low at this point that boats were unable to get here,—that is steamboats—and I remember of a season prior to that when they got men at a point about I should say 20 or 25 miles north of here to go in with plows and scrapers to make a channel for a boat to go through; that was at Schoolhouse Bar, two miles below the C. & A. bridge.

Q. Do you remember the season of 1901, here as to whether it was a season of rains or of excessive drought?

A. I am not sure about the date; I know we had an excessive drought there a few years ago; I don't remember when it was; we had no rain I think from June to November.

Q. If in that time the waters of the drainage canal had not flowed through the Illinois river, would it have been navigable?

A. I think not, sir, with anything larger than a skiff.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. In your statement that the water is better since the opening of the canal than it was prior to the canal you are simply speaking from observation?

A. Yes, sir; I have never used the water.

5030 Q. You use well or cistern water?

A. Yes, sir; use both.

Q. You don't know then whether it contains deleterious matters or not?

A. Why, no, not from experience.

Q. What is the flow of the river with reference to its current now as compared to what it was prior to the opening of the canal?

A. Why, it is a stronger current, swifter current.

Q. You say they haven't cut any ice here for several years past?

A. No, sir; only along the shores you know.

Q. What they call floating ice?

A. Yes, sir; I guess it would be called that.

Q. The people around here in this locality use well or cistern water, don't they generally?

A. Well, yes, sir, to a great extent.

Q. Almost exclusively outside of the fishermen?

A. Yes, sir; I think so. We have several public wells most always.

Q. A great many of the fishemen have their own wells too, don't they, where they live in their houses?

A. Well, no, I don't know of any. They go to the public 5031 wells; we have five or six there in town.

L. M. DAVIS.

5032 Hardin, Illinois, July 15, 1903.

WILLIAM U. MORTLAND, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. State your name, residence and occupation?

A. William U. Mortland; postmaster; Hardin, Illinois.

Q. How long have you lived in Hardin?

A. Approximately 37 years; I was born and raised here.

Q. Have you during that time become familiar with the waters of the Illinois river, and if so, in what way?

A. I have always lived near the river, within 500 yards more or less, and while I have never made a chemical analysis of the water and practically know nothing about chemistry, all I know is from general observation.

Q. Have you fished and hunted in the waters of the Illinois river?

A. I have fished more or less with a hook and line and have been in bathing frequently.

Q. What was the condition of the water of the Illinois river prior to January, 1900, when the drainage canal was opened?

A. Well, it varied with the years, to the best of my memory
it was something in the nature of a stagnant pool; the
5033 water was covered in summer with a yellow scum, ap-
parently little current, and very strong odor. Of course it varied in different months in the summer; when the weather got warmer it was stronger; the month of August was especially bad.

Q. Was there a great deal of vegetation in the river prior to the opening of the drainage canal?

A. Yes, sir; what we commonly called buffalo grass; I remember some years ago of shooting fish in about the middle of the river in the buffalo grass; the grass was everywhere here.

Q. To what did you attribute the odor in the river prior to the opening of the canal?

A. Well, I don't know as I can say; there was comparatively little current and this buffalo grass doubtless tended to create that smell, and this scum that appeared on the water I presume had something to do with it.

Q. Was that probably from decay of the vegetation?

A. I should judge so.

Q. What has been the condition of the river since the opening of the drainage canal?

A. From general appearances the current is stronger and the water is clearer, and comparatively little if any odor from the water, and a better stage of water generally, and the absence of this buffalo grass; I haven't noticed it at all since that time.

5034 Q. What has been the general health of the community?

A. I know that a few years ago there was more malaria than there is today and than there has been in the last few years, whether that may be attributed to the difference in the condition of the water or not I can't say.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. What do you mean when you say that the water is better now than it was before the opening of the canal?

A. Well, judging from general appearance; the water is clearer now than it was, and judging from the speed of the current.

Q. You don't know whether it contains deleterious matters or not, do you?

A. No, sir; I do not.

Q. You don't use the water, do you?

A. No, sir.

Q. What is the comparison between the water now and what it was prior to the opening of the canal so far as the flow or current of the water is concerned?

A. The current is much swifter now than it was before. I only judge that from the boating that I have done, and the swimming occasionally.

5035 Q. The water flows now with a regular current at all seasons of the year except when the back water from the Mississippi interferes?

A. I presume so, yes, sir.

Q. Was that true prior to the opening of the canal?

A. Yes, sir.

Q. It had a current at all seasons of the year, did it?

A. Yes, sir.

Q. Much of a current?

A. Very little current before; considerable of a current since.

Q. You don't know whether the deleterious matter from the sewage from Chicago reaches this point or not?

A. I do not.

WM. U. MORTLAND.

5036 Hardin, Illinois, July 15, 1903.

JEFFERSON WELCH, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. Jefferson Welch; Hardin, Illinois; fisherman.

Q. How long have you been in the business of a fisherman?

A. Twenty-one years.

Q. How much of that time have you fished in the waters of the Illinois river?

A. Mighty nigh all the time. Of course I get over in the Mississippi sometimes in June or July, but then I fish kind of steady here.

Q. Have you been fishing with nets?

A. All the time with nets.

Q. How many miles above and how many below Hardin have you fished during these years?

A. Well, about 18 miles north, that is up as far as Pearl; that is 18 miles and about that far down the river.

Q. Prior to the opening of the drainage canal, what was the condition of the waters of the Illinois river?

5037 A. Well, it was low in the summer, full of moss and no current.

Q. What effect did the condition of the water have upon the nets?

A. Why it was full of moss, covered with moss; green moss. I would have to take it off with my hands; sometimes let it dry and knock it off.

Q. What was the condition of the fish in the Illinois river prior to the opening of the drainage canal?

A. Well, I don't know; I don't think they were as good as they are now; you see more dead fish along the banks; I haven't in the last few years seen very many dead fish along the banks, like I used to see; that is several years ago.

Q. Since the opening of the drainage canal, what has been the condition of the waters of the Illinois river?

A. It has been more pure, more current, and there was not near as much sickness; wasn't near as much fever and ague along the banks or low-lands as there was before.

Q. What is the condition of the fish in the Illinois river since the opening of the drainage canal?

Objected to as having been answered and as immaterial.

A. I would judge they were better.

Q. Do they live longer now in live-boxes than before the opening of the canal?

Objected to as immaterial.

5038 A. Well, they do if you keep your live-boxes in the current.

Q. As a fisherman do you drink the waters of the Illinois river?

A. Yes, sir.

Q. How is its drinking quality now as compared with before the opening of the canal?

A. Why, it is better now than it was, more cooler, the water drinks better.

Q. Do the fishermen along the Illinois river generally drink its waters while they are fishing?

A. Yes, sir; most generally do.

Q. Do you know of any typhoid fever among the people drinking the Illinois river water since the opening of the drainage canal?

A. No, sir.

Q. Have you been engaged somewhat in assisting in putting up ice?

A. Yes, sir.

Q. State the condition and appearance of the ice both before and after the opening of the drainage canal?

A. Well, I don't know the difference; it seems like to me the ice is more clear than it was before, more solider and more bluer than it was before.

5039 CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say you are a fisherman?

A. Yes, sir.

Q. Don't you know that there has been very little ice put here in the last few years?

A. Oh, we didn't put up none this last year. Of course once in a while we miss here, except if we don't put it up here we put it up on the river somewhere below or above.

Q. What is the difference between the current in the Illinois river now and what it was prior to the opening of the canal?

A. We have more current.

Q. Was there a good current all the time before the opening of the canal?

A. Before the opening of the canal we had a very slack current in the summer time, and of course if we had a head raise, then there was a current.

Q. You have a good current now all the time?

A. Pretty fair current all the time now, yes, sir.

Q. Do you live here in Hardin?

A. Well, I live just a mile and a half north of here.

Q. Do you live in a house or a house-boat?

A. I live in a house.

Q. Have you a well or a cistern?

5040 A. I have both.

Q. And you use well water for domestic purposes?

A. For domestic purposes, yes, sir.

RE-DIRECT EXAMINATION, by Judge Johns.

Q. Is the water from your well the water from the Illinois river which seeps in?

A. No, sir.

JEFFERSON WELCH.

5041 Hardin, Illinois, July 15, 1903.

WILLIAM MORTLAND, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. William Mortland.

Q. What is your business?

A. Farmer and fruit grower.

Q. Where is your place?

A. At Hardin; it is in the corporation here.

Q. Did you ever have any official position in this county?

A. Yes, sir.

Q. What?

A. I was county judge and I was a member of the Legislature in 1881 and 1882.

Q. Have you ever steamboated on the Illinois river?

A. No, sir; I have wood-boated.

Q. How long have you lived in this county?

A. I came here in 1848 and have been here since.

Q. Are you acquainted with the Illinois river?

A. I am around here.

5042 Q. Will you describe the conditions of the Illinois river prior to January, 1900, the opening of the drainage canal and since?

A. I lived on this river and I have seen this grass growing all the way, except about 100 feet of the channel that wasn't covered with grass; I have seen cattle and hogs grazing on it, and I have seen it here when we couldn't get a boat; when we couldn't get our freight loaded and I have seen it with a green scum all over it; it was unhealthy.

Q. What has been the condition of the water of the Illinois river since the opening of the drainage canal in 1900, and what effect in your judgment has the opening of the canal had upon the waters of the Illinois river?

A. Well, it is a good deal healthier here since the canal was opened, and I think the water is much better than it used to be.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Why do you say that the water is better than it used to be?

A. Why, there is not so much sickness here as it used to be and I am satisfied that it is healthier than it used to be.

Q. That is just your opinion, isn't it?

5043 A. Yes, sir; that's just my opinion.

Q. You are not an epidemiologist?

A. No, sir; as I said before, I am a farmer; I am just giving you my opinion.

Q. You have wells and cisterns on your farm?

A. Yes, sir.

Q. You use out of them for domestic and drinking purposes, do you?

A. Yes, sir.

Q. Your neighbors are supplied with wells and cisterns?

A. Yes, sir; some of them.

Q. And those who do not, use the town water?

A. Yes, sir.

Q. The only reason now that you have for believing the water to be better since the opening of the canal than it was prior to the opening of the canal is the fact that there is more current?

A. Yes, sir; there is more current than there used to be and there is no green scum on the water like there used to be and there is not so much malaria as there used to be.

Q. You don't know whether or not the water contains deleterious matter?

A. No, sir.

5044 Q. You don't know anything about the ingredients of the water?

A. No, sir.

WM. MORTLAND.

Adjourned to meet at Kampsville, Illinois, at 9 a. m., July 16, 1903.

5045 9 a. m., Thursday, July 16, 1903.

Parties met pursuant to adjournment.

Present, same as before.

Kampsville, Ill., July 16, 1903.

C. B. BRAKEVILLE, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. C. B. Brakeville; Kampsville, Ill.; I am a fisherman.

Q. How long have you been a fisherman?

A. Well, all my life; I never did anything else much.

Q. At how many places have you fished along the river?

A. Well, I fished at Copperas Creek locks; Havana, Meredosia, Pearl and Kampsville.

Q. Were you familiar with the condition of the Illinois river before the opening of the drainage canal in January, 1900?

A. Yes, sir.

Q. What was its condition with reference to the quantity of water?

A. Well, I don't know. I don't remember.

Q. Was there as much water in the river before the opening of the drainage canal as since?

A. Well, at times, no; not at times.

Q. Did the river sometimes become stagnant?

A. Yes, sir; very bad; it would be all green on top.

5046 Q. Was there an odor in the water?

A. Well, yes, to a certain extent.

Q. What did that come from?

A. Well, I don't know without it was from the water being so dead; that is the only way I can account for it; vegetation.

Q. Was there considerable grass and weeds in the river before the opening of the drainage canal?

A. Well, I don't remember about that; I don't know; I don't remember.

Q. What about the moss and slime upon your nets?

A. Well, yes, there used to be a good deal of slime and moss and such as that.

Q. Since the opening of the drainage canal how has the water been with reference to smell?

A. Well, I have never seen it smell.

Q. How about grass and weeds in the water?

A. Well, I don't know as there is any more than there ever was.

Q. How about the color of the water; is it clearer or less clear than before?

A. Well, to the best of my knowledge, it is clearer than it ever was; it clears up a little quicker.

Q. Do the fishermen as a rule drink the water of the river?

A. Yes, sir; I guess there hasn't been a day in ten years but what I have drank some of the water; every day that I have been on the water.

5047 Q. Are you pretty well acquainted with the fishermen along the river?

A. Well, a good many places, yes, sir.

Q. Do the fishermen have typhoid fever?

Objected to as leading.

A. Well, no, not very bad; you hardly ever see a fisherman sick.

Q. What do you say as to the health since the opening of the drainage canal; is it better or worse than before?

A. Well, I don't know; I never noticed it particular, whether any difference in it or not.

Q. Do you know anything about typhoid fever among the fishermen since the opening of the canal?

A. No, sir; never heard of it.

Q. Is there any difference in the color and quality of the ice, since the opening of the drainage canal, state what it is?

A. Well, there isn't any that I know of, without it is clearer. Clearer ice.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say you live here in Kampsville?

A. Yes, sir.

Q. How old are you?

A. 34 years old.

5048 Q. How long have you been fishing?

A. Well, ever since I can remember anything at all; never did anything else to amount to anything.

Q. Was your father a fisherman?

A. Yes, sir.

Q. Do you live in a boat on the river?

A. I have, yes, sir, all the time; or about all the time.

Q. What is the difference between the current or flow of the river now and what it was prior to the opening of the Chicago Drainage canal?

A. Well, we have a good deal stronger current.

Q. The water in the Illinois river is not clearer at all times and seasons of the year now, since the opening of the canal than it was prior to the opening of the canal?

A. Well, not at all times of the year; when it rains it muddies up but it clears up much quicker than it used to I think.

Q. Whenever a fair sized flood comes, the water gets just as cloudy and muddy now as it did prior to the opening of the canal, does it?

A. Yes, sir; for a short while.

Q. You say there was grass growing in the water prior to the opening of the canal?

A. Well, I don't remember; I don't know; there was grass and moss, that's about all.

5049 Q. What has become of that moss?

A. Well, I don't know; it seems as if it happened every few years; it never was much of a steady thing.

Q. How much of a current is there in the river now?

A. I don't know; I never tested it and I never heard anyone say.

Q. Quite a good current?

A. Pretty fair current, yes, sir.

Q. Now?

A. Yes, sir.

Q. In going down the river this morning, from this point to the dam I noticed the drift flowing down the river, do you know what is the cause of that?

A. Well, it is from the current, that's all I could tell you.

Q. Pretty fast current?

A. Well, yes, sir; there isn't as much right here as after you get away a little piece.

Q. You mean further up the river?

A. Yes, sir.

Q. How far is it from where this boat on which we are taking testimony, down to the dam?

A. Well, it is something like a half a mile.

Q. This current that you speak of continues down on and
5050 over the dam does it not?

A. Yes, sir.

Q. What is the stage of the water in the Illinois river at this point as compared with the ordinary stage of water?

A. Well, it is some lower right now than it has been for several years, that is the last two or three years.

Q. How far up the Ilinois river are you familiar with it?

A. Well, probably up as far as Beardstown.

Q. How far is that?

A. About 60 miles; something like that; I don't know exactly.

Q. There is a good current from Beardstown down the river to this point, is there not?

A. Yes, sir.

Q. How far are you acquainted with the Illinois river from this point down towards its mouth?

A. Well, down as far as Grafton; I have been down there quite often.

Q. Now, there is a good current from here to Grafton, is there not?

A. Well, pretty fair, yes.

Q. Then I take it that if the river is lower now than it has been for several years, two or three years, that there has been a good current in the Illinois river so far as your 5051 acquaintance with that river goes, ever since the opening of the canal?

A. Yes, sir.

Q. Was that true prior to the opening of the canal? Or before it was opened?

A. I didn't understand you.

Q. Was there a continuous current before the opening of the canal?

A. Yes, sir.

Q. How much?

A. I don't know.

Q. Did I understand you to say in your direct examination by Judge Johns, that at times the water became stagnant?

A. Yes, sir; just the same as some little puddle; I have seen it out here when you could see the mark of a skiff for miles through the water.

Q. You say it became just as a puddle?

A. Yes, sir.

Q. Then the water was comparatively still?

A. Yes, sir; the water was still; there wasn't any current above this dam at all.

Q. You don't know whether or not the water in the Illinois river contains certain substances that are injurious to health if used for domestic and drinking purposes, do you?

A. No, I don't know that there is.

5052 Q. Then your only reason for believing that the water is better is because there is some increase in volume and a stronger flow? Is that true?

A. Yes, sir.

Q. You are not a physician?

A. No, sir.

Q. You are out on the river a great deal?

A. Yes, sir; every day and part of the night.

Q. You know comparatively little about the sickness in this town and around the country?

A. Well, I don't know; I never paid much attention to it.

Q. You never paid much attention to it?

A. No, sir.

C. B. BRAKEVILLE.

5053 Kampsville, Illinois, July 16, 1903.

EDWARD HEATON, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Edward Heaton; Kampsville locks; fisherman.

Q. How long have you been a fisherman?

A. Forty-two years.

Q. At what places on the Illinois river have you fished?

A. I commenced fishing at Chillicothe; fished at Peoria, Beardston, Meredosia, Montezuma, Bedford and Kampsville.

Q. Were you acquainted with the Illinois river at these places before the opening of the drainage canal in January, 1900?

A. Yes, sir.

Q. What was its condition?

A. Well, until from the government locks were put in, until we opened the canal, our low water got very stagnant, dead and bad, and since that, why, we never have had stagnated water.

Q. What was the smell of the water before the opening of the drainage canal?

5054 A. Well in the winter time when we were setting nets, the smell that would come out from the ice we couldn't stand at all; a sort of a gas.

Q. Where did you first observe that?

A. Up at Bedford, and Montezuma; the two towns are right close together.

Q. What effect did it have upon the fish?

A. Well, I won't be positive now about it being 1893, 1894 or 1895, but in one of the years it killed all our catfish.

Q. Did the water have an odor or smell in the summer?

A. Yes, sir; here at the dam anybody could notice it all summer long.

Q. Since the opening of the drainage canal has there been any odor in the water?

A. No, sir.

Q. How about moss and slime on your nets before the opening of the drainage canal?

A. We would have it in low water just the same as we have it now-days.

Q. At which time, before or after the opening of the drainage canal, was the condition of the fish best?

A. At which time of year?

Q. No, whether before or after the opening of the canal?

A. Well, you couldn't notice any difference in the fish.

5055 Q. Did they live longer in the live-boxes before or after?

A. In low water, they wouldn't live at all, before; we didn't have current enough to give them fresh water.

Q. Do they live in the live-boxes now?

A. Middlin' fair.

Q. Have you assisted in the winters before and after the opening of the drainage canal, in putting up ice?

A. Yes, sir.

Q. Is the ice clearer now than before the opening of the drainage canal?

A. Well, we get the ice a good deal clearer in some places, but we have got so much current it gorges together and we don't get as good ice now as we did before when we could catch dead water.

Q. Do you drink the water of the Illinois river?

A. Yes, sir.

Q. Does the water of the Illinois river produce typhoid fever in those who drink it?

A. There is very little typhoid fever that I have ever seen during all the time that I have been on the river.

Q. What is the general condition of the health of the fishermen?

A. Well, you don't find as many sickly fishermen as merchants.

Q. Do the firshermen generally drink the waters of the
5056 Illinois river?

A. Yes, sir.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You live here in Kampsville?

A. Yes sir.

Q. Do you live in a fish-boat?

A. No sir I live in a house.

Q. You live in your own private dwelling?

A. Yes sir.

Q. Have you a well or a cistern at your house?

A. No sir.

Q. Where do you get your water?

A. For the house purposes we get it at the public well.

Q. That is you get your water for domestic purposes at the public well here in Kampsville?

A. Yes sir.

Q. From your examination by Mr. Johns, I understand you are familiar with the river for a considerable distance up the river?

A. Yes sir.

Q. How far; about how many miles?

A. About 160 miles, or 170.

5057 Q. Now the condition that you stated, that the water was in, with reference to its being stagnant and still and void of current, was true with reference to the river prior to the opening of the Chicago drainage canal, from this point to 160 or 170 miles up the river?

A. No I will not say that because I have not been up in that country since the opening—

Q. No prior to the opening, before the opening?

A. Yes sir from this to Henry Lock.

Q. How far is Henry Lock from here, approximately?

A. About 189 miles, somewhere near that.

Q. Now how far up the river from this point are you and have you been familiar since the opening of the canal?

A. Well, not more than ten miles up.

Q. How far down the river from this point have you been acquainted with the river since the opening of the canal and prior to the opening of the canal?

A. Eight or ten miles.

Q. What is the difference so far as the current or flow of the river is concerned, as compared with the time prior to the opening and since the opening?

A. About one-half.

Q. Now as I understand from your testimony in answer to Mr. Johns' questions, there is a good current in the river now?

5058 A. Yes sir.

Q. And prior to the opening of the canal, unless there was a raise in the river or a flood there was no current?

A. None to amount to much, that is.

Q. There is quite a good current here opposite Kampsville, is there not?

A. Yes sir.

Q. Do you know about what is the rate per mile per hour or could you tell?

A. About two miles now.

Q. Right here opposite Kampsville?

A. Yes sir.

Q. How far is Kampsville above the dam known as Kampsville dam?

A. One-half mile.

Q. Does that current or rate of flow continue from this point at Kampsville to the dam?

A. Yes sir.

Q. What is the rate per mile per hour above Kampsville?

A. About the same.

Q. All the way up?

A. Until you get above the back-water of this dam.

Q. It gradually increases as you go up?

A. Yes sir.

Q. There is not very much green scum or moss in the
5059 river now, is there?

A. No sir.

Q. What kind of fish seem to prosper best in the river at this place?

A. German carp.

Q. Do you know, as a fisherman what the German carp feed upon?

A. Yes, sir; all the scavenger stuff they can get.

Q. What do you mean by scavenger stuff?

A. Horse manure, or any kind of manure or anything of that kind.

Q. Filth?

A. Yes sir.

Q. Do they feed on animal matter too?

A. Yes sir.

Q. Do they feed on fish, minnows?

A. No sir, not that I know of; I have never seen any of them feed on them.

Q. You are a very busy man aren't you?

A. I work all the time, yes sir.

Q. You pay no particular attention to the number of cases of sickness in this community?

A. Well, it ain't such a big community but what you can tell when a case of sickness comes up.

Q. You only know what you hear?

A. Well—

Q. And come in contact with?

A. Yes sir.

5060 Q. When you say the water in the Illinois river since the opening of the canal is better than it was prior to the opening of the canal you don't mean to say that it contains less substances and matters, that are harmful when used for domestic or drinking purposes, or that it contains any such matter, but your opinion is based altogether on what you observed from the appearance of the water?

A. No sir, I don't take my opinion that way; only just from what I know and what everybody teaches me, that the swifter the current is the better the water, the purer water.

Q. And that is regardless of whether it has been polluted or not?

A. Well, if polluted, that you say is far enough away in rushing over gravel and sand it is bound to purify it more than if it would lay stagnated.

Q. You don't know those facts that you have been told; you have simply been told that?

A. Well, yes I know it from drinking out of streams.

Q. You don't know that the water does not contain deleterious substances, do you?

A. No sir.

Q. In other words you don't know whether it does or not?

A. No sir.

5061 Q. You don't know whether it contains more or less since the opening of the canal than before the opening of the canal?

A. Well, no; I ain't analyzed it any.

ED. HEATON.

5062 Kampsville, Illinois, July 16, 1903.

JAMES MORAIN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. State your name, residence and occupation?

A. James Morain; Columbiana, Green County, Illinois. Occupation fisherman.

Q. How long have you been a fisherman?

A. About fifteen years.

Q. At how many different places have you fished upon the Illinois river?

A. Keatches' Landing, about five miles below here, I first commenced.

Q. Have you been familiar with the Illinois river before the opening of the drainage canal in 1900?

A. Yes, sir.

Q. What was its condition then?

A. Well, before it opened this river was like a pond here; filthy stuff and a green scum.

Q. Did it smell?

A. Well, some; some smell especially about nine o'clock
of a morning when there was no draught that the breeze
5063 raises, was felt, there was a smell.

Q. How about the moss and slime and grass upon the nets?

A. The moss and slime was bad; plenty of it, all covered; it took two men to get them out something, that is now bad it was. Of course sometimes you know, it would be worse than when there would be no head raise.

Q. Since the opening of the drainage canal what has been the condition of the river?

A. Why ever since the opening of the canal we have had a much better current; the water has been much better in my opinion since the opening of the canal; that is, it don't smell.

Q. Do you drink the water of the Illinois river?

A. Well I use a well right on the bank of it.

Q. Does the water in the well seep in from the Illinois river?

A. Well sir, I don't know exactly, it is 24 feet deep. You can tell, there seems to be a strong vein in my well; it is mighty good water; it is in the lowest part of the ground; it is in Columbiana.

Q. When you are out upon the river fishing, do you drink the water from the river?

A. Well if it is warm weather we take ice and put in the water and use it; we put ice right in the river water; that is
all the way we have of getting drinking water.

5064 Q. When the water is warm, you take the water from
the river and put ice in it?

A. Yes sir, and when the water is all over the banks, when I live there at home I use the water with ice in it too, for the family. I stay there; it has to get awful high to run me out.

Q. Does the water of the Illinois river when you drink it, produce any disease?

A. No sir; I have lived right here fourteen years and I have never had a chill.

Q. Have you or any of your family had typhoid fever?

A. No sir.

Q. Do the fishermen on the Illinois river who drink its waters have typhoid fever?

Objected to because it assumes that the fishermen on the Illinois river drink the water.

Well sir, not as I know of; I don't know of anyone here that has had typhoid fever at this place.

Q. Have you assisted in putting up ice in the winter on the Illinois river.

A. Yes, I have; not this last winter I didn't.

Q. Since the opening of the drainage canal how is the ice?

A. Well sir, the ice is very nice if the river has no head raise on it; that is it is clear ice. Of course if we have a head-raise you know, there is more muddy water settles in it.

5065

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How large a place is Columbiana?

A. Oh, about five or six or seven families there most of the time.

Q. How far is Columbiana from Kampsville?

A. Just across the river.

Q. How far is Columbiana from Kampsville dam?

A. Well it is one-half a mile as near as you can get at it I guess. It is about 500 yards is all.

Q. Before the Chicago Drainage Canal was opened, I understood you to say there was very little current in the river?

A. We didn't have none; it was just like a pond in low water time.

Q. How is it now?

A. We have a good strong current.

Q. There is a good strong current from Columbiana and Kampsville to the Government dam at Kampsville, one-half a mile below?

A. Yes sir.

Q. There is a good strong current up the river from Columbiana and Kampsville?

A. Yes sir.

Q. It gets much stronger as it goes up?

A. Yes sir, it gets stronger; it was so dead that the nets would not stand up before this drainage came in, in low 5066 water.

Q. What fish thrive best in the Illinois river at this point? What species of fish; name the best fish that thrives, that you find, not the best fish?

A. That thrives the best?

Q. That's it.

A. I believe that the carp fish do.

Q. Do you know what the carp lives on, as a fisherman?

A. Well such as they can gather, the substance in the water, I reckon, and that they gather, floating in it; most anything that they can find floating, bugs and worms and such as that.

Q. Do they live on minnows?

A. No sir, none to amount to anything at all. The third year before the drainage came in our healthiest fish that we had, I think in the waters, died, I don't think that there is any healthier fish in the world than the cuigan. That year; I think it was the third year before the drainage came in, they died

Q. That was when the river was frozen over with ice?

A. Yes sir, but since that; since the drainage came in, it has never killed no fish.

Q. You are not acquainted with the river up any great distance?

A. To Meredosia.

Q. How far is that?

5067 A. That is, Oh I suppose forty miles, forty-five or fifty.

Q. Now since the opening of the canal they have had a good current at all times of the year from here to Meredosia?

A. Yes sir, a man knows it when he pulls it with a skiff.

Q. How was it before the opening of the canal?

A. Why the bigger part of it was a good deal like pulling in a lake.

Q. Or a pond?

A. Yes, or a pond, dead water. We would begin to strike some current then at Graysville, I think; that is the first current we would strike between here and Meredosia.

Q. In your statement that the water is better now than it was before the canal was opened, you judge from the appearance of the water and from the fact that there is a current?

A. Oh yes, the current is much stronger, and the fact is we didn't have none before.

Q. And that is your reason for saying that the water is better?

A. Yes that's my reason.

Q. You don't know whether it contains substances that are poisonous and injurious to the human system do you, when used for domestic purposes?

A. Well, it don't seem to be; I use it right smart during
5068 this last high water, when I used ice in it; I have got a family of six of us.

Q. That is during the high water that you used it?

A. Yes sir, during the high water, and my doctor bill is very little.

Q. Now this well that you speak of is how many feet deep?

A. It is 24 feet.

Q. Did you dig the well?

A. No sir.

Q. You have had occasion to examine it?

A. Oh yes, I have cleaned it out.

Q. What is the character of the soil in the bottom of the well?

A. It is sand, white sand.

Q. How far from the water's edge at low water mark is it?

A. Well at low water mark, it is about 85 yards from the river 50 feet from the slough that comes out right by the side of it, a deep slough.

Q. Now in low water time is there any water in the slough?

A. Yes sir, it never goes down; it turns right in from the river.

Q. It is about fifty feet from this slough?

A. Yes sir; the slough comes in here and the river comes this way the river runs north and south and the slough comes in from the southeast and runs northwest.

JAMES MORAIN.

5069 Kampsville, Illinois, July 16, 1903.

IRA DAVIDSON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Ira Davidson.

Q. What is your business?

A. Fisherman.

Q. How long have you been a fisherman?

A. About a year and a half.

Q. How long have you lived at Kampsville?

A. Well, Kampsville has been my post office since I lived here a year and a half.

Q. Where did you live before coming here?

A. Lived in St. Louis.

Q. And were you acquainted with the Illinois river before you came here to live?

A. Yes sir.

Q. Where did you get acquainted with the Illinois river?

A. I got acquainted with the Illinois when I was living in Green county prior to going to St. Louis.

Q. When was that?

A. I lived two years in St. Louis.

5070 Q. With the exception of the two years that you lived in St. Louis, you lived here in Kampsville?

A. No sir, I lived in Green county, just across the river here.

Q. How far from the river did you live?

A. I live eight or ten miles from the river but I crossed the river twice a week, every week for about three or four years.

Q. Before 1900, were you acquainted with the condition of the Illinois river?

A. Yes sir.

Q. Will you describe those conditions?

A. Well, before 1900 the condition of the river was low stage of the water and no current practically.

Q. Any scum on the water?

A. Yes sir.

Q. Describe it?

A. Green scum as a usual thing.

Q. What was the color of the water?

A. The water was dark.

Q. What effect did the water have on fish?

A. Well, now I don't know as I can give you a definite answer to that; I wasn't fishing or paying no particular attention to fishing at that time.

5071 Q. What has been the condition of the Illinois river water since the opening of the drainage canal?

A. The water has been clearer, and we haven't had any scum or grass.

Q. Any other differences you have noticed?

A. Well I can't say as there was.

Q. Has there been any odor to the water?

A. None that I have noticed.

Q. How much have you been on the river during the last two years?

A. Eighteen months.

Q. Daily?

A. Yes sir.

Q. Have you drank the waters?

A. Yes sir.

Q. How often?

A. Well as often as half a dozen times a day.

Q. Has it made you sick?

A. Never taken a dose of medicine since I have been here.

MR. JEFFRIES: I move to strike out the question and answer, as being immaterial and irrelevant, and incompetent, and constituting no proof of any material issue.

5072 Q. MR. TODD: About how many fishermen are engaged in fishing at this point?

A. I should judge forty.

Q. Are they in the habit of drinking the water of the Illinois river when out fishing?

A. Yes sir.

Q. Has there been any typhoid fever or sickness in this community during the last eighteen months that you know of?

MR. JEFFRIES: Objected to for the reason that the witness has not qualified himself on the disease of typhoid fever, and has not shown that he is familiar with it, or that he knows the character of the disease, and for the further reason that it is incompetent and not the proper manner of proving the fact sought to be proved.

A. No sir.

Q. What in your opinion— Has the opening of the drainage canal— What in your opinion has the opening of the drainage canal had to do with the Illinois river in regard to the condition of the river as to whether the river water has been made better or worse?

A. Better.

MR. JEFFRIES: Objected to for the reason that the question does not provide for the use to which it is to be put, and upon which the answer is to be based.

5073

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You live here in Kampsville?

A. Yes sir, this is my post office.

Q. You live in a boat-house?

A. No sir.

Q. Do you use cistern or well water or water from the town well?

A. Use water from the well there where we live.

Q. You have a well at your house?

A. Yes sir.

Q. You use that for domestic and drinking purposes?

A. Yes sir.

Q. I understood you to say that prior to the opening of the Chicago drainage canal, in January, 1900, there was very little or no current in the river at this place, and that it looked like a lake or a pond, is that correct?

A. Yes sir.

Q. What is the stage of the river at Kampsville now, as compared with what it has been ordinarily since the opening of the canal in January, 1900?

A. Well, the stage is two foot higher I should judge.

Q. (Question repeated.)

5074 A. Well, it is rather low at the present.

Q. Has it been much lower since the opening of the canal than it is now?

A. Well, year before last, yes sir.

Q. That was in the drought of 1901?

A. Yes sir.

Q. There is a good current in the river now, is there?

A. Yes sir.

Q. A good current in the river here at Kampsville?

A. Yes sir.

Q. That current continues from here to the government dam about one-half a mile below?

A. Yes sir.

Q. And grows stronger as you go up the river away from the dam?

A. The farther from the dam you get the stronger the current.

Q. Do you know what the depth of the water is now that is flowing over this dam?

A. The depth on the dam?

Q. Yes.

A. No sir, I couldn't tell you.

Q. You have seen it have you not?

A. Yes sir.

5075 Q. What is your judgment as to its depth?

A. I wouldn't answer that because I couldn't give you nothing definite about it.

Q. It is considerable isn't it?

A. Yes sir.

Q. Several feet isn't it?

A. Three or more is several isn't it?

Q. Yes.

A. Well it is several feet then.

Q. You don't know whether the water contains any substance that is injurious to health or not?

A. It never injured my health.

Q. Well you don't know whether it contains it, I said?

A. I have never analyzed it; I don't know anything about it.

Q. It never injured your health before the canal was opened did it?

A. I never drank it before the opening of the canal.

Q. You were not fishing then?

A. No sir.

Q. What kind of fish thrive the best in the Illinois river water at this point?

A. I think the carp are thriving the best.

Q. What character of food do the carp live upon as compared with other fish?

A. I have never saw anything they wouldn't eat, yet.

5076

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. What other fish thrive here besides the carp?

A. Cat, Buffalo, bass, perch.

IRA W. DAVIDSON.

5077 Kampsville, Illinois, July 16, 1903.

W. L. FLATT,

called as a witness in behalf of the defendants, being first duly sworn by the commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. W. L. Flatt.

Q. Where do you live?

A. Columbiana over here.

Q. What is your business?

A. Well, I fish.

Q. How long have you been a fisherman?

A. About ten years I guess.

Q. Are you on the Illinois river most of the time?

A. Yes sir, most of the time.

Q. Are you acquainted with the Illinois river?

A. Yes this part of it.

Q. How long have you been acquainted with the Illinois river?

A. Well, I guess about forty years.

Q. Do you know the condition of the Illinois river before the opening of the drainage canal, January, 1900, and since the opening of the drainage canal?

A. Yes sir.

5078 Q. Will you describe the condition of the water of the Illinois river before the opening of the drainage canal?

A. Well, in low water we have a scum, a good deal more or less upon the water; in low water and hot weather.

Q. What kind of odor did the water have?

A. What kind of a color?

Q. Color?

A. A kind of a green.

Q. Did it have any smell to it?

A. Yes sir.

Q. Was there any dead fish in the water at that time?

A. Yes sir, there was.

Q. How many?

A. Well I couldn't tell you how many, but quite a lot of them though.

Q. Since the opening of the drainage canal what has been the effect upon the waters of the Illinois river,—the turning into the waters of the Illinois river the waters of Lake Michigan?

A. Well it is a more clearer water; the water hasn't been so muddy.

Q. Has the green scum been on the water?

A. No sir.

Q. How about its color?

5079 A. Well it has a clear color more or less; only when it rains.

Q. Has it improved or injured the water?

A. It has improved it I think.

Q. Have you drank the water?

A. Yes sir.

Q. How often?

A. Oh I couldn't say how often; quite a number of times though.

Q. When do you drink the water?

A. Well, when we are out and get dry we have to take a drink of it.

Q. Has it ever made you sick?

A. Not since the canal has been put through.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Did it make you sick before the canal?

A. Yes sir, it did, the ague; I don't know whether the water did it or not.

Q. How old are you?

A. 53.

Q. Do you live here in Kampsville?

A. No sir, in Columbiana.

Q. You live in a residence or a boat house?

A. I live in a residence.

5080 Q. Have you a well at your house?

A. Yes sir.

Q. A living well?

A. Why it is only when the water gets over it, in high water.

Q. You don't know whether the water contains deleterious matter or not do you?

A. No, I don't.

W. L. FLATT.

5081 Kampsville, Illinois, July 16, 1903.

ISAAC STABLER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Isaac Stabler.

Q. Where do you live?

A. I live in Columbiana, Green county.

Q. Is that across the river from Kampsville?

A. Yes sir.

Q. How long have you lived there?

A. I have lived there since the 8th day of last October.

Q. And before that time where did you live?

A. In Montezuma for seven years.

Q. Is that on the Illinois river?

A. Yes sir, right on the bank of the Illinois river.

Q. What is your business?

A. Fisherman.

Q. How long have you been engaged in that business?

A. About 28 years.

Q. During that time you have been acquainted with the Illinois river?

A. Yes sir.

5082 Q. What was the condition of the Illinois river before the opening of the drainage canal in 1900; describe it in your own way?

A. Well as near as I can recollect the water was pretty badly stagnated; about that time that the river, as near as I can recollect in pulling backwards and forwards there was a heavy green scum on the water and since that time I haven't noticed it; since this drainage has been turned in I haven't noticed that scum.

Q. What was the color of the water before the opening of the drainage canal?

A. Well, it was a kind of a green dingy color before the opening of the canal.

Q. Was there any odor connected with it?

A. Yes sir.

Q. What kind of an odor?

A. Well I couldn't hardly tell; but the water was of a bad smell, and it didn't have a good color; I remember that much.

Q. Since the opening of the drainage canal, what has been the effect of the waters of the drainage canal upon the waters of the Illinois?

A. Well I think it gave it a good current, and I think it carried off the filth, and it don't have the green scum that raises on the water, we don't have it now; in fact I think 5083 it made the water more pure than it was before. If we have a freshet here it doesn't take it near as long to clear up as it did before. That is my recollection.

Q. How about the color of the water?

A. Well the color is much better than it was before. The water in fact is more pure than it ever was before.

Q. Is there any odor to the water?

A. No sir, none whatever.

Q. Have you drank the water?

A. Yes sir, drink it yet occasionally.

Q. How does the water taste?

A. Why it tastes a great deal better than it did before as near as I can recollect; it is more clear and pure.

Q. Has the drinking of the water had any deleterious effect upon you?

A. None whatever.

Q. The fishermen generally drink the water?

A. Yes sir, of course when we are out raising we have to drink it; as a general thing the fishermen don't carry water; we drink it right out of the river; sometimes we take water with us, but seldom it is.

Q. Have you had anything to do with making ice in the river?

A. Yes sir, every year.

5084 Q. How does the ice compare that has been made since the opening of the drainage canal, with the ice that was made before the opening of the drainage canal?

MR. JEFFRIES: Objected to as incompetent of this witness. This witness not being qualified to judge.

A. Well I think that our ice is more pure.

Q. In what way?

A. Why, it is more clear; we don't get no moss in the ice since that and we did always before; it was impossible to get it without moss, or a green substance of some kind.

Q. Do you notice any difference in the condition of your nets since the opening of the drainage canal and before the opening of the drainage canal as to deposits?

A. Well yes, quite a difference.

Q. What is it?

A. Well, before the canal was turned in; our nets would all turn green and form a scum all through the meshes of the nets, so you couldn't hardly hold the nets; it was very near impossible to get a stob to hold one. The pressure of the water against the corroding on the nets would pull them always, we couldn't hardly hold one at all.

Q. What has been the condition since the opening of the canal?

A. Well we can place the nets most anywhere we choose
now, and the scum don't pull them any more; we are not
5085 bothered with no substance any more, only in early spring
time, we have leaves of course in spring, early season,
the leaves are bound to run you know, always in the early spring, but that is merely a few days at a time, and after our leaves settle we are bothered no more with anything corroding on the nets.

Q. What in your opinion has been the effect of the waters of the drainage canal upon the waters of the Illinois River.

MR. JEFFRIES: Object to the question as the witness has not qualified to testify in that respect.

A. Well I think it gives it more current, it gives it more power which leads off and carries away faster; I did think at one time that it was a disadvantage, but I don't now, but that was only the rising of the water in the spring, but I see the current now carries the water away a great deal faster than it did before it was turned in. We have a freshet here and when the back water runs up it don't take it but a short time to carry it off, or didn't this spring, and we had extra water this spring. I think it has been a little over four weeks since the water was bad, and now you see where it is; they are planting corn and before that we couldn't do that at all.

Q. What effect has the water had from the drainage canal in purifying the water of the Illinois river?

A. Well I think it has had a great deal of effect.

Q. In what way?

5086 A. Well it carried off all the stagnated water; that is,
it purified it. I think it purified the water simply because we have got a better body of water than we had before, and a stronger current, and the water can't help but be better than it was before because we have more of it.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How old are you?

A. I will soon be 45 years old.

Q. How long did you say you have lived on the Illinois river?

A. I suppose about 22 or 23 years, that is that I have been fishing; somewheres in the neighborhood of it.

Q. How far up the Illinois river are you acquainted with it?

A. As far as Peoria.

Q. How far is that?

A. Well sir, I don't exactly know; I didn't measure the distance and I couldn't tell exactly how far it is.

Q. Well about how far?

A. Well it is I suppose may be 100 miles, may be 110 miles.

Q. How far down the river from Kampsville are you acquainted with the Illinois river?

5087 A. Well I am acquainted to the mouth of it.

Q. What is the difference between the current or flow of the water in the Illinois river from Peoria to Grafton since the opening of the canal as compared with the flow of the water prior to the opening of the Chicago drainage canal?

A. Well I think it is more stronger; it has a stronger current and it carries away faster, if I understand your question right.

Q. Carries what away faster?

A. It carries the water faster.

Q. I understood you to say in your answer to Mr. Todd's questions, that before the canal was opened, the water in the river was stagnant?

A. I did say so.

Q. And still. What I mean is, the water was still?

A. Yes, before, it was dead; before this drainage was turned in it was dead; of course it was stagnant.

Q. How much of a current have you now?

A. Well we have a right smart, more than we had before, but I don't know just exactly the power that a man would drift; the difference in the drifting of the current.

Q. There is a very heavy current?

A. Yes sir, there is a strong current now.

Q. There is a strong current in the Illinois river here
5088 opposite Kampsville, is there not?

A. Yes sir, there is a strong current.

Q. How far is Kampsville above the Government dam?

A. One-half mile, or in the neighborhood of it.

Q. How does the stage of water in the Illinois river today compare with the ordinary stages of that water since January, 1900, the date of the opening of the canal—the month of the opening of the canal?

A. Why we have a better stage than we had before.

Q. I mean, is the stage of the water higher or lower now than it has been for the last two years since the opening of the canal?

A. Well it is a little somewhat higher.

Q. I don't want you to refer to anything that existed before the canal was opened; I am now speaking of conditions that existed exclusively since the opening of the canal?

A. I think it is about the same.

Q. What do you mean by that?

A. Why I think it is about the same as it was.

Q. Was when?

A. Since that canal was turned in; I think it is about the same stage; it may be a little shade higher.

Q. You mean by that that it is a little shade higher now
5089 than it was the month the canal was opened?

A. Yes sir.

Q. Now then, isn't it about as low now as it generally gets, since the opening of the canal?

A. No, it will get somewhat lower yet.

Q. How much lower?

A. Well it will go four feet—three feet anyhow; I will say three feet.

Q. There will always be a current, though?

A. Yes, sir, a good current.

Q. Here at Kampsville?

A. Yes, sir.

Q. Now, as you go up the river from Kampsville, the current grows somewhat stronger?

A. Yes, sir.

Q. Does the current continue from here to the dam?

A. Yes, sir, the current will carry you right over the dam.

Q. You live here in Kampsville, I understand?

A. Columbiana, just across the river.

Q. You live in a residence?

A. I live in a cabin boat on the bank.

Q. What fish or species of fish thrive best in the water here?

A. Carp.

5090 Q. Do you know what carp feed on?

A. Well they feed on anything most; anything in the shape of something to eat.

Q. Do they feed on minnows?

A. Yes sir.

Q. As well as they do on other matters?

A. Well no, not so much; they feed principally on grass; feed in the moss, you know and they go in the mud after mussels, etc.

Q. You don't know whether this water contains deleterious substances or not do you?

A. I don't think it does now.

Q. Well you don't know whether it does or not?

A. Well I have been around it a good deal and I never found anything like that if I understand you right.

Q. Did you ever examine it chemically?

A. No sir, never did that.

Q. You speak simply from observation?

A. Of course there is men that tested it, but I never did.

Q. Of course you are not speaking from what those men said?

A. No. ISAAC STABLER.

5091 Kampsville, Illinois, July 16, 1903.

JOHN M. HIPPLE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. John M. Hipple; I live in Kampsville for the last three years; I am a pilot on the river in the employ of the government.

Q. What is your employment by the government?

A. Pilot in the season time, and in the winter time I look after the fleet, day watchman on the fleet.

Q. What is the fleet?

A. We have three dredges, three steamboats and quarter boats and scows,—barges or scows.

Q. How long have you been in the employment of the government as a pilot?

A. Three years last May.

Q. Did you prior to becoming a pilot, have any other occupation upon the Illinois river?

A. Well I have lived on the river all my life and ferried and fished and steam-boated.

Q. How old are you?

5092 A. I am 38 years old. I was 8 years old when I came to the State of Illinois; I have only been on the river 30 years; I said all my life; ever since I was big enough to work.

Q. While engaged on the Illinois river, have you traveled its entire navigable length considerably?

A. I have traveled to La Salle, Illinois.

Q. Where did you fish in the Illinois river?

A. At Beardstown, that is below there some, below Beardstown.

Q. Have you had opportunity to observe the operations of the government in dredging?

A. Yes sir, I have been with them.

Q. Where have you observed the dredging operations?

A. Well the most of it has been below here, between here and the mouth of the river.

Q. What is the character of the material taken from the Illinois river by the dredge boats?

A. Well in some places down below, we find mostly sand and mussel shells and some places we strike mud, and some places it would be very thin mud and some places stiffer, and gumbo, but the most of it was sand and mussel shells.

Q. Had you anything to do with the dredging operations before the opening of the drainage canal?

A. Yes sir, worked with them one season down there.

Q. At what point?

A. Well you might say between the locks here and the 5093 mouth of the river, or Six Mile Island; Six Mile Island is at the mouth of the river.

Q. What was the character of the material dredged before the opening of the drainage canal?

A. Well I couldn't say as there was much difference; I couldn't say whether there was any difference or not. Of course I saw it and handled the mud, like you saw the boys this morning, and take that away, but the mud was different in so many places.

Q. Does the character of the bottom of the Illinois river vary at different places upon the river?

A. Why yes, at some places it is mud and at some places it is sand, and at some places it is hard mud, what they call gumbo, you can't shovel it, you can't cut it and you can't wash it.

Q. Prior to the opening of the drainage canal, was there in the bottom of the Illinois river a large amount of sediment?

A. Why, there was in places, but not in the channel, but out at one side and behind the island, and where there was slack water, and the river had filled in, there was, but it hadn't filled in in the channel; around the creeks and where the creeks empty it fills in some and changes.

Q. What was the condition of the water on the Illinois river before the opening of the drainage canal?

A. Well at low water it got very filthy and green.

5094 Q. What caused the filth?

A. No current to drive it away, I think.

Q. Was the filth from decayed vegetation or from sewage?

A. Well I think it was from both, but mostly from sewage.

Q. Were you familiar with the stretch of river from Peoria to LaSalle?

A. Yes sir.

Q. What was the condition?

A. Well in low water it was filthy and dirty.

Q. At what part of that stretch of the river did it seem to be more filthy?

A. About the Henry lock; about the Henry dam.

Q. Did the character of the water improve as you got near Peoria and if so in what respect?

A. Well, when we got over the Henry dam it got better, when we got down to Peoria, or down near to Peoria.

Q. Were you familiar with the stretch of river from Peoria to Copperas Creek dam?

A. Yes sir, very.

Q. Prior to the opening of the drainage canal what was the condition of that stretch?

A. Very bad, very bad.

Q. How was it as compared with the stretch of river immediately above Peoria and up to Chillicothe?

5095 A. Well it was a good deal worse down below Peoria than it was above.

Q. On what account?

A. Well I think it was from the sewage from Peoria; no current to drive it away.

Q. Since the opening of the drainage canal, how is the water below Peoria and the Copperas Creek dam?

A. Well, I was over it yesterday and it is a great deal improved; it looks as well as this river down here.

Q. Before the opening of the drainage canal, were you familiar with the stretch of water from the Copperas Creek dam to La Grange dam?

A. Yes sir.

Q. How far is it from Peoria to Copperas?

A. The Government has got it surveyed down here; but the steamboat men call it 30 miles, from Copperas Creek to Peoria.

Q. How far from Copperas Creek dam to LaGrange dam according to the steamboat men?

A. 82 miles.

Q. How far from LeGrange dam to Kampsville dam?

A. 60 miles the steamboat men call it.

Q. Prior to the opening of the drainage canal, what was the condition of the water between Copperas Creek and La Grange?

A. Well it is a good deal better than it was above; after
5096 it went over the dam, it didn't get bad again until it
got down to Beardstown, or near the other lock. Down to the LaGrange lock.

Q. Since the opening of the drainage canal, what is the condition of that stretch of water?

A. Well it seems to be a great deal improved.

Q. Before the opening of the drainage canal, what was the condition of the stretch of water between La Grange and Copperas Creek?

A. Before the opening?

Q. Yes? Between LaGrange and Kampsville?

A. It wasn't near as bad as it was up above Copperas Creek, but it is better now than it was then. The river is in better condition now than it was then.

Q. What was the condition of the water between LaGrange and Kampsville dam prior to the opening of the drainage canal?

A. Well, as I said before, it ain't as bad as it was before; it ain't as bad as it is up above, but it is in a better condition now than it was before.

Q. Prior to the opening of the drainage canal, what was the condition of the water between Kampsville and Grafton?

A. Well, it was in a better condition than it was above.

Q. How is that stretch of water since the opening of the drainage canal?

5097 A. Well, it is improved.

Q. You may state whether the water of the Illinois river, prior to the opening of the drainage canal, improves as it travels from LaSalle to Peoria Lake?

A. Why, yes, it improves.

Q. Since the opening of the drainage canal, you may state whether the water from LaSalle to Peoria Lake improves as it travels?

A. Yes sir.

Q. Prior to the opening of the drainage canal, which water was in the worst condition, that at LaSalle or that immediately below Peoria?

A. That immediately below Peoria.

Q. Which was in the worse condition, the water in Peoria Lake above Peoria, or the water below Peoria?

A. The water below Peoria was the worst; the water above Peoria was the best.

Q. Did the water as it traveled from Peoria to Copperas Creek dam, improve in appearance?

A. No, it seemed like it got worse until after it came over the dam and then it seemed to improve. It had to come to Pekin you know and there it got mixed with a lot more.

Q. At what place between Peoria and Copperas Creek dam was a large amount of sewage and offal added to the water in the river?

5098 MR. JEFFRIES: That is objected to as being incompetent and immaterial and does not tend to prove or disprove any issue in the case.

A. At Pekin.

Q. Before the opening of the drainage canal, did the waters of the Illinois river appear to improve between Copperas Creek and La Grange?

A. Yes sir.

Q. Before the opening of the drainage canal did the water of Illinois River appear to improve between La Grange and Kampsville?

A. Yes, sir.

Q. Before the opening of the drainage canal did the waters of the Illinois river improve between Kampsville and Grafton?

A. Yes sir.

Q. Since the opening of the drainage canal, do the waters of the Illinois river appear to improve between LaSalle and Peoria?

Objected to as leading.

A. Yes sir.

Q. Are the waters in that stretch of river better since the opening of the drainage canal than before?

Objected to as leading and suggesting the answer desired.

A. Yes sir.

5099 Q. Since the opening of the drainage canal, what has been the condition of the waters of the Illinois tween Peoria and Copperas Creek Dam as compared with their condition before the opening of the drainage canal?

A. Well, they are better; navigation is better.

Q. How about the appearance of the water?

A. Well, the water looks better.

Q. Since the opening of the drainage canal, what has been the condition of the waters of the Illinois river between Copperas Creek dam and LaGrange dam?

A. Why they are better, and purer and not so much vegetation and green stuff.

Q. How do the waters between Copperas Creek and LaGrange, since the opening of the drainage canal, compare with the waters between Peoria and Copperas Creek?

A. Well the further down this way the better the water is.

Q. How do the waters of the Illinois river since the opening of the drainage canal, compare with the waters before the opening of the drainage canal between LaGrange and Kampsville dam?

A. Well they are better since the opening of the canal.

Q. Since the opening of the drainage canal, how do the waters below Kampsville dam to Grafton, compare with the waters of the Illinois river before the opening of the drainage canal?

A. Well, it has improved it some; the waters are bet-
5100 ter, but you can't notice it here like you can on the up-
per end.

Q. Since the opening of the drainage canal, you may state whether the waters of the Illinois river gradually and steadily improved from LaSalle to Peoria Lake?

MR. JEFFRIES: Objected to because it is leading and suggestive and because it is misleading.

A. Navigation improved yes sir, wonderfully.

Q. What about the improvement in the condition of the water from LaSalle to Peoria?

A. Well, it looks clearer.

Q. Since the opening of the drainage canal, do the waters of the Illinois river improve between Peoria and Copperas Creek dam, and if not, state why?

MR. JEFFRIES: Objected to as being leading and suggestive.

A. Yes sir, they improve.

Q. What amount of offal and sewage do these waters receive at Pekin?

A. Well sir, you have got me; I don't know.

Q. Is the amount considerable?

A. Yes sir.

Q. Since the opening of the drainage canal, do the waters of the Illinois river improve in condition between Copperas Creek and LaGrange?

A. Yes sir.

5101 Q. And between LaGrange and Kampsville?

A. Yes sir

Q. And between Kampsville and Grafton?

A. Yes sir.

Q. Have you noticed the condition of the ice taken from the Illinois river since and before the opening of the drainage canal at various places?

A. Yes sir.

Q. Which is the clearer ice as a general rule, that taken before the opening of the canal or afterwards?

A. I couldn't say as to that; I couldn't see any difference.

Q. Do you drink the waters of the Illinois river?

A. Yes sir.

Q. How long have you been indulging in that practice?

A. All my life, ever since I was eight years old.

Q. Do the fishermen upon the Illinois river drink its waters?

A. As a rule they do, yes sir.

Q. Among the men now in the employ of the government of the United States upon the dredging fleets, do they drink the waters of the Illinois river?

A. Most of the time, yes sir.

Q. Does it produce typhoid fever among these men?

MR. JEFFRIES: Objected to for the reason that the witness is not qualified to testify upon that point, and whatever he might say in regard to that would in no wise be competent evidence. 5102

A. If any of them ever had typhoid fever, I never heard of it.

Q. In your acquaintance and long experience upon the Illinois river, which class of the community, those living upon and drinking the waters of the river or those living upon land in the hills are the healthier?

MR. JEFFRIES: Objected to as incompetent and immaterial as the witness is not a physician, and therefore unable to testify or make comparison as to the health of the people, or to draw any conclusions as to the cause of such condition of health as may exist.

A. Well, I couldn't say, sir.

Q. What is the use of the dams in the Illinois river?

A. To back the water up over the bars.

MR. JEFFRIES: Objected to as immaterial.

Q. Do these dams retard or stop the flow of the river up to their aprons?

A. Yes sir.

Q. How far does the water of Kampsville dam, back up the waters of the Illinois river?

A. I think they aim for to back it to LaGrange.

Q. What is that distance?

A. Fifty miles.

5103 Q. How far does LaGrange dam back up the water?

A. Oh, I should judge fifty or sixty miles; I don't know just how far it is.

Q. How far does the Copperas Creek dam back up the water?

A. Well I suppose forty or fifty miles; I don't think it backs it up as far as these do.

Q. Does it back it up as far as Peoria?

A. Well, I couldn't say.

Q. How far does Henry dam back up the water?

A. Well I don't know just exactly.

Q. About how far in your judgment?

A. I should judge about forty miles.

Q. What is the effect of high water in the Illinois river upon its channel?

A. It causes the channel to fill up.

Q. Does the flood in the Illinois river wash out the channel and remove whatever sediment there is in it?

A. No sir.

Q. What is the effect of high water in the tributaries of the Illinois river as to the making of deposits and the creating of bars in the Illinois river?

A. The high water is the cause of them filling and forming.

MR. JEFFRIES: We object to the testimony of this witness in this respect for the reason that he has not quali-
5104 fied himself as being able to testify in that regard and especially unable to give an opinion as to whether or not the floods and high waters wash out the deposits in the bed or channel of the river, or as to whether or not the flood caused the deposits to be made in the channel or bed of the river, or as to whether or not the floods or high waters in the tributaries of the Illinois river, create such deposits; the witness having shown none of the necessary qualifications which would authorize that character of testimony.

Q. JUDGE JOHNS: What is the purpose of dredging in the Illinois river?

A. To deepen the channel so steam-boats can run.

Q. At what places is the dredging done?

A. Well, wherever it fills in.

Q. Is it done where bars are formed?

A. Yes sir.

Q. Where do these bars form in the Illinois river, above or below the entrance of the tributaries?

A. Well, it is generally below them.

Q. When the government has dredged a channel through a bar below a tributary of the Illinois river, what do you know with reference to that channel after a flood in the tributary?

A. Well you don't know whether it is there or not until you get in and see.

5105 Q. In your experience in dredging on the Illinois river, what do you find as to the channel below the entrance of tributaries, filling up after high water or flood in the tributary?

A. You mean what kind of sediments, what you get out of there?

Q. As to whether the channel fills up; do you find the channel filled up again?

A. Yes sir, quite often it does; it don't fill up every time a creek comes out.

Q. Do you mean by that every time the high waters of a creek come out?

A. I mean it don't fill up every time a creek comes out.

Q. Well you mean the high waters of a creek?

A. Yes sir.

Q. When you find a channel filled up below the entrance of the tributaries, and after a flood in the tributary, what is the fact as to where the filling matter comes from?

A. Well, that is pretty hard to tell; I couldn't say where it did come from.

Q. To what do you as a government employe attribute the filling up?

MR. JEFFRIES: Objected to for the same reason stated in the previous objection touching the qualifications of this witness to testify on a subject of this character.

5106 A. Well the creeks throws the mud out, it comes down out of the hills, fills the creeks and settles there until they get current enough to carry it away.

Q. In the times of flood, does the Illinois river wash out all the sediment deposited between its banks and carry it away?

MR. JEFFRIES: Objected to as leading.

A. Not always.

Q. In times of flood, what is the effect upon the deposits in the Illinois river, outside of the running channel; are they increased or diminished by the flood?

A. Well it was increased by this year's flood, but as a general thing it is diminished.

Q. Does that depend somewhat upon the character of the flood?

A. Yes sir, here it does.

Q. Does a flood have the effect to increase or decrease the amount of sediment in the back waters or slack waters created at the time of flood?

MR. JEFFRIES: Objected to for the same reason as heretofore stated and because it is leading, the witness being wholly disqualified from testifying on that subject.

A. Yes sir.

Q. You mean by that it increases the amount of sediment?

A. It did this year here.

5107

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Where did you say you lived?

A. Kampsville.

Q. How long have you lived at Kampsville?

A. A little over three years.

Q. Where did you live before you lived at Kampsville?

A. Beardstown?

Q. Were you born and raised at Beardstown?

A. No sir.

Q. How long have you lived at Beardstown?

A. Oh, I was there four or five or six years and I lived down below about six miles; raised down below about six miles.

Q. Below here?

A. Below Beardstown.

Q. What did you say your business was or profession?

A. Pilot.

Q. You are not a civil engineer?

A. No.

Q. How long have you been piloting?

A. About nine years.

Q. You have charge of a fleet here now?

A. No sir, I am on a steamboat now.

Q. In the employ of the government?

A. Yes sir.

5108 Q. How long was you in the dredging business for the government?

A. Well I have been with them going on four years and I go out every season dredging.

Q. And you commenced in 1899?

A. I commenced three years ago last May.

Q. That would be May, 1899, wouldn't it?

A. Well, you can figure it up.

Q. Well I am asking you?

A. I told you.

Q. You told me what?

A. In May.

Q. In what year?

A. Well I said three years ago last May.

Q. Well, what year would that be?

A. I don't know.

Q. You can't tell?

A. I could, yes sir.

Q. Well, I would like you to tell me.

A. Well, I don't think it is important.

MR. JOHNS: Yes, answer the question.

A. No, I wouldn't answer that question.

THE COMMISSIONER: Answer the question.

Q. MR. JEFFRIES: The question may seem foolish to you, but we have to have them answered. I am not trying to humiliate you at all. 5109

A. Well, it looks like it.

MR. JEFFRIES: You are badly mistaken in that; I have no such intention at all.

JUDGE JOHNS: The witness is instructed that he must answer all questions and leave to the Court the propriety of the question; the law requires the witness to answer every question to the best of his ability.

Q. MR. JEFFRIES: What year would that be?

A. Are you waiting on me?

Q. Yes.

A. Well, you needn't to wait on me, I told you when it was.

Q. What year would that be?

A. In 1899.

Q. Then you commenced the service of the government in May, 1899, as I understand it?

A. Yes, sir.

Q. Now, what was the character of your employment when you first commenced working for the government?

A. I was pilot on a dispatch boat.

Q. Was that the name of the boat or the character of the boat?

A. Yes, sir.

Q. Now, explain what you mean by the dispatch boat?

5110 A. What is called the dispatch boat; it carries the mail and provisions and does the chores.

Q. It was a small boat then, was it?

A. Yes, sir.

Q. Did it do any towing?

A. Yes, sir.

Q. Did it do anything in connection with this dredging work?

A. Yes, sir.

Q. Now, what did it do?

A. It helped the other steamboats, removed the dredges and done anything to be done.

Q. It was stationed at the dredge boat, was it?

A. The most of the time.

Q. In fact, all the time except when it would be engaged in some other work?

A. Well, some days we would be here; some days at the fleet, and may be some days up at Beardstown or wherever they were a mind to send us, wherever business called us.

Q. When did you commence the first dredging?

A. Three years ago last May.

Q. Immediately after your employment?

A. Yes, sir.

Q. Do you know whether or not the government had been dredging in the Illinois river prior to that time?

A. Yes, sir.

5111 Q. Could you state where?

A. Why, yes, I could state a good many places.

Q. Name some of them?

A. Devil's Elbow, Sugar Creek, Meredosia, Wilson's Island, Eagle Island and Diamond Island and Herriken Island, Morton's Island, Gilfords, Otter Creek, Twelve Mile Island and Six Mile Island; that's all I can think of now.

Q. Do you know when the dredging was done at Devil's Elbow, approximately, say?

A. No, sir; I couldn't just say the year; I couldn't.

Q. Do you know what that dredging was done for?

A. To deepen the channel for the boats to get through.

Q. Well, at that place they dug out the natural bed, it was not a deposit, was it?

A. In some places they went over it and had to re-dig it out; it might have been a deposit; most of the places it was a natural bed, but in some places it was a deposit.

Q. That applies to nearly all these places?

A. Yes, sir, they pretty near all fill up and they have to re-dig them.

Q. I don't know whether I understand you or you understand me; what I mean this dredging was done in the natural bed, before any deposit was put there, in order to make a deeper channel than had formerly been at any time in the past?

5112 A. Well, around these creeks, where this dredging is done there is a cause; what caused it once, causes it again; a creek comes out and fills it up and if it don't come out any more for four or five years, we don't have to go back there. What caused it once will cause it again.

Q. Now, where was the first place that they commenced dredging after you commenced work for the Government?

A. Mortland's Island.

Q. How long did they work at that place, dredging?

A. Well, I don't just remember just how long they did work there; I should judge a month or five weeks, something like that.

Q. Do you remember the character of the soil or earth that you took out of the river?

A. Why, it was mostly a mixture, or mostly sand; some places it was loose, but most of the places it was sand.

Q. Now where was the next place?

A. Six Mile Island.

Q. Do you remember when that was?

A. It was when I first went to work for them.

Q. Immediately after the Mortland Island work?

A. Yes, sir.

Q. And during that same year?

A. Yes, sir.

Q. Now, was that the same character of soil?

5113 A. No, I think there was more mud down there at Six Mile.

Q. Now, is Six Mile Island above or below Mortland's Island?

A. Below.

Q. From Six Mile Island you went next to what place?

A. From Six Mile I forget whether we moved back up to

Twelve Mile, or whether we moved to Herriken; we worked that over, that country twice that year and twice the next year. We made so many moves, I don't remember.

Q. Now, where is Twelve Mile Island with reference to Six Mile Island?

A. It is six miles this side of Twelve Mile Island.

Q. And the other side of Mortland's?

A. Yes, sir.

Q. And where is Herriken?

A. Herriken is about three miles below here.

Q. Below Kampsville?

A. Yes, sir.

Q. Now, at Herriken there was a great deal of mud there?

A. Yes, sir.

Q. How was it down at Twelve Mile Island?

A. There wasn't a great deal of work there; it was most all sand.

Q. Now, did you do any dredging up the river from Kampsville?

A. Nothing only up at the lock; we went up and dug the mud out of the lock; that is, since I have been working for them.

5114 Q. Yes, I understand. You dragged the mud out of the locks here at Kampsville?

A. No, sir; I never did; I am dragging it out now; when we dug it out before the other man dug it out, and they sent me up to the other lock.

Q. What is the character of the mud that comes out of those locks?

A. It is very thin.

Q. Dark color?

A. Well, it is awful dark; still it is the mud color.

Q. Just the mud color?

A. Yes, sir.

Q. How deep is it?

A. The mud we are digging out now?

Q. Yes.

A. Oh, it varies, some places five or six feet deep. I don't know just exactly, but I judge from the way they bring it up.

Q. Now, what do you do with that mud?

A. Take it out into the river, out of the channel and dump it is about the only thing.

Q. You made the same disposition of all the mud that you took out of the river?

A. Yes, sir; just move it out of the channel.

5115 Q. How deep was the mud at this other lock or dam, up the river from Kampsville, that you cleaned out?

A. Oh, it was four or five feet or more.

Q. What dam was that?

A. LaGrange.

Q. Now, in this work of dredging, your work was entirely in the pilot house, was it?

A. No, sir; I got down when some of the men got involved; I had to go down and give them a start, and show them how to work it, was the only difficulty.

Q. Did you supervise it?

A. Yes, sir.

Q. How much more flow or current is there in the river now along here at Kampsville than there was before the canal at Chicago was opened; I don't mean in exact miles, just approximately?

A. Well, before the canal was opened the water was all green out here; just plumb green like a pond.

Q. There was no current?

A. No, sir; not right above the dam; the further up the more current you get. The water at the lowest here, was practically at a standstill.

Q. How has the current been since the opening of the canal?

A. Why, there has never been no dead water here.

5116 Q. There has always been a good current ?

A. Yes, sir, a fair current when the water was low; it was not a good current, exactly.

Q. When you spoke in your examination in chief in answer to a question from Mr. Johns, you spoke of the water being better now than it was prior to the opening of the canal, you meant from an observation of the water and not from a scientific examination of that water?

A. No, sir; not from scientific; no, sir; I don't know anything about that; I know it is better navigating and it is better to drink and it looks better.

Q. How old are you?

A. 38 years. JOHN M. HIPPLE.

5117 Kampsville, Illinois, July 16, 1903.

C. V. BRAINARD, called as a witness in behalf of the defendants, after being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. C. V. Brainard.

Q. What is your business?

A. Civil Engineer.

Q. Did you have charge of the taking of water above Kampsville Lock for the Sanitary District of Chicago, and the University of Illinois and the University of Chicago?

A. Yes, sir, I did.

Q. What years was water taken?

A. Well, parts of 1900 and part of 1899.

Q. At what points above the lock were samples of water taken, Mr. Brainard?

A. Well, they were taken about four or five feet above the lock, and from two to three hundred feet from the bank, that is, different weeks; they weren't exactly the same place each week, as near as we could get it, though.

Q. How often were samples taken?

A. Once a week.

5118 Q. What instructions did you have in regard to how the samples of water should be taken?

A. The instructions were on the back of the card that was sent and provided that the bottle should be immersed in water before the stopper was taken out and afterwards rinsed out, after a little water allowed to flow in and submerged in the same manner—filled in the same manner and the stopper put in the bottle before the bottle was taken out of the water.

Q. Where did the bottles come from?

A. They came from the different places to which they were sent.

Q. Did they come by express?

A. Yes, sir.

Q. Whom were they expressed to?

A. To me.

Q. Were the corks—were the stoppers in the bottles when they came?

A. They were.

Q. And were not removed until the bottles were filled?

A. They were kept in the bottles until they were filled.

Q. After the bottles were filled, were the bottles sealed?

A. They were.

5119 Q. After they were sealed, was there tags or cards placed on them?

A. There were.

Q. How were the bottles prepared for shipment?

A. One of them was packed in ice, the one that contained the small sample was packed in ice.

Q. And the other?

A. The other was put in a box with excelsior.

Q. And what was done with them after that?

A. They were taken to the express office and shipped to each place?

Q. What express office?

A. They went by the Adams Express Company.

Q. And to whom were they shipped?

A. There was one sample sent to Chicago University, one to the Board of Health of Chicago and one to the University of Illinois.

Q. On these cards which were attached to the different samples of water after they were sealed, was the sample number, the date, the place from which the sample was taken, the hour of taking, with the name, C. V. Brainard, on the card, the height of water, the temperature of water, the direction of wind, temperature of air, all properly indicated upon the cards in the same manner as they are indicated upon the card I show you which is card for sample No. 1242?

A. They were.

5120 Q. And did each card contain instructions for collecting and sending samples of water for analysis, the same as are printed on this card?

A. They did.

MR. TODD: I will ask to have this card marked "Sanitary District Exhibit 6 for identification."

Card is so marked by the Commissioner.

Q. In the collection of these samples were these instructions complied with?

A. They were.

Q. How long have you been connected with the government improvement on the Illinois river?

A. Since February, 1891.

Q. Are you acquainted with the physical conditions of the Illinois river before and since the opening of the drainage canal?

A. Yes, sir.

Q. What was the condition of the water of the Illinois river before the opening of the drainage canal?

A. Well, it was very bad; at low water it got very bad.

Q. In what way?

A. There would always be a greasy sort of a scum on the top of it; it would frequently be green the whole depth of the river.

5121 Q. What kind of an odor did it have, if any?

A. Well, I couldn't describe the odor, but there was always more or less of an odor to it.

Q. What has been its condition since the opening of the drainage canal as compared with the condition that existed before the opening of the canal?

A. It hasn't been as bad since the opening of the canal, as it was at times before.

Q. In what way or manner?

A. There has been more current in the river and there hasn't been that bad look to it; it has always looked clearer and better than it did before.

Q. How about its color?

A. Well, the color has been better; it hasn't had that greenish color that it had before. Before the drainage water was turned in we frequently had grass growing in the river up to the side of the channel where the steamboats kept it worn away; since the water of the drainage canal has been turned in I have seen none of that.

Q. What is your opinion as to whether the water of the drainage canal has improved or injured the waters of the Illinois river?

A. I don't think it has injured it at all; as to the improvement, I—there has been improvement for the time it has been in, over what it was for certain years before.

5122 Q. You live in Kampsville, do you not?

A. Yes, sir.

Q. Have you known of any typhoid fever in Kampsville since the opening of the drainage canal?

MR. JEFFRIES: I object to the question as not the proper way of proving such facts.

A. There has been one case.

Q. Since the opening?

A. Yes, sir.

Q. That was the doctor, was it not?

A. Yes, sir; he had been attending typhoid patients back from the river and we suppose he got it from that.

Q. About how many fishermen are engaged in this vicinity, in the business of fishing?

A. Well, I suppose there is ten or a dozen of them.

Q. Are you acquainted with the Illinois river from its mouth to La Salle?

A. Yes, sir.

Q. Have you any idea of the number of the people who live along the Illinois river in flat-boats or house-boats?

A. I have no idea of the number; I know it is very large, probably several thousand.

Q. They live there with their wives and children, do they not?

A. Yes, sir.

5123 Q. And form a floating population?

A. Yes, sir.

Q. Before the opening of the drainage canal, did you ever observe any dead fish in the Illinois river to any considerable extent?

A. Well, at times there was a number of dead fish; I never paid particular attention to anything of that kind.

Q. Have you seen any since the opening of the drainage canal?

A. Well, I can't say that I have noticed any since the opening of the canal.

Q. How long have you been in the employ of the government at this point?

A. Twelve years and a half.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Did you take these samples of water yourself?

A. No, I didn't. That is, I didn't go out personally and do the work.

Q. You had that done by someone else?

A. Yes, sir.

Q. Then you put all these various data on these cards yourself?

A. Yes, sir.

Q. Did you take the temperature of the water yourself?

5124 A. No, sir; that was taken when they took the samples.

Q. Then as to whether or not the instructions were carried out so far as taking the water is concerned, you can't personally say?

A. I can personally say in a large number of instances because I watched them taking it.

Q. How much stronger is the current in the river now here at Kampsville than it was prior to the opening of the Chicago drainage canal?

A. Well, do you mean above or below the dam?

Q. Well, both, the current generally.

A. Well, it has increased a great deal.

Q. How much stronger is it above the dam?

A. Well, it has increased considerably since. There has been no observation taken to determine that. It is simply by observation,—by looking at it.

Q. You have a cistern or a well at your home?

A. No, we haven't any.

Q. You use water from the town wells?

A. Sometimes we use that and we use it from the river at times; I live down at the locks, right on the bank of the river.

Q. When you say the water is better now than it was before the opening of the canal you simply judge from its appearance?

A. Yes, sir.

5125 Q. Without reference to its sanitary or unsanitary condition or anything of that kind?

A. That I know nothing about because I have made no analysis of it.

RE-DIRECT EXAMINATION, by Mr. Todd.

Q. In using the water where you live at the lock, how long have you used it for domestic purposes?

A. Why, we have used it ever since we have been there.

Q. Has it ever caused sickness in your family, typhoid fever?

A. Well, I don't know whether the water caused it or not, we have all had chills and fever.

Q. Of whom does your family consist?

A. Myself, my wife and three children.

C. V. BRAINARD.

5126 Kampsville, Illinois, July 16, 1903.

FRANK TOZIER, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. Frank Tozier; residence, Kampsville; occupation, steamboat engineer.

Q. How long have you been an engineer on steamboats?

A. For about fifteen or twenty years, all told.

Q. How long have you been a steamboat engineer on the Illinois river?

A. All the steamboating I ever did was on the Illinois river.

Q. As a steamboat engineer have you traveled the entire length of the river from LaSalle to Grafton a good many times?

A. Yes, sir; but not of late years.

Q. Are you now in the employ of the government?

A. Yes, sir.

Q. In what business?

A. As engineer; blacksmith.

Q. Is the government engaged now in dredging the Illinois river at various places?

A. Not at present; only dredging now is just at the mouth of the locks. We have done no dredging last year nor

5127 the forepart of this year.

Q. How long have you been engaged in dredging operations on the Illinois river?

A. I dredged over eight years as a steady work.

Q. At what points upon the river have you dredged?

A. Commence at the upper end of the river from Devil's Elbow and every bar to the mouth of the river.

Q. Where is Devil's Elbow?

A. It is about eight miles this side of Havana, below Havana.

Q. What is the purpose of dredging?

A. To make a channel.

Q. What kind of material or dirt do you get out of the channel of the Illinois river where you dredged?

A. We get clay, sand, clam shells and soft mud.

Q. Have you ever dredged any of these places more than once?

A. Yes, sir.

Q. If so, what ones?

A. I have dredged Devil's Elbow twice, Sugar Creek twice, and all below this lock we have dredged over some of them we have dredged two and sometimes as high as four times.

Q. What causes the channels that you have dredged, to fill up?

A. The creeks.

Q. When the creeks are in flood do they carry out dirt which fills up the channels?

5128 A. Yes, sir.

Q. Where are the bars in the Illinois river with reference to the creeks, above or below the creeks?

A. Below the creeks.

Q. What causes the formation of bars in the Illinois river?

MR. JEFFRIES: Object to the question because it is asking for the opinion of a witness who has not qualified himself properly as being informed so as to testify in a way that his testimony would be competent.

A. I think very nearly the whole cause is the sediment that comes out of the creeks. After each high water there will be a sediment of an inch to two inches; sometimes may be three inches all over the banks, on the flats will be an inch to three and four inches of a sediment, after a long high water. This year there was about three inches.

Q. When there is high water in the Illinois river, does it wash out the sediment or cause more sediment to settle?

A. I think it causes more sediment to settle; there isn't current enough in this river to wash out anything.

MR. JEFFRIES: I object to the question, and move that both it and the answer be stricken out, because the witness has not qualified as being able to testify upon that subject, not having shown a sufficient knowledge upon the flow of the water, the
pressure of the water in a running stream, to remove sedi-
5129 mentation, and that the testimony is incompetent, and
for the foregoing reason, immaterial.

Q. JUDGE JOHNS: Have you ever dredged out a place upon the Illinois river where afterwards you were not able to find the channel again?

A. Yes sir.

Q. Where was that?

MR. JEFFRIES: Objected to as being immaterial.

A. That was at Otter Creek bar; we dredged it out and then moved up on the other bar and then in two or three weeks we had to go back and dredge it again.

Q. What caused that channel to fill up?

MR. JEFFRIES: Objected to for the same reason as stated in a previous objection to testimony of that character from this witness.

A. Otter Creek; a storm came right after we left there, and after the storm we went back there and couldn't find where we had dredged; that was two or three weeks after we left it; I think it was two weeks.

Q. Did that channel fill up because of a flood in Otter Creek?

MR. JEFFRIES: We object to that question as leading; in addition to the objections previously raised as to the competency of the witness to testify on that subject, it being solely an opinion without being based on sufficient scientific 5130 knowledge to be relied upon.

A. Yes sir.

Q. When you have once dredged out a channel in the Illinois river through a bar, what causes the bar to again form in the channel?

MR. JEFFRIES: Objected to for the same reason as heretofore stated.

A. Because there has been a flood in the creeks; I have dredged bars where it was quicksand and came right back.

Q. Do you drink the water of the Illinois river?

A. We do when we are out; not at the present time, but when we are dredging, most of the time we drink the water right out of the river.

Q. Do you use the river water with or without ice?

A. With ice.

Q. Do you use ice when the water is cool?

MR. JEFFRIES: Objected to because it is leading.

A. No sir.

Q. Does the water of the Illinois river give you any disease?

A. No sir.

MR. JEFFRIES: Objected to because it is leading, and because the witness not being a physician would be unable to tell what was the cause of the disease if he had one.

5131 Q. How many boats are there in the fleet of the government now on the Illinois river?

MR. JEFFRIES: Objected to as immaterial?

A. Three barges, three steamers, eight dump-scows; four flats, two quarter-boats and an officer's boat.

Q. How many men are employed upon this fleet?

MR. JEFFRIES: Objected to as immaterial.

Q. When the fleet is all working?

A. We have from 40 to 45 men.

Q. Do these men generally drink the water of the Illinois river?

MR. JEFFRIES: Objected to because it is leading.

A. Yes sir.

Q. So far as you have observed, does it have any bad effect upon them?

MR. JEFFRIES: Objected to for the reason that the witness is not a physician and is not able to observe or to know the effect of water of any kind upon the human system or to know whether a certain disease has been caused from drinking bad water or from some other cause.

A. No, it doesn't; most of them are having good health, the whole thing through. Once in a while there will be one that will have a chill.

5132 Q. What is the condition of the water in the Illinois river now compared with its condition before the opening of the drainage canal in 1900?

A. Well, in 1900, before the opening of that canal, at this time of the year you could find this whole river here as far as you could see covered with a green slime all over it. Whenever the hot weather commenced, it would be covered with that green slime, which we don't have and haven't had for the last two years. May be one of the hot days you may see a little streak of that green right where the channel comes, but very little of it.

Q. What is the quality of the water now as to being fit to drink?

A. The water now with ice in it, I believe would be perfectly healthy right at the present time.

Q. Take it the year around, is the water in the Illinois river now used for drinking purposes?

A. Well, I don't know how that is; take those that don't happen to be out on boats; I suppose that they use well water where they can get it, but I believe it will be fit to drink the year around. After the weather begins to get cold in the fall, we drink it right out of the river; we have no ice at all; we take our water right out of the river.

5133 MR. JEFFRIES: Object to the question for the reason that it is leading and move to strike out the answer except that part where the witness stated he knew nothing about it, for the reason that it is not responsive, and for the reason that the witness is not qualified to form an opinion as contained in the objection to all the testimony of this character, which has heretofore been urged.

Q. What is the purpose of putting dams in the Illinois river?

MR. JEFFRIES: We object to the question because it is immaterial and for the reason that the witness is not qualified as being possessed of sufficient information to know with any degree of accuracy what the reasons for building the dams were.

A. That was to raise the river so boats could run. I can remember the time when the boats, before that Henry dam was put in, couldn't hardly get above there at all without sending men out ahead to shovel it; I have seen it when there wasn't a foot of water in the river at the crossing there on that bar.

Q. Does the dam at Kampsville back up the water in the Illinois river and if so, how far?

A. It will make at Meredosia about six inches of water; a raise of seven feet here will make it about 6 inches at Meredosia.

Q. How far from Kampsville dam to Meredosia by river?

A. It is about 42 miles.

5134 Q. How far is LaGrange dam from Meredosia?

A. About seven miles.

Q. How far does the dam at La Grange back up the water in the Illinois river?

A. Well I couldn't tell you exactly how far that was; I know it was calculated to back clear to Copperas creek lock, but it don't do it.

Q. Do you know the height of the La Grange dam, if so state it?

A. Seven feet.

Q. Do you know how far the Copperas Creek dam backs up the water?

A. Well, the water is just between Henry and Lacon; it backs up, the last showing of it is between Henry and Lacon; that is about four miles above the Henry lock, dam.

Q. How far from Copperas Creek dam to Henry dam?

A. About 70 miles.

Q. Does the dam at Henry back up the water?

A. It backs it, I don't know how it is now; but it used to back plumb to La Salle.

Q. How far from Henry dam to La Salle?

A. About forty miles.

Q. How high is the dam at Copperas Creek?

A. It is supposed to be seven feet, all of them.

Q. Do you mean that all the dams on the Illinois river
5135 are seven feet high?

A. Yes sir, seven feet high.

Q. From what point to what other point do you measure the seven feet?

A. From dead low water.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You say you are an engineer on one of the government boats?

A. Yes sir.

Q. You run the engine on the boat?

A. Yes sir.

Q. How long have you been employed by the government in that capacity?

A. Twenty years; since 1883.

Q. You stated a moment ago in answer to one of Judge Johns questions that the government had done no dredging on the Illinois river for the last year and a half?

A. No sir; unless it is something like what we are doing right now; that we don't call dredging; cleaning up right around locks and the like of that.

Q. Do you remember the date when the last piece of dredging was completed?

A. No, I don't, but it was—

5136 Q. About when?

A. About three years ago when the last piece of dredging was completed.

Q. That would be in June or July, 1900?

A. That would be; we finished down below along in October I think.

Q. 1900?

A. 1900.

Q. Now that is the last that has been done except around the locks?

A. Except cleaning around the locks.

Q. How is the channel of the Illinois river now, compared to what it was in 1900?

A. I can't tell that, because we didn't sound to find out; last year there was a high water, the whole year through, and this year we didn't sound, and so I can't answer that.

Q. Prior to 1900, how many years were there that there was no dredging done, if any?

A. Prior to 1900, we dredged for seven years right straight; about seven years that we dredged every year, and then there come a year that we had no money.

Q. You mean you had no appropriation?

A. We had no money to work on.

5137 Q. Now when you say you had no appropriation, you don't know whether it was because the War Department failed to recommend an appropriation to Congress because it was not needed, or whether it was overlooked, or why it escaped? You have no information on that subject as to what recommendations were made to Congress on the question of appropriation?

A. Well, if I remember right, that year— As a general thing you know, a river and harbor bill is only every two years, and in that year if I remember right, it was vetoed, the bill was—well it was the last year of Cleveland's administration; that is when it was. We had no money at that time.

Q. You are not a hydraulic engineer are you?

A. No sir.

Q. Are you a man of family?

A. Yes sir.

Q. Live here in Kampsville?

A. Yes sir.

Q. Have you a well or cistern at your house?

A. We have a well.

Q. You use that for drinking and domestic purposes?

A. Not at the present time; I would rather take it out of this river than out of the well; I am using out of another well though.

5138 Q. Using it out of the town well?

A. Well, I get it—

Q. Using it out of a neighbor's well?

A. I am using it out of Mr. Rose's well.

Q. A neighbor's well?

A. Yes sir.

Q. Is that a living well or a cistern?

A. Well, he has had his cleaned since this high water.

Q. When you say this high water, you mean this high water this last spring?

A. Yes sir.

Q. The high water from the Illinois river?

A. Yes sir.

Q. Is there any current in the river opposite Kampsville, near where this boat right now stands?

A. In the channel?

Q. Yes.

A. Very little.

Q. How much water is pouring over the dam now?

A. That I couldn't tell you; I haven't been down close enough to see, and I don't know exactly what the gauge is.

Q. Have you been fishing with hook and line here lately?

A. No sir.

Q. Have you seen anybody else fish?

5139 A. Yes sir, I have seen people fishing.

Q. Have you noticed that there is sufficient current here at Kampsville, one-half a mile above the dam to draw the fishing line with two lead sinkers of ordinary size, down the stream?

A. Well I haven't seen anyone fishing here right in the river.

Q. Is there any other dredging outfit belonging to the government on this river other than the one here?

A. No sir, only this one; there is another outfit that belongs to the state.

FRANK TOZIER.

5140 Kampsville, Illinois, July 16, 1903.

VALENTINE TOTZELL,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:—

Q. What is your name?

A. Valentine Totzell.

Q. What is your business?

A. Fisherman.

Q. How long have you been a fisherman?

A. Well I have been a fisherman ever since 1874.

Q. On the Illinois river?

A. Yes sir.

Q. Where do you live?

A. In Kampsville.

Q. Living here all the time?

A. No I used to live at Columbiana, across the river.

Q. Have you been acquainted with the waters of the Illinois river for the last ten years?

A. Yes sir.

Q. Can you describe the waters of the Illinois river prior to the opening of the drainage canal, in 1900?

A. Yes sir.

5141 Q. What was it?

A. Do you want me to answer that?

Q. Yes?

A. Why it was, I considered very stagnated water before the drainage canal was let in; green; I have seen it here one season when the water was green fully six inches deep. If you dipped up a bucket of water, it would be perfectly green.

Q. Did it have any odor in it?

A. There were times that there was a kind of a bad smell coming in kind of puffs like. I suppose it would be from the water.

Q. What has been the effect upon the waters in the Illinois river by the opening of the drainage canal?

A. Well, we have had better water, that is, say six or eight weeks after the canal was let in; we had pretty bad water for about six weeks; the water was colored; at the same time it was cold weather; it was a kind of a coffee color brown; but then six or seven weeks after that it cleared out and we have had good water ever since; we have got a better current now than we generally have.

Q. Has there been any smell to the water?

A. Well no, no smell that I could catch; I drink the water now regular; the time before the ditch was in we couldn't drink it at all; we had to take water with us, seining or raising nets.

5142 Q. What effect has drinking the water of the Illinois river had upon your health?

A. Why it has had no effect that I can see; I have always been hardy since I have been on the river. I had chills 25 or 30 years ago, but I haven't had them since; I don't know as the river had anything to do with that.

Q. What in your opinion has been the effect of turning the drainage canal water into the Illinois river?

A. I think if it had any effect at all it would give us better water.

Q. What do you mean by better water?

A. Why purer water and more of it; we haven't had the stagnated water here since, that we had before, of course.

Q. Before the opening of the drainage canal, what effect did the then Illinois river water have upon the fish nets?

A. Well there was several times when the river was very low; we had no current at all, and it was naturally dead water above the locks here. Three times that I have raised, all the fish in my nets were dead; not a living fish in them, and it would be of course on account of the stagnation of the water, that I laid it to.

Q. What has been the effect of the waters of the Illinois river before the opening of the drainage canal, upon the nets themselves, as to whether there was any scum formed
5143 upon the nets?

A. Well, yes, there was a kind of a slime formed on the nets. If nets weren't fishing you generally found a slime on the nets. If they were fishing good, of course the fish kept the slime off.

Q. What has been the condition since the opening of the drainage canal upon fish in the nets and in live-boxes?

A. Well, they have kept better in live boxes, and you could leave them in nets longer without raising them, and they wouldn't bruise themselves or die with disease as they would before; simply because we have got the current to purify the water more.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You say you live here at Kampsville?

A. Yes sir.

Q. You live in a residence out here in the town?

A. Yes sir.

Q. Have you a well or cistern at your house?

A. No sir I live on a lot where one well supplies the whole business; and I use the water from that well.

Q. You see the water from that well for domestic purposes at home?

A. Yes sir.

5144 Q. When you say the water is better now than it was before the canal was opened, you have reference simply to the water from your observation of it and not an examination that you have made as to what it contained?

A. I can drink it now when I couldn't before; the year around. I could drink it before, but there were times in the year that I could not.

Q. What species of fish thrive best in the waters of the Illinois river here at Kampsville?

A. Well the best to multiply that we have and the most fish that we have is German carp at the present day.

Q. What do they feed on?

A. Well, they feed on everything that I have tried yet. I have not found anything yet they wouldn't feed on. Potatoes, meal, flour, or anything else.

Q. Animal matter—do they feed on animal matter?

A. Yes sir.

Q. How is the current or flow of the river now, as compared with it prior to the opening of the Chicago drainage canal?

A. Well, of course now, the current; before the dam was put in we generally had a current; since the dam was put in we have no current at all in dead low water; now we have a fair current in dead low water, which we didn't have before the ditch came in.

5145 Q. Since the opening of the canal, there has always been a good current in the river here at Kampsville, has there not?

A. Well tolerably fair; we have a strong current when the river is up and a slack current when the river is down. It is lower now than it was any time last year, but I couldn't say how it was the year before.

Q. The people living here in town have their wells and their cisterns that they use water out of, don't they?

A. Yes sir.

V. TOTZELL.

5146 Kampsville, Illinois, July 16, 1903.

O. C. BARTHOLOMEW,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. O. C. Bartholomew.

Q. What is your business?

A. Fisherman.

Q. How many men have you employed in your business?

A. From three to five.

Q. Where is your place of business?

A. Half a mile north of Kampsville.

Q. How many nets do you fish with?

A. About eighty.

Q. How long have you lived in Kampsville?

A. Ten years and one month.

Q. Were you acquainted with the Illinois river during the ten years that you have lived here.

A. Yes sir.

Q. Have you known it before and since the opening of the drainage canal?

5147 A. Yes sir.

Q. What was its condition before the opening of the drainage canal and describe its condition since the opening of the drainage canal and the effects of the drainage canal upon the waters of the Illinois river at this point?

A. Before the opening of the canal here at times or during the summer season, it would be scum on it, and I have seen nothing of that kind since.

Q. Was there any smell connected with the water before the canal was opened?

A. In the winter after a heavy freeze there was.

Q. What effect has the opening of the drainage canal had upon these waters at this point?

A. We have had right smart of a current, and we have had no scum on the water since.

Q. Did you see the scum before?

A. Yes sir.

Q. How extensive?

A. Well, it was heavy; at places next to the shore it would be half an inch or three-quarters deep and extending on out towards the center and be shallower. A boat would make a trail through it of a morning when no wind.

Q. What are the conditions now since the drainage
5148 canal has been opened?

A. Well we have no scum any more; there seems to be a pretty fair current; it appears better.

Q. How about the condition of the water?

A. It also appears better.

Q. What do you mean by better?

A. Well it don't seem to be as stagnant.

Q. Do you ever drink the water?

A. Yes sir.

Q. Since the opening of the canal?

A. Yes sir.

Q. How frequently?

A. Well, it is only through the winter season, when out at work, I drink it then.

Q. Do the fishermen drink the water?

A. Possibly do when out on the water in the winter season.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. All the people around here have wells or cisterns, in town here, do they?

A. Yes sir, I believe so.

Q. They use the water from those wells for domestic purposes and drinking purposes?

5149 A. Yes sir.

Q. They don't use the water from the river for that purpose?

A. As I stated a minute ago, we used it when we was out in the winter time; we did not take any water with us then. Of course these people here in town have wells and use that.

Q. You don't know whether the water contains deleterious matter or not?

A. No sir.

Q. What is the difference between the flow or current of the river now as compared to what it was before the Chicago drainage canal was opened?

A. I don't know what it would average to the mile now, but before, stuff went whichever way the wind was. This is speaking of low water.

Q. In other words there was no current?

A. Apparently there was no current.

Q. Now since the opening of the canal you have a good current?

A. Yes sir, we have a fair current all the time.

Q. Both in high and low water?

A. Yes sir.

Q. There is a current here opposite this place, is there not?

A. Yes sir.

Q. How far is it from here down to the dam?

A. Half a mile.

5150 Q. And the current extends all the way down?

A. Yes sir.

Q. And up the river also?

A. The further up you get the stiffer current you get until you reach the other lock.

Q. How does the stage of the water compare now to what it was last year and the year before?

A. Well it is about the same now as it was last year at this time—well not at this time either, because we had high water last year during July and August.

Q. As a matter of fact isn't the Illinois river lower now than it has been at any time in the last three years?

A. No sir. Two years ago it was lower than it is today.

Q. That was in 1901?

A. Yes sir.

Q. During the drought?

A. Yes sir.

Q. Which lasted for several months?

A. Several months.

O. C. BARTHOLOMEW.

5151 . Kampsville, Illinois, July 16, 1903.

WILLIAM MAPPIN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:—

Q. What is your name?

A. William Mappin.

Q. What is your business Mr. Mappin?

A. Fisherman.

Q. Where do you live?

A. I live at Kampsville.

Q. How long have you lived here?

A. Well I have lived here about seven years.

Q. Are you acquainted with the river for that time?

A. Yes sir.

Q. What was its condition before the opening of the drainage canal in 1900?

A. You mean about the water, do you?

Q. Yes?

A. Well it was pretty bad.

Q. Describe it?

5152 A. Well at times the water would get down pretty low and there was a right smart scum on it; no current.

Q. Did it have any odor to it?

A. Yes sir.

Q. Did you drink it then?

A. Well, once in a while we did, when we were seining, when the water got down low at times when we were seining, once in a while we would get caught out and have no water and we would take a drink of it.

Q. How about the water now since the opening of the drainage canal?

A. Well, I think the water is purer, better.

Q. In what way?

A. Well, there is not the sediment; we don't have any scum on the river like we did then. Of course it doesn't get down now like it did then. I suppose that is the reason.

Q. Do you drink the water now?

A. No sir.

Q. When you are out on it?

A. No sir; well I have a time or two, here week before last we ran out of water and I took a drink of it.

Q. What in your opinion has been the effect upon the Illinois river, of the opening of the drainage canal?

A. Well I don't know—

5153 Q. As to whether the water is better or worse than it was before?

A. Well, I think the water is better; I don't see why it wouldn't be; we have got a good current in the river; the water has got down now that it only lacks sixteen or eighteen inches I think to being down to what we call low water here.

Q. How long does this period of low water last?

A. Well it don't last very long.

Q. What do you mean by that?

A. Well, I don't think it lasts over a couple of months, or a little bit longer than that. Along in the fall we will get a raise.

Q. Do you have high water the other ten months in the year?

A. Yes we have high water; you might say now the water is getting down pretty low; what we call low water.

CROSS-EXAMINATIIN,
By Mr. Jeffries.

Q. When you say you have high water the remaining ten months in the year, you mean that the water is above low water mark?

A. Oh, yes.

Q. You don't mean that it is overflowed or anything of that kind?

A. Oh, no.

Q. You mean that it is at the ordinary stage?

5154 A. Yes sir.

Q. During the remaining ten months?

A. Yes sir. July and August as a general thing the water gets down about the lowest. September, along in there as a general thing, it gets a raise.

Q. When you say the water is better than it was before the canal was opened, you mean simply from your observation of that water?

A. Yes sir.

Q. And your belief is based altogether upon the fact that there is no more stagnant water and that you have a continuous current through the year?

A. Yes sir.

Q. You live here in town?

A. Yes sir, I live right above here a little ways; I don't live right here in town—well I live here in the town too, inside of the corporation.

Q. Do you live on the river?

A. Yes sir, been on the river all my life.

Q. In a boat on the river?

A. No, it is right up on the bank, some ways from the river.

Q. Prior to the opening of the canal there was very 5155 little current here during certain seasons of the year?

A. There wasn't any at all you might say; the water got down so low here there wasn't any current at all. Whichever way the wind blowed, that was the way the current.

Q. How is it now?

A. Well, it's a pretty good current now.

Q. There is a current right out here in front of town isn't there?

A. Yes sir.

Q. A good current, no stagnant water out there is there?

A. No, I don't see as there is. It is stronger now than it was.

Q. Does that current continue from here down to the dam?

A. That I couldn't say from here, but I suppose it does.

Q. You don't fish down there?

A. No sir, I don't fish down there.

Q. Fish above?

A. Yes sir.

Q. The current gets stronger as you go up above?

A. Yes sir.

WM. MAPPIN.

ADJOURNED until following morning, July 17, 1903, at same place (Kampsville, Ill.) at 8:00 A. M.

Kampsville, Illinois, July 17, 1903.

8:00 A. M., Friday.

5156 Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

DR. T. O. HARDESTY,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner was examined in chief by Mr. Johns, and testified as follows:

Q. Doctor, state your name, residence and occupation?

A. T. O. Hardesty; residence Kampsville; occupation physician.

Q. Of what school of medicine are you?

A. Marion Simms, school, St. Louis, Missouri.

Q. How long have you practiced medicine?

A. Since April 1896; that is I graduated in April 1896, and have practiced since.

Q. How long have you lived in Kampsville?

A. Since April, 1896.

Q. Have you been in the general practice of medicine at this point for 7 years?

A. Yes sir.

5157 Q. Covering about what extent of territory?

A. Within a radius on the north of ten miles; on the south nine miles and the west eight miles, and on the east two miles.

Q. What proportion of the population use for domestic purposes the waters of the Illinois river?

A. In this territory, Kampsville?

Q. In this territory?

A. A very small proportion.

Q. Do you know whether the fishermen use it when engaged in their business?

A. In my opinion they do.

MR. JEFFRIES: We object to the witness expressing an opinion, when that question is subject to positive proof.

Q. Have you had any cases of typhoid fever in this community within the last three years or within the last seven years? If so, how many and where?

A. I have had no typcical cases of typhoid fever. You understand, of typical cases?

Q. Yes I understand. Have you had cases of malarial fever?

MR. JEFFRIES: Object to the question as immaterial and as leading.

Q. And typho-malaria?

5158 A. We have every summer a number of cases, roughly speaking, we call them typho-malaria; these cases no doubt are a modified form of typhoid fever.

Q. Where have they been most frequent, among the people using the water of the Illinois river or among those who do not use it?

MR. JEFFRIES: Objected to as leading.

A. The cases that I have had to do with have been practically altogether situated in the hills, back three or four miles from the river; from a mile and a half to four miles back.

Q. Since January, 1900, what has been the general health of this community as compared with the preceding four years?

A. My observation has been that within the last three years there has been less sickness than there has been in the time before that I was practicing here.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How old are you, doctor?

A. I am 33 years old.

Q. Were you born and raised in this town?

A. I was not; I was born and raised in Lincoln county, Missouri.

Q. What did you say your name was?

A. T. O. Hardesty.

5159 Q. You haven't been here then quite six years?

A. Yes sir, I came here on the 28th day of April, 1896.

Q. I thought it was 1897?

A. No sir.

Q. Are you a married man?

A. No sir.

Q. You live here in town?

A. Yes sir.

Q. What is the size of this town?

A. I believe the census gives at about 320.

Q. The people here use well and cistern water for domestic and drinking purposes, do they not?

A. The most of them I presume do; I think do.

Q. As far as your information goes?

A. Yes sir.

Q. What do you mean by a typical case of typhoid fever?

A. We have in our text books given a fever that runs a certain peculiar course, with certain peculiar symptoms, that typhoid fever has; it is not—it does not belong to other diseases, and in this country the fever doesn't run that peculiar type, but we have the predominant symptom of typhoid fever, but they lack this peculiarity of running a given course, which is common to typhoid fevers which you find in the prairies.

5160 Q. How near to the river have any of these cases which you referred to in your examination in chief been?

A. The first case to speak of was one that occurred in town in 1897, the second summer after I was here, and the other cases were from a mile to five miles from the river. They have been in different years along.

Q. Do you know whether the people in this locality along the river use the water of the Illinois river for domestic and drinking purposes?

A. I think the people in town use principally well water, cistern water for domestic purposes, while I have seen those on the river in the government work use water dipped out of the river.

Q. The farmers, what do they use?

A. Mostly spring, living wells.

DR. T. O. HARDESTY.

5161 Kampsville, Illinois, July 17, 1903.

EDWARD DAUGHERTY,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Edward Daugherty; occupation carpenter; residence Kampsville.

Q. How long have you lived in Kampsville?

A. Twelve years.

Q. How long have you been on or near the Illinois river?

A. Thirty years.

Q. Have you had any occupation which kept you upon the river?

A. I have been employed by the government on the Illinois river since the spring of 1882.

Q. In what capacity?

A. As carpenter and cranesman, on the dredges.

Q. How long have you been connected with the business of dredging the Illinois river?

A. Twenty-one years.

5162 Q. Upon what parts of the Illinois river have you been dredging?

A. From Devil's Elbow to the Six Mile Island.

Q. Is that from about four miles below Havana?

A. Yes sir.

Q. To about six miles above Grafton?

A. Yes sir.

Q. During what season of the year was the dredging operations carried on in the Illinois river?

A. Principally in the fall.

Q. What is the purpose of the dredging?

MR. JEFFRIES: I object to the question for the reason that the witness has not qualified himself as being able to determine the purpose for which the order was made by the government for the dredging.

A. To deepen the channel.

Q. In deepening the channel do you dredge out bars which are formed in the river?

MR. JEFFRIES: Objected to as leading.

A. Yes sir.

Q. Where, as a general rule, do these bars form?

A. Below creeks.

Q. What occasions the formations at such points?

MR. JEFFRIES: Object to the question because the wit-
5163 ness has not qualified as a hydraulic engineer, or sufficiently informed so far as the testimony now shows, to be able to express an opinion on the subject, and whatever he might say would be no more than a guess.

A. The creeks overflowing and throwing out their sediment into the river.

Q. Have you had occasion during your experience to dredge out the same channels in the Illinois river more than once, if so where and how frequently at each place, commencing at the upper portion of the river and proceeding towards Grafton?

A. As far up as I can remember distinctly the first was at the mouth of Sugar Creek. I think we dredged that once after the original dredging; and the next place was down there at Otter Creek; I think we dredged that twice after the original dredging. I don't believe I remember any more places.

Q. Are there other places which you do not remember in which channels have been dredged the second or third time?

MR. JEFFRIES: Objected to as leading and suggestive.

A. Yes sir; we have dredged several places three or four times.

Q. Have these dredgings generally been below the mouths of tributaries of the Illinois river?

MR. JEFFRIES: Objected to as leading and suggestive.

A. Yes sir.

5164 Q. Are you familiar with the Illniois river and have you been upon it in all its various stages from high to very low water?

A. Yes sir.

Q. What is the effect upon the bottom sides of the channel of the Illinois river of floods in the river, as to the deposit of sediment?

A. I haven't noticed any serious results from the sediment.

Q. In times of floods or high water in the Illinois river, is the sediment which has been deposited by the action of the water washed out, or is more sediment deposited?

MR. JEFFRIES: Objected to as leading.

Q. In other words, does the river scour?

A. No sir.

Q. After a flood in the Illinois river, is there more sediment in the bottom and along its banks, or less, than before a flood?

MR. JEFFRIES: We object to the question for the reason that it is suggestive and leading and for the further reason that the witness has not stated that he is acquainted with the question of sedimentation so far as it affects the bed and banks and sides of the Illinois river, and we move to strike out his answer to the previous question to the effect that there is no scour in the Illinois river, for the reason that the witness has not qualified as being competent to testify upon that subject. 5165

A. More sediment every time there is a flood.

Q. Do you drink the waters of the Illinois river?

A. Not at the present time, no sir.

Q. Have you while upon the river in the course of your business in dredging?

A. All the time drink Illinois river water.

Q. In its filtered or unfiltered state?

A. Unfiltered state.

Q. How many men are in the employ of the government here on the Illinois river while dredging operations are being conducted?

A. About 45.

MR. JEFFRIES: Move to strike out the answer and the question as immaterial.

Q. What kind of water do these men drink when engaged in the business of dredging?

A. Illinois river water.

Q. In the course of your experience in dredging upon the Illinois river, how many cases of typhoid fever have you known among these men?

MR. JEFFRIES: Objected to for the reason that the wit-5166 ness has not qualified as a physician and is not a physician, and therefore is unable to know the symptoms of typhoid fever, or to testify in such way as to make the testimony reliable on that subject, and for the further reason that he has not qualified as being acquainted with the extent of sickness in this locality.

A. I was down two months with the typhoid fever myself.

Q. Answer the question first?

A. No sir I don't know of one case among our dredge men.

Q. Have you ever had typhoid fever?

A. Yes sir.

Q. When and where?

A. In Cass County, seven miles and a half east of the Illinois river.

Q. Describe its symptoms and the course of the disease?

MR. JEFFRIES: Objected to as incompetent and immaterial, the witness not being a physician, and able to describe the symptoms of the disease mentioned, other than from the fact that he was told by the physician attending him that he had typhoid fever.

A. Well I couldn't do that accurately; I was only about 15 years old when I had it. I know it left me bald-headed; I had a heavy head of hair, the hair all come off of my head; the skin came all off of my body and feet, hands and everything.

5167 Q. How long did the disease continue?

MR. JEFFRIES: Objected to as immaterial.

A. I wasn't able to be up for about three months after I was taken.

Q. Was a part of that time devoted to recovery from the effects of the disease?

MR. JEFFRIES Objected to as immaterial.

A. Yes sir. I didn't fairly get over it for five years.

Q. Have you seen among the men engaged in the employ of the government, any such disease as that?

MR. JEFFRIES: Objected to as incompetent, for the reason already stated, in connection with the witness testifying on this subject.

A. No sir.

Q. With what part of the Illinois river have you been familiar during your occupation as a dredger? Only from Devil's Elbow down?

A. Yes sir, from Devil's Elbow to Six Mile Island.

Q. Describe the condition of that part of the river before January, 1900 as to the quantity of water, the current and the color and odor of the water.

A. Well, the color of the water was green, stagnated; you take an oar and stir down in the water and it would be ropey; you would find a fine green fiber in it for about two feet
5168 down, and very little current unless we had big head raise up the river.

Q. What was its odor?

A. The odor one winter here when it froze up was terrible bad, after it got broke up in the spring, and the ice got broken so it could get out. That was the only time that I noticed any bad odor.

Q. Did you notice any odor in it in the fall?

MR. JEFFRIES: Objected to as leading and immaterial.

A. No, I didn't, that was after it broke up in the spring; it was froze all winter.

Q. What I mean to ask you is, did you notice year by year, before the opening of the drainage canal an odor in the water as if the vegetation in the river had decayed?

A. No, I didn't pay much attention to that, but it got so bad I couldn't help but notice it; living right on the river all the time I don't notice such things.

Q. Since the opening of the drainage canal, what has been the condition of the river?

A. The river in my estimation has been a good deal healthier.

Q. What with reference to the current?

A. We have better current, more current.

Q. In reference to its quality as a drinking water?

A. It is bound to be better drinking water when we have
5169 a better current in the river; it seems to be more pure.

Q. What is the character of the material dredged from the bottom of the Illinois river?

A. Well that varies. In dredging out a second and third time, it is a soft, mushy mud as near as I could tell you.

Q. Of what are the first dredgings composed?

A. Mussel shells and mud and dirt all mixed up together.

Q. Any sand?

A. Yes sir, quite a lot of sand.

Q. Any clay, and if so what kind, blue or yellow?

A. There ain't any clay in the Illinois river except at two places that I have dredged. I have helped to dredge all the cuts below LaGrange Locks, and down here at the head of Twelve Mile Island. I believe those are the places; I don't remember exactly where those places are. I never jogged my memory with it. About all the clay there is.

Q. Is it—the clay—blue or yellow clay?

A. It is blue up at LaGrange and down here below the clay is yellow.

Q. Is that different from gumbo?

A. Yes sir.

Q. Where do you find gumbo?

A. Find gumbo generally out in the country, back of the
Illinois river and way out sometimes fifteen or twenty
5170 miles, as far as Jacksonville and Springfield.

Q. Do you find gumbo in the bottom of the Illinois river?

A. No sir, I don't believe I ever noticed any.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. When did you first commence the service of the government?

A. In the spring of 1882 I believe,—1881 or 1882.

Q. On a dredge boat?

A. Well I began as a carpenter and then I went on the dredge boat after I started out, and after the return of the fleet I went back as a carpenter.

Q. You kept that work up for how long a time?

A. Well, there was some falls we didn't go out at all; I can't tell exactly how many falls we have been out; we have been out practically every fall when we had money to dredge on.

Q. There has been no dredging in the Illinois river the last year and a half or two years, has there?

A. No sir.

Q. When was the last dredging done?

A. I believe 1901 in the fall we was out; I am not sure now, either 1900 or 1901.

Q. Where was that?

5171 A. That was down below.

Q. At what point?

A. All the way along up, 1899 or 1900, I forget which, I can't tell you positively.

Q. It wasn't so bad in the way of deposits during that season as it had been prior to that time as I understand it?

A. Well, I don't know whether it was or not, I can't tell; I don't know whether that was the time we dredged some of the old cuts out or not, but I think we did.

Q. What was the character of the deposits that you dug out the last season that you worked?

A. Why it was just about the same as we had been digging right along all the time; the same cuts would have the same deposits, there was some sand and some would be mussels. We widened the channel the last dredging, finished up the cut 200 feet wide and of course where you struck a bar it would run 200 feet the same kind of material, whatever it was, sand, clay, mussels or soft stuff, whatever it was.

Q. Or mud?

A. Yes sir.

Q. Now you stated in your direct examination in answer to a question from Judge Johns, if I understood it correctly, that after these shallow places had been dredged out, the matter that was deposited there was mostly mud—those places
5172 that would fill up again?

A. Yes sir.

Q. That was generally true of all the places that you dredged?

A. The second dredging, yes sir, and third, it would be.

Q. Could you explain the character of that mud?

A. How is that?

Q. Can you explain the character of that mud, whether it was thick or thin?

A. Why it would be thin of course, sloppy. Thin mud.

Q. Sloppy?

A. Yes sir.

Q. How deep would it be?

A. Well in some places right close to those creeks, it would be almost level; that is the cut would be filled level with the original bottom of the river.

Q. What do you mean by being filled level with the original bottom of the river?

A. When we would dig down say three feet through this bar; then the creek would come down and fill that three-foot cut up again with the original bottom of the river; that would be the original bottom again, that cut.

Q. Then, as I understand it, you haven't been out on the river dredging these places for some time past?

5173 A. No, we haven't been out for two or three years, I guess with the fleet, that I remember; I don't remember the last time we were out; 1899 or 1900, along there somewhere.

Q. When you say the water is better now than it was before the Chicago drainage canal came into it, you judge altogether from its appearance and not from any examination you made with reference to what it contains?

A. I take my judgment from the look of the water and the current and the condition of the water before and now.

Q. Before the opening of the canal I understood you to say the water was stagnant?

A. Yes sir.

Q. In other words there was no current?

A. No current.

Q. How has it been since the opening of the canal?

A. We have always had a good current, couldn't pull a boat up against it hardly.

Q. How is the current here opposite Kampsville?

A. Oh I suppose we have got about a mile or mile and a half. About a mile as near as I can judge.

Q. An hour?

A. Yes sir.

Q. How far is it from here to the Kampsville dam?

A. It is a little over a quarter.

Q. Isn't it a half?

5174 A. Very near a half from here.

Q. The dam is below here?

A. Yes sir.

Q. The current continues from here to the dam and on over the dam does it not?

A. Yes sir.

Q. How is it above here; does it increase as you go up the river?

A. I don't think it does; as far up as I have been I never noticed any change in it; it is about as swift one place as another.

Q. It is pretty hard to pull a boat up against it?

A. Yes sir, pretty hard to pull a boat.

Q. When this mud and filth is taken up out of the bottom of the river in these places where you have dredged, what is done with it?

A. It is generally taken out and put in behind islands, when it is possible to get behind an island.

Q. If not, you dump in the current?

A. If not, then right up on the bank run the scow right up to the bank just as hard as we could run it, and dump them and leave it up on the bank as near as we can get it.

Q. Never did dump it in the current?

A. Well there would be a little current there certainly; fifteen feet from the bank there is some current.

5175 Q. You remember several times when you were out on this dredging work of employes that worked there having diarrhoea, don't you?

A. Why it seems to me like I remember a case or two of it; nothing serious.

Q. What kind of water do the people use here in this town for domestic and drinking purposes?

A. Well water.

Q. You are a man of family?

A. Yes sir.

Q. You use well water?

A. Yes sir.

EDWARD DAUGHERTY.

5176 **DR. T. O. HARDESTY,**

recalled for further examination by Judge Johns, testified as follows:

Q. Were you ill here at any time, and if so when and with what disease?

A. I was taken sick, I think, the 26th of September and was confined to my bed for eight weeks, about four weeks convalescent. The diagnosis was typhoid fever.

Q. In what year was that?

A. That was in 1902.

Q. Do you know where you contracted that disease?

A. Prior to getting sick I had treated two cases in August —the latter part of July and August, for what we diagnose in this country as typho-malarial fever. The weather was very warm and my opinion was that in drinking the water that I would find at these houses when I would go there, that I contracted the disease from these two patients.

Q. Where were these two cases which you treated?

A. They were five miles south of Kampsville and two miles and a half west of the river.

Q. Did the people having these two cases use the water of the Illinois river for drinking purposes?

A. They did not.

5177 Q. As to the urinary and fecal discharges from your own person during that illness, what became of it?

MR. JEFFRIES: Objected to as irrelevant and immaterial.

A. I think they were just thrown outside.

Q. Into some vault or on the ground?

A. No, on the ground.

Q. Were they disinfected?

A. They were not.

RE-CROSS-EXAMINATION, By Mr. Jeffries.

Q. These patients that you had out in the country, doctor, were they adults?

A. Yes sir.

Q. Male or female?

A. One was male and the other was female.

Q. You don't know whether they had opportunities to drink water away from home or not, during the proper time for incubation?

A. Away from their individual homes?

Q. Yes.

A. I think the gentleman did, the lady did not; he was running a threshing machine.

Q. Where was the threshing machine?

5178 A. Over the hills and country around through here, and where he was taken sick, principally in the hills.

Q. How far did he live from the Illinois river?

A. I would judge from the banks of the Illinois, at least two miles and a half.

Q. Were the two cases in the same family?

A. They were not.

Q. Were they sick at the same time in the same locality?

A. Yes sir, the sickness of one ran right into the other; one was sick and the other about a couple of weeks afterwards, and then they both run about two months and a half.

Q. Were they married people, both of them?

A. The gentleman was a man of family. The lady was in a family but she was a young girl about sixteen.

Q. Had the gentleman been threshing along the bottoms of the Illinois river?

A. He had done some threshing along the bluffs.

Q. Do you know about what time before he was taken?

A. I judge about a month.

Q. You don't say positively that you contracted the fever from drinking the water at one of these houses; that is your opinion, that it might have been?

A. My opinion was that I contracted the disease from one or the other of these two patients.

5179 Q. You practice among the fishermen here?

A. Yes sir.

Q. And the people in general, too, do you?

A. Yes sir.

Q. And were practicing that way at that time?

A. Yes sir.

Q. You are just as likely to have taken a drink at some other place as at either one of those two houses?

A. Yes sir, those two cases were the only cases I had last summer of typhoid fever.

DR. T. O. HARDESTY.

5180 Kampsville, Illinois, July 17, 1903.

DR. FREDERICK W. RUNDE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Dr. Frederick William Runde; occupation, physician and surgeon; Kampsville, Illinois.

Q. Of what school of medicine are you an adherent?

A. The regular.

Q. How long have you been practicing medicine?

A. Why since 1898; it would be going on five years.

Q. Where have you practiced?

A. I practiced in Denver, Colorado, a year and a half and the balance of the time at this place.

Q. Have you been in Kampsville then a little over four years?

A. It will be four years on the 26th of November.

Q. Were you living at Kampsville before January, 1900, and if so, for how long?

A. Yes, I lived before that time at Kampsville, say a month and a week; say five weeks.

5181 Q. Were you familiar with the waters of the Illinois river prior to the opening of the drainage canal in 1900?

A. Well not particularly except as to the stage of the water.

Q. Have you been engaged in the general practice of medicine here?

A. Yes sir.

Q. How many cases of typhoid fever have you treated in this vicinity?

A. Two cases, one was a case of my own and the other case was in consultation with the other doctor, that was the case of Dr. Hardesty.

Q. Where was the other case that you treated?

A. About three miles south of Kampsville.

Q. How far from the Illinois river?

A. I would judge a mile and a quarter.

Q. Did the person having the fever drink the waters of the Illinois river.

A. No, not to myknowledge.

Q. What has been the condition of the health of the people of this community since the opening of the drainage canal?

A. Why it has been fairly good.

Q. As to malarial diseases, where in your experience have they most prevailed, among the people using the Illinois river water for domestic purposes or away from the river? 5182

MR. JEFFRIES: Object to the question as being entirely leading and suggestive, and assuming that the people who live upon the Illinois river and along its banks use the water of the Illinois river for domestic purposes, when the evidence thus far introduced shows that they do not use it for drinking and domestic purposes, and as being decidedly unfair.

A. As far as my knowledge, why very few drink the water, except those that probably live along the river and can't get anything else, can't get any well water or spring water. As far as the prevalence, there is just as much out in the hills as there is along the river.

Q. Do you conduct any other business?

A. Yes sir.

Q. What is it?

A. Pharmacy.

Q. What is ordinarily known as a drug store?

A. Yes sir.

Q. You may state what in the last two years has been the sale of drugs and medicines in your store which have been used by the people for curing malarial diseases?

MR. JEFFRIES: Objected to as immaterial and as incompetent for the reason that the evidence of this witness shows, as well as the evidence of other witnesses, that the water of 5183 the Illinois river is not used for domestic and drinking purposes.

A. Well I may state that the sales of patent medicines are a great deal less, and especially malarial medicines—anti-malarial, would be more proper.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. Are you a married man?

A. Yes sir.

Q. You use well or cistern water at home?

A. Use well water.

Q. You use well water in the preparation of your prescriptions.

A. Yes sir.

Q. Where did you study medicine?

A. At St. Louis.

Q. At what college?

A. Marion Simms, and also a post-graduate last fall in the medical department of Washington University.

FREDRICK WILLIAM RUNDE, M. D.

5184 Kampsville, Illinois, July 17, 1903.

ALBERT R. ZIMMERMAN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows.

Q. What is your name, residence and occupation?

A. Albert R. Zimmerman; Kampsville, Calhoun county, Illinois; ship carpenter and calker by trade.

Q. How long have you lived upon or along the Illinois river?

A. I have lived on the Illinois river practically all my life; I am 44 years old and I have been on this river 43 years. We came on the river when I was about a year old, and of course during that time I have been off a little bit, not much, a year or so.

Q. How much of the Illinois river have you been familiar with?

A. Well I will say from Twelve Mile Island to Havana; that is twelve miles from the mouth of the Illinois river; above that I haven't been very much, above Havana.

Q. What was the condition of the Illinois river before January, 1900?

A. The general condition, the stage of the water?

Q. Yes.

5185 A. Well of course the condition has been changed a good many times, but during low water the water was very low and I have noticed a great deal of green stuff and such as that floating in the river; and I can remember when I was a boy and first came on the river; I was probably five or six years old, the river had a great deal of moss; you could almost track a steamboat in it where it ran; now some people may think that is kind of funny, but nevertheless that is a fact, but I presume the high water has taken that out and we don't have any of that any more.

Q. What was the color of the water when the river was at low stage?

A. Well, sometimes it would get pretty green, very green; I have seen it here where it would be green all over, all over the top of the river, but how deep I don't know; but pulling a skiff over the river you could just see the mark of the boat right through the green stuff, moss, or whatever it was, I don't know.

Q. Did you ever notice any odor from the water? If so what kind of an odor?

A. Yes, sir, I have, I noticed it a few years ago, that it was so bad you could scarcely stand it all, up there at LaGrange locks; you take a wind blowing from the north at that lock and you could scarcely stand it at all, and we used to use it for washing purposes, and in fact we used it for drinking purposes, but in got so bad we couldn't even stand the smell of the water in

5186 the house, boiling on the stove; we had to quit it entirely, using it for washing purposes.

Q. Did you drink the waters of the Illinois river before the opening of the canal?

A. We used to drink it very nearly altogether when we was out with the fleet dredging.

Q. Do you know of any cases of typhoid fever among the people drinking the water of the river?

A. Well I never heard of a genuine case of typhoid fever right on the river bank in my life, since I have been on it; I haven't heard of any; all the typhoid fever that ever I heard of I know has been back off of the river.

Q. Since the opening of the drainage canal, what has been the condition of the Illinois river?

A. Well, I find that the river—that we have had a higher stage; we have had more current in the river and as far as speaking about the condition of the water in general whether it has been a benefit or a detriment to the water I couldn't say; I don't see so much of that green stuff in the river, that moss. We have drank the water since that drain has been in and as far as drinking, we can't tell any difference in the taste of it, and we don't find any more sediment in the water than we did before and I presume, take the water in general of the Illinois river,

5187 the Illinois river is today, I believe, is really better than it was before it went in.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say you are a carpenter and skiff builder?

A. Carpenter and caulker.

Q. Where are you at work now?

A. Kampsville.

Q. You don't know whether the water contains deleterious matter or not?

A. Well I never analyzed the water; I can't tell you.

Q. Are you a man of family?

A. Yes sir.

Q. Do you use well or cistern water at home?

A. We use well water at home.

Q. For drinking and domestic purposes?

A. Yes sir.

Q. You say that before the opening of the canal the water in the Illinois river was stagnant?

A. I didn't say it was stagnant; I said the water got very green in low water.

Q. There was no current in it?

A. Well, yes, I never see the river when there was no current in it except when the Mississippi river would back it up.

5188 Q. No current to speak of I mean.

A. Well, yes, it would get so there wasn't very much current in it of course.

Q. You are not on the river every day?

A. I am on the river every day that I am not sick.

Q. What do you do on the river?

A. I am a ship-builder and caulker by trade and I work for the government. I have been working for the government for the last eighteen years on this river. We are working on boats for this Chicago drainage now.

Q. You mean the Chicago drainage canal?

A. For the survey.

Q. Well that's the sanitary district of Chicago?

A. Well I don't know whether it is for the sanitary district or not; it is for the survey; I don't know whether it is the same thing or not.

Q. There is a fairly good current at all times of the year now, is there?

A. Yes we have had a good current in the river for the last two or three years.

ALBERT R. ZIMMERMAN.

5189 Kampsville, Ill., July 17, 1903.

C. V. BRAINARD,

recalled for further examination by Judge Johns, testified as follows:

Q. In your employment by the government, have you been in charge of the dredging operations on the Illinois river?

A. All that has been done in the last twelve years and a half.

Q. Covering how much of the Illinois river?

A. From Copperas Creek lock to the mouth.

Q. Do you accompany the dredge boats at times?

A. Yes sir.

Q. What character of material is dredged from the Illinois river?

A. There is some sand, some clay and some mud.

Q. Where is the dredging done?

A. Well, what do you mean by that?

Q. As to the bars in the Illinois river?

A. As to the location of them you mean?

Q. Yes.

A. Most of the dredging has been done between Kampsville and the mouth of the river, and also between Copperas Creek and Kampsville locks.

Q. What is the purpose of the dredging?

MR. JEFFRIES: Objected to for the same reasons as before suggested in reference to testimony of this character, made by previous witnesses. 5190

A. To deepen the channel.

Q. Is the dredging done largely where bars have formed in order to cut a channel through them?

A. Yes sir.

Q. Where do these bars form, above or below the mouths of the tributaries of the Illinois?

A. The majority of the dredging that has been done is to cut these bars that have been formed for years and have been an obstruction to navigation for probably 20 years and they exist in all points of the river, but the new bars forming are generally below the mouths of the creeks.

Q. What is done with the dredged material?

A. It is deposited to one side in the river.

Q. Do you choose localities if you can, for the depositing of the dredged material?

A. There isn't much choice; we put them in the shortest possible towage that we can get; simply throw it to one side of the river.

Q. Do the channels in the new bars that are formed, sometimes fill up?

A. The dredged channels fill up at times, yes sir.

Q. From what cause?

5191 A. Between Kampsville lock and the mouth of the river it is usually formed by the back water of the Mississippi. There are times at which the creeks pouring out a flood at certain stages of the river will fill up the channel immediately below the mouth of the creeks.

Q. What is the effect upon the sedimentation in the Illinois river of a flood?

A. My experience has been that there is no effect on what has already been deposited.

Q. Does it have the effect to increase the amount of sedimentary matter or material?

A. Well, that I couldn't say. After floods, after high waters we frequently find some of our channels filled up. That is usually in parts of the river that are affected by back water from the Mississippi. This may be caused by two reasons, either that the water that is entering the river from the Mississippi is full of sediment which is deposited when the current is slack, or it may be that the water coming from above in the Illinois river, deposits the sediment into the slack water that is formed from above in the Illinois river, by emptying into the back water of the Mississippi; the deposits may be made in either of the two ways.

5192 Q. Before the opening of the drainage canal in January, 1900, did the Illinois river scour and clean itself in times of high water?

A. I never knew of it doing it.

Q. Since the opening of the drainage canal, does the Illinois river scour and clean itself?

A. No sir, no more than it did before.

Q. Before and since the opening of the drainage canal, if sedimentary matter is deposited in the Illinois river, how is it removed?

A. The only way that it is removed is by dredging it, or some mechanical process; the river doesn't clean itself at all that I have ever been able to find out.

Q. During the high water of this past spring season, which way did the water in the Illinois river flow?

A. At this point it flowed up stream for several days.

Q. Do you know how far that flow up-stream extended?

A. I only know from talking with other parties.

MR. JEFFRIES: Well, we object.

Q. Go on and state it.

MR. JEFFRIES: Objected to as hearsay testimony.

A. I talked with Mr. Worman of the Government survey and he said that he had obtained data that indicated that 5193 the current flowed up-stream above what is known as the Griggsville Bridge, that is about 60 miles from the mouth of the river.

MR. JEFFRIES: We move to strike out the answer because it is hearsay, and the evidence of Mr. Worman can be obtained.

Q. What occasioned this reversing of the current of the Illinois river?

A. The excessive rise in the Mississippi river.

CROSS-EXAMINATION, By Mr. Jeffries.

MR. JEFFRIES: We move to strike out all the evidence of this witness taken today, for the reason that he has not qualified to testify upon the subject about which he was interrogated not having qualified as a hydraulic engineer.

Q. Mr. Brainard, how far is Copperas Creek dam from Kampsville?

A. It is about 106 miles.

Q. Records are kept of all this work, are there not?

A. Yes sir.

Q. And in those records are daily statements of the amount of deposits removed?

A. Yes sir.

Q. The character of the deposit?

A. Yes sir.

Q. And the disposition made of it?

A. Yes sir.

5194 Q. Where are those records?

A. I have a copy of them here in my office and there is a copy in Chicago, in the office of the District Engineer in Chicago.

Q. What is his name?

A. Well really I don't know who it is now; they are just about to make a change; I don't know whether they have made the change or not; Major Willard has been since January, 1900.

Q. Can those records be removed from your office?

A. I don't think they can; a copy of them probably could be obtained.

Q. How deep would the mud accumulate where you have been dredging in these various places?

A. How deep?

Q. The approximate variation?

A. Oh, it might be from a few inches to three or four feet; we finished dredging below the mouth of what is known as Otter Creek below here, one night and moved up half or three-quarters of a mile and began dredging again, and there was a big storm up Otter Creek that night and the next morning we found that there had been a deposit of over a foot in our dredged channel from that storm. Another instance was at French Bar; we dredged from that for about a mile in 1894, and in 1899 we went back to widen the channel; we found that during the high water

of 1899 that in parts of that old channel there had been
5195 from three to four feet of a deposit, and this was caused by back-water from the Mississippi.

Q. Caused by the back-water of the Mississippi river coming up the Illinois river and not having sufficient time to carry the dirt and soil coming from the Illinois river while running out?

A. Yes sir; well, I don't know whether it was caused from the sediment from the Illinois river or whether it was from a sediment out of the water of the Mississippi; that would be impossible to tell which it came from.

Q. It isn't likely that that much deposit would come from back water?

A. Well, I couldn't say that it wasn't likely.

Q. Was the sediment or deposited matter of the same depth over the whole body of the river?

A. No it wasn't, it was simply inside of the dredged channel; outside of the dredged channel it didn't show up so much.

Q. Did it extend over the whole length of the channel that was covered by the back water?

A. No, there was only portions where there were deposits; there was a deposit at French Bar and a deposit along Herriken Island above French Bar.

5196 Q. How long has it been since there has been dredging done in the river?

A. Two years ago this summer.

C. V. BRAINARD.

5197 Kampsville, Illinois, July 17, 1903.

JAMES R. FULLER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. James R. Fuller; Kampsville, Illinois, overseer Illinois river crew.

Q. As such overseer are you in the employ of the government of the United States?

A. I am.

Q. How long have you been in the employ of the government, upon the Illinois river and in what capacity?

A. Thirteen years altogether, clerk and overseer.

Q. What are the duties of overseer?

A. Well I have charge of repairs and construction work and dredging operations under the supervision of the assistant engineer when he is there; when he is not there, why the same duties that he has.

Q. Who has been assistant engineer?

A. W. M. Charles was when I first came on board; C. V. Brainard since.

Q. Over what part of the river have dredging operations
5198 been conducted since you were overseer?

A. As far as I am concerned myself I have never done any dredging above Meredosia; between Meredosia and Six Mile Island.

Q. What has been the purpose of the dredging?

MR. JEFFRIES: Objected to for the same reason as stated in reference to the testimony of the same character from other witnesses.

A. To improve navigation.

Q. Is dredging done through bars that formed in the river?

A. The bars that have principally been in the river and always were in the river, through bars only.

Q. How wide as a general rule have the channels been cut through bars?

A. Two hundred feet I think was the last project; 200 feet wide.

Q. What is done with the dredged material?

A. As far as possible it is dumped along the shore opposite the dredged channel.

Q. What is the character of the material dredged from the bottom of the Illinois river?

A. Sand and mud and some mussel shells.

Q. Where are the bars formed as a general rule, with reference to the mouths of tributaries of the river.

MR. JEFFRIES: Objected to as immaterial and incompetent from this witness.

5199 A. Generally below the mouths of these tributaries.

Q. What causes those formations?

MR. JEFFRIES: Objected to for the same reasons.

A. The flood washes it down from these tributaries; the deposits are washed down by the floods out of those tributaries.

Q. Do the channels cut in these bars ever fill up?

A. Yes sir.

Q. From what cause?

MR. JEFFRIES: Objected to for the same reasons.

A. Freshets out of these tributaries.

Q. Have you occasionally redredged the channels formerly dredged out?

A. We have.

Q. How frequently did that occur?

A. Well just now I only think of two instances.

Q. Where were they?

A. One at French Bar, and one at Six Mile Island, and one at Otter Creek; yes there is four—one at Herriken Island, too.

Q. What is the effect so far as sedimentation is concerned, of a flood in the Illinois river?

A. It would make some deposit along the banks. At the lower end if we have back-water from the Mississippi, it is liable to make deposits in the main channel. 5200

Q. Does it have the effect to lift up and remove sedimentary matter previously deposited, either in the channel or along the banks of the river?

A. I have never seen any effects of it.

Q. In the Illinois river, if sedimentary deposits are made, or occur, what is the only means of removing them?

MR. JEFFRIES: Objected to as immaterial and incompetent.

A. Dredging as a rule; in some form or other.

Q. Did the Illinois river before the opening of the drainage canal, scour or clean itself in times of flood?

MR. JEFFRIES: Objected to as leading and for the reason that the witness has not qualified as a hydraulic engineer or otherwise to know or testify on that subject.

A. Not as I ever saw.

Q. Since the opening of the drainage canal, does the Illinois river scour or clean itself?

MR. JEFFRIES: Objected to for the same reasons.

A. No sir.

Q. In either times of flood or in other stages of water?

MR. JEFFRIES: Objected to as leading.

A. No sir.

Q. Since the opening of the drainage canal, if sedimentary matter occurs in the Illinois river, what is the only means
5201 of removing it?

MR. JEFFRIES: Objected to for the same reasons as before, and for the further reason that the witness has answered it.

A. Dredging.

Q. What is the width of Copperas Creek dam, or length?

A. I do not know.

Q. Well, approximately?

A. Well, I should think it was seven or eight hundred feet, but I don't remember now; I don't know as I ever saw the length of it stated.

Q. What was the condition of the Illinois river water before January, 1900, as to current, general appearance and odor, if any?

A. The current was sluggish, especially in low water, and the river was always muddy. In low water it smelled pretty strong a good deal of the time.

Q. What has been its condition since the opening of the canal?

A. I think the water has been clearer since the opening than it ever was before and there is a good deal more current.

Q. Did the men under you that worked in the dredging operations drink the Illinois river water before the opening of the canal?

A. They did part of the time; occasionally there would
5202 be a spring near where we were working and they would drink that water; otherwise they would drink the river water.

Q. Since the opening of the drainage canal, have they drank the Illinois river water?

MR. JEFFRIES: Objected to as immaterial.

A. Part of the time about the same as they did before; when spring water was convenient they used it; when it wasn't they used river water.

Q. Has there been any typhoid fever among these men to your knowledge?

MR. JEFFRIES: Objected to for the reason that the witness is not a physician and has not qualified as being familiar with that disease or acquainted with the symptoms.

A. Not to my knowledge.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You don't mean to say that in times of high water the river does not cut through these bars and deposits and at places form new channels, do you?

A. Yes, sir, that is what I mean to say.

Q. It doesn't do that?

A. The river don't cut out channels; don't change a channel from itself; it won't cut a channel through these bars.

Q. Then the channel you say never changes, either in
5203 high or low water?

A. Not in my experience; it never changes from the river itself, the current never changes. We change the channel occasionally, dredging; I never saw this river change a channel from the effects of the water.

Q. You are not an engineer?

A. Yes sir, I have studied civil engineering.

Q. Not hydraulic engineering?

A. No sir.

Q. Did you graduate as a civil engineer?

A. No sir.

Q. How long has it been since you have done any dredging?

A. Two years.

Q. Considerable before that?

A. Yes sir, well I worked the season of 1900, 1899, 1897 and 1895, and three months in 1901.

Q. You have never examined the water, have you, in the Illinois river?

A. What do you mean, analyzed it?

Q. Analyzed it to see whether it contained any poison or not?

A. No sir, I never analyzed it.

Q. You don't know anything about it in that respect?

A. No sir.

JAMES R. FULLER.

5204 Continuation at Gravel Point, Illinois, July 17, 1903.

JOHN WEIMER,

called as a witness in behalf of the defendants having first been duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. John Weimer.

Q. Where do you live, Mr. Weimer?

A. Gravel Point.

Q. How far is that from the mouth of the Illinois river?

A. About forty miles.

Q. How long have you lived here?

A. Three months.

Q. What was your business before coming to Gravel Point?

A. I was employed by the government.

Q. In what capacity?

A. As dredge engineer.

Q. How long were you in the employ of the United States government?

A. In the neighborhood of about sixteen years all told.

Q. On what rivers?

A. On the Mississippi and Illinois.

5205 Q. Are you familiar with the Illinois river?

A. Yes sir, to a certain extent I am.

Q. What extent?

A. Well, I think I know the nature of the river pretty well.

Q. Are you familiar with the character of the soil through which the river runs?

A. I am to a big extent.

Q. Do you know how many dams are on the Illinois river?

A. Yes sir.

Q. How many dams are there?

A. Four.

Q. How far up the river are you acquainted?

A. I am acquainted as far as La Salle.

Q. How far down the river are you acquainted?

A. To the mouth of the Illinois.

Q. At what points along the river have you done dredging?

A. Well I have dredged along the river from three miles above Hennepin down to the mouth.

Q. Hennepin is where the Hennepin canal enters the Illinois river is it not?

A. No it is two miles below; Hennepin is below the mouth of the canal.

Q. You are familiar with the character of the Mississippi river are you not?

5206 A. Yes sir, to a big extent.

Q. From what points?

A. From Winona to about twenty miles below St. Louis, I am acquainted to a big extent with the Mississippi river.

Q. How does the Mississippi river and the Illinois river compare as to their channels?

MR. JEFFRIES: Objected to.

A. They don't compare at all, the two rivers.

Why, one will stay stationary in its place and the other moves.

Q. Which one moves?

A. The Mississippi.

Q. And the Illinois stays stationary?

A. Yes sir.

Q. Is it the Mississippi river that scours?

A. Yes sir.

Q. How about the Illinois?

MR. JEFFRIES: Objected to because the witness has not qualified as a hydraulic engineer or qualified upon that subject.

A. In regard to the channel?

Q. Does it scour?

A. No sir.

5207 Q. When sedimentary substances are deposited on the bed of the Illinois river, what effect does high water have upon the beds of the streams and the deposits made upon the bed of the stream of the Illinois river?

MR. JEFFRIES: Objected to for the same reasons as stated in the previous question.

A. That is in reference to the bed of the river?

Q. Yes.

A. I don't see that it has any whatever.

Q. Will high water in the Illinois river scour out the bed of the river?

MR. JEFFRIES: Objected to as leading and suggestive of the answer desired, and for the reason that the witness has not sufficiently qualified himself to testify especially as to the strength and power of the water at the various stages of the river, according to the gauge and flow of the river.

A. No.

Q. Have you had any experience with the Illinois river that justifies you in making that statement?

A. Yes sir.

Q. Relate your experience in that regard?

A. I have sounded the gauge of the water when we dredged, and have sounded it a year or two after we dredged, and found about the same water.

5208 Q. What effect have freshets in the tributaries to the Illinois, upon the Illinois river?

MR. JEFFRIES: Objected to as immaterial and as not a competent question to ask of this witness.

A. They have quite an effect on the Illinois river.

Q. In what way?

A. In washing the soil off the hills and carrying it into the river.

Q. Where is this soil deposited in the river?

A. Principally at the mouth where it strikes a big body of water where it loses the swiftness of the current.

Q. Will that deposit so made by freshets subsequently be removed by high water?

MR. JEFFRIES: Objected to as leading and suggestive and as incompetent of this witness.

A. It might in some cases, but most of the cases it don't on the river.

Q. What cases will it?

MR. JEFFRIES: Objected to for the same reason.

A. It might in a case where the river is very close and a creek comes out into the river, while if there is a big stage a big flat bed, it won't.

5209 Q. In cases where it is removed from the mouth of the tributaries because of the narrowness of the river, what becomes of the deposits so removed?

A. Why I am not able to answer that question for the simple reason that in all the rivers, we have not such experience where it did remove it, but I just said it might remove it where very shallow; it might remove it of its own accord where it is very shallow, but in the twelve years while I was here, we had none of that experience, but yet such might be the case.

Q. How are those bars removed when they are removed?

A. In this river?

Q. Yes?

A. By dredging, we remove them by dredging.

Q. Have you had any experience during the last twelve years upon this river, of instances where you have dredged out a channel and that channel susequently filling up?

A. Yes sir, I have.

Q. Give the instances?

A. We were down here dredging at Twelve Mile Island, right below Macoupin, and we were just about through and we were going to move up the river with the fleet, and a rain came that night up the Macoupin and it come down the Macoupin creek an awful strong current, and it regular flooded; it filled up the channel about a foot.

5210 Q. Any other instance that you can recall?

A. I couldn't think right at this moment.

Q. Do you know when the dams on the Illinois river were built?

A. I know when part of them were built.

Q. Which ones?

A. Why the two lower ones.

Q. What are the names?

A. Kampsville and LaGrange.

Q. Has the river filled up above those dams since they were built, by deposits?

A. Has the river filled up above the dams?

Q. Yes, by sediment outside of the channel which is kept?

A. I don't believe that it has as far as I know of; it might right above the locks; I don't know that it does, but it might be.

MR. JEFFRIES: We object to the statement of the witness as to what it might be.

Q. When matter is deposited on the bed of the Illinois river, do you know of any way by which that deposit can be removed except by dredging?

MR. JEFFRIES: Objected to as leading and suggestive and not a proper question of this witness, the witness not being qualified to express an opinion on that subject.

A. No sir.

Q. Does high water or current change the channel in the Illinois river?

5211 MR. JEFFRIES: Objected to as incompetent of this witness, as calling for an opinion without the witness first having qualified as being capable of forming an opinion or expressing a judgment that would serve any lawful or reasoable purpose.

A. No sir.

Q. What effect does current and volume of water have upon the channel of the Mississippi, if you know?

A. Well, I have seen where the channel would be one time, and after high water it would be altogether removed from there and be another place.

Q. That condition is common on the Mississippi, is it not?

MR. JEFFRIES: Objected to as leading and suggestive.

A. Yes sir.

Q. Have you ever found that condition to exist upon the Illinois?

A. No sir.

Q. What was the character of the water of the Illinois river before the drainage canal was opened?

A. In low water when we didn't have no rains for quite a while it was very stagnated, fearful.

Q. What was its color?

A. It was greenish.

Q. What has been the condition of the Illinois river since the opening of the drainage canal?

5212 A. I consider that it has been a lots better water since we got more current in the river; very better.

Q. In what way is it better now than it was before?

A. I consider it purer now than it was before.

Q. Has it an odor as it had before?

A. At the present?

Q. Yes?

A. No sir.

Q. How many fishermen are engaged in the fishing business at this point?

A. Six or seven families.

Q. Do they live on the river?

A. Along the shore principally.

Q. Do you know of any typhoid fever being among those people?

A. No sir.

MR. JEFFRIES: Objected to as the witness is not a physician and has not qualified as being acquainted with that disease.

Q. Have you drank the water of the Illinois river before and since the opening of the drainage canal?

A. Yes sir; I have used it nearly altogether for twelve years both in summer and winter.

Q. How does it compare for drinking purposes now with what it did before the opening of the canal?

A. It is lots better now.

5213

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You say you live here at Gravel Point?

A. Yes sir.

Q. How long have you lived here?

A. About three months.

Q. Where did you live before you came here?

A. Kampsville.

Q. Did you live in a house-boat there?

A. No sir.

Q. Do you here?

A. No sir.

Q. Did you have a cistern or well down there at Kampsville?

A. We had at the house either a well or a cistern, but I stayed on the river continually more or less.

Q. You are a married man?

A. Yes sir.

Q. Have you a well or a cistern at this place where you live now and have lived for the last three months?

A. I have a well here.

Q. You use the water of the well for domestic and drinking purposes?

A. Yes sir.

5214 Q. Now when was it you said, that you commenced working for the government in dredging business?

A. In the dredging business?

Q. Yes.

A. About fourteen or fifteen years ago, dredging, and I worked before for them, before dredging.

Q. When did you quit?

A. I quit about three months ago.

Q. Where were you dredging when you quit?

A. We were laid up at the time that I quit. We were repairing then.

Q. How long had you been laid up?

A. Last June a year ago or two years ago.

Q. About two years and a half ago, wasn't it?

A. I don't know exactly whether it is two years ago or last June a year ago.

Q. Who were you working under, Mr. Brainard?

A. No, I was under Mr. Long.

Q. You haven't been on the river much since that time excpt around here fishing?

A. Well not in the line of dredging, but I have been on the river more or less; in fact I have been continually on the river.

Q. There is quite a current in the river now?

A. Ordinary current.

5215 Q. What do you mean by an ordinary current?

A. Well, we have had stiffer currents than this already and we have had less current.

Q. How much less?

A. I have seen the current run up stream; you might take the difference.

Q. That was before the canal was opened?

A. No that was this spring.

Q. That was the back water from the Mississippi?

A. Yes sir.

Q. That is the only reason that the water ran up stream?

A. Yes, that's the only reason.

Q. Where did you do your dredging on the Illinois river?

A. I done it along the Illinois river from above Hennepin down to the mouth.

Q. Principally from here to the mouth?

A. Principally from here to the mouth.

Q. How deep a channel would you dig or dredge?

A. That depends on the stage of the water we had in the river. You mean how deep below low water?

Q. Yes, I want to know how much earth you would remove out of the bottom of soil and mud and filth?

A. That depends altogether on the depth we are going
5216 there.

Q. Well, from one to three feet?

A. Well generally a certain depth below low water, whatever it is, sometimes two feet, three feet or four feet.

Q. What was the character of the material taken from the bed of the stream?

A. Very heavy loam and in places in those creeks and stuff, we would get heavy gravel and mussel shells.

Q. And mud?

A. Necessarily heavy mud in it.

Q. Where was the last place that you dredged?

A. I ain't positive whether it was Hennepin or Kampsville; I ain't positive about that, but I know I worked there:

Q. What was the character of the material that you took out at those places, mud?

A. Yes, principally mud.

Q. Now immediately before that where did you do some dredging?

A. Well now, that's pretty hard to tell; if I had my books here; otherwise I couldn't tell off-handed; We dredged so much here and we would move forty or fifty miles and then dredge there, and it is pretty hard to tell in what direction we did go then, but I think it is principally below Kampsville locks; I think that was the principal dredging that we have been doing lately.

5217 Q. There hasn't been as much dredging in the last three years as there was the three years preceding?

A. No sir.

Q. In fact comparatively speaking there has been very little?

A. Very little in the last couple of years.

Q. Now you made a report of all this dredging, didn't you?

A. Yes sir, I kept a record of it.

Q. Did you keep a record of the amount of filth and mud that you took from the bottom of the river?

A. Yes sir.

Q. What did you do with it?

A. The government has got it on file.

Q. Where?

A. My report is kept there at Kampsville.

Q. You made that report daily?

A. Yes sir.

Q. And set down the number of hours worked?

A. Yes sir.

Q. The amount of substance removed?

A. Yes sir.

Q. The character of the substance?

A. Yes sir.

Q. An the disposition that was made of it?

A. Yes sir.

5218 Q. And the depth of the mud where it was taken from?

A. No sir, we took that before we started in with the dredge.

Q. When you took that depth before you commenced to dredge, what did you do with it, make a report?

A. Yes sir.

Q. And is that report at Kampsville?

A. That report is on record either at Kampsville or at Chicago.

Q. When you say that the water is better now than it was before the canal was opened you mean just from its appearance or your observation of it and not from any examination which you made of the water?

A. Well I made my observations by using it.

Q. For drinking purposes?

A. Yes sir, I find it is better now than it was before.

Q. While working on the river?

A. Yes sir.

Q. You are fishing now are you?

A. No sir.

Q. What are you doing?

A. I am doing a little of everything and not much of anything.

5219

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Just state in detail what you are doing?

A. Well sir, I am running a store here; I farm, agricultural implements, blacksmith shop, and I will sell most anything a man wants, and buy most anything a man has.

JOHN WEIMER.

5220 Gravel Point, Illinois, July 17, 1903.

THOMAS J. NELSON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd, and testified as follows:

Q. What is your name?

A. Thomas J. Nelson.

Q. What is your business?

A. Well I have been fishing for a few years and am fishing now.

Q. How long have you been a fisherman?

A. I have been a fisherman for about six years.

Q. What did you do before that time?

A. I farmed here along the river bottoms between here and Kampsville.

Q. During the last six years that you have been a fisherman, have you observed the Illinois river and the waters of the river?

A. Yes sir, noticed it pretty nigh daily.

Q. Before the opening of the drainage canal what was the condition of the water?

A. Well in the fall of the year it was in rather a bad condition; there was a smell to it; it was no current, and green
5221 moss and grass grew in it, a heap more so—there hasn't been any since—to say any, since, and before it was no current.

Q. Was there an odor to the water before the opening of the canal?

A. Well I couldn't say that there was; I didn't use any of it; it was impure, was all you could call it.

Q. What effect has the opening of the drainage canal had upon the waters of the Illinois river?

A. Well it give it a current and the water has become purer, there is more current in it, is all the difference that I can see.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. The only difference then that you can see between the waters of the Illinois river now and prior to the opening of the Chicago drainage canal is that there is a larger volume of water and a better current?

A. Yes sir, there is more water in the river and more current, and it is purer; the current makes it purer so it can run off, is the only difference that I can see in it.

Q. How old are you?

A. I am 63 years old, was the 8th day of last May; was born in 1839.

5222 Q. Have you always lived on the river?

A. I have been on the river here since the fall of 1859, except one year I was in Arkansas; I have been here ever since. I came here thirty days before Abe Lincoln was elected president; wasn't here long enough to vote except for President.

Q. Did you vote for president?

A. In that year?

Q. Yes.

A. No sir; I didn't go to the polls at all, I cut my foot the night before and didn't go.

Q. You say you have been farming on the river for the last fifty years?

A. Yes sir.

Q. You live in a residence here?

A. I live in the first house below here, just a half or a quarter,—the first house below.

Q. Have you a cistern or a well?

A. I have a well.

Q. You use the water from that for drinking or domestic purposes?

A. Yes sir.

Q. So far as the question as to whether or not the water 5223 in the Illinois river contains more deleterious matter now than it did prior to the opening of the canal, you have no information have you?

A. No, I haven't.

Q. You don't know whether the sewage from Chicago gets down here this far or not?

A. No, I couldn't say; of course the water must come here; that is all I could say. It has got to go down stream some place, but this year it went up-stream here.

Q. That was caused by back water from the Mississippi?

A. Yes sir.

Q. And the Mississippi was higher than it has been since 1844?

A. Well, I couldn't say; I know that it is the second time

I have seen the water run up-stream this far since I have been here.

THOMAS J. NELSON.

5224 Gravel Point, Illinois, July 17, 1903.

THOMAS CARTER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Thomas Carter.

Q. Where do you live Mr. Carter?

A. Why I live right down here at Gravel Point.

Q. What is your business?

A. Fishing.

Q. How long have you been a fisherman?

A. I have been fishing for the last forty-five years.

Q. Are you acquainted with the Illinois river before the opening of the drainage canal?

A. Yes sir.

Q. What was the condition of the water of the Illinois river before the canal was opened?

A. Well the late years it was stagnated; low current.

Q. Any green scum on it?

A. Yes sir.

Q. Any smell?

A. Yes sir, in the hot part of the season, July and August.

5225 Q. What effect has the opening of the drainage canal had on the waters of the Illinois at this point?

A. What effect it has?

Q. Yes?

A. Well it has put some current in it; it keeps that green scum off so far.

Q. What else?

A. Why I think the water it purer than it was.

Q. Did you ever drink the water from the Illinois river?

A. Yes sir.

Q. Have you drank it since the opening of the canal?

A. Yes sir.

Q. How often?

A. Well I never drank it much in the summer time; in the winter I do.

Q. How many men are engaged in the fishing business at this point?

A. How many?

Q. Yes?

A. About five.

Q. Any typhoid fever among them?

A. Not as know of; I never heard of any.

5226 CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How long have you lived here?

A. I have been living here about 25 or 30 years.

Q. Been fishing all the time?

A. Yes sir.

Q. Do you live in a boat on the river or in a house?

A. No, I live in a house.

Q. Have you a well or a cistern?

A. I have a well.

Q. You use the water out of that for household and drinking purposes?

A. Yes sir.

Q. When you say the water is better now than it was before the opening of the Chicago drainage canal you mean it has a better current and a larger volume of water?

A. Yes sir.

Q. You don't know whether the water contains more deleterious matter now than it did before the opening of the canal or not, do you?

A. No, I couldn't say.

Q. It is not used much for drinking purposes?

A. No, not very much.

Q. Only when you get out on the river and want a drink
5227 and haven't got anything else?

A. Yes sir.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Do you mean there is a swifter current and a larger volume of the same kind of water that was here before the canal was opened?

A. Yes sir.

Q. No difference in the quality of the water?

MR. JEFFRIES: I object to that as leading.

A. No, I don't know as there is any difference in the color.

Q. Was the water before the canal was opened, as clear as it is now?

MR. JEFFRIES: I object to the question as leading.

A. Except the scum.

Q. What did you mean when you said that the water was better now, than it was before the opening of the canal?

MR. JEFFRIES: Objected to as cross-examining defendant's own witness.

A. I don't know as I said it was any better. I said there was a better current than there was; I don't know as I said the water was any better.

Q. Did you drink the water before the opening of the drainage canal?

5228 A. I have, yes sir.

Q. Have you drank it since?

A. Yes sir.

Q. Which is the better water, the water before the canal was opened, when it was stagnant, or the water now?

A. Well I don't know as I can tell any difference in the taste of it.

Q. It is all damp?

A. Yes sir.

Q. You haven't a very good taste for water anyway, have you?

A. Sometimes yes sir, when I am dry.

his
THOMAS X CARTER.
mark.
F. S. B., Com'r.

5229 Gravel Point, Ill., July 17, 1903.

GEORGE NELSON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd, and testified as follows:

Q. What is your name?

A. George Nelson.

Q. Are you the son of Mr. Nelson that testified here before?

A. Yes sir, I guess I am.

Q. What is your business?

A. I am a fisherman.

Q. How long have you been a fisherman?

A. I have been fishing for about seven years I guess; six years I think.

Q. You fished here three years before the drainage canal was opened and three years since?

A. Yes sir.

Q. What was the condition of the water of the Illinois river before the opening of the drainage canal?

A. Well it would be—I haven't seen any difference only in the fall of the year.

Q. What difference was that?

5230 A. We have a current now the last three years and water does not get so green and isn't so filthy.

Q. Did you ever drink the water?

A. Yes sir, I have drank it.

Q. Before the opening of the drainage canal?

A. I have drank it both before and since the canal.

Q. What effect has the opening of the drainage canal had on the quality of the water?

A. Well I supose the quality would be the color and such as that wouldn't it?

Q. Yes?

A. A better color and purer water is my estimation of it.

Q. Do you see any green scum upon it now?

MR. JEFFRIES: Objected to as leading.

A. No sir.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Do you live with your father?

A. Yes sir, he lives with me.

Q. He lives with you?

A. Yes sir.

Q. Your family use the water from the well there at home for drinking and household use?

A. Yes sir, we use well water.

5231 Q. You never use the water of the Illinois river except when you are out fishing and haven't got any other drinking water?

A. Yes sir, when I am around home I always drink out of the well but lots of times I am caught out when I have to drink river water you know.

Q. About the only diffrenece as I understand it between the water in the Illinois river now and what it was before the Chicago drainage canal came into it is that there is a larger volume of water, and a better current than there was before?

MR. TODD: I object to the question on the ground that counsel hasn't shown the proper qualifications to testify in this case and besides this question is not proper in form.

A. Well, there is a good deal of difference in the water.

Q. That is the main difference though?

A. Before this water came in it was a regular lake; the water was green.

Q. That's what I meant, exactly, that after the opening of the drainage canal there is a good current?

A. Yes sir, there is a reasonably fair current here ever since it was turned in.

Q. That is about the only difference, isn't it, between the water now and then?

A. Yes sir, that is the main difference.

5232 Q. You don't know whether the Chicago sewage gets down this far or not?

A. No sir, I don't.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Is the only difference that you see in the water that of the volume of the water and the speed of it; aren't there other differences?

A. Why as I stated before, the water was more clear; it wasn't so stagnant for instance; more pure. Of course the current was pure water.

Q. You mean since the opening of the canal?

A. Yes sir.

Q. And before that it was stagnant?

A. Yes sir.

GEORGE NELSON.

5233 Gravel Point, Ill., July 17, 1903.

S. D. THURSTON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. S. D. Thurston.

Q. Where do you live Mr. Thurston?

A. Calhoun county.

Q. What is your business?

A. Fisherman.

Q. How long have you been a fisherman?

A. Three years steady.

Q. Before that time what did you do?

A. Farmed.

Q. Were you acquainted with the condition of the Illinois river before the opening of the drainage canal?

A. Fairly well, yes sir.

Q. How extensively?

A. Well I have lived along the river most of my life; near it; within two or three miles.

Q. Describe the character of the water of the Illinois river before the opening of the drainage canal?

A. Well it was stagnant in low water; since the dam and 5234 locks were put in, generally none the best before.

Q. Was there any scum on the water?

A. Yes sir, at times.

Q. What kind of scum?

A. Green.

Q. Any odor to the water?

A. Yes sir, in hot weather. Water or mud settling, something, I don't know what, along in the river.

Q. Since the opening of the drainage canal what has been the effect upon the quality of the water in the Illinois river at this point?

A. Why, there is a better current and clearer water, in the winter season anyway. I would say better, in fact.

Q. Do you see any scum on it?

A. No sir, not this low down; I saw it over at Peoria.

Q. Do you drink the water when you are out fishing?

A. I do when it is cold yes sir.

Q. Has there been any sickness among the fishermen in this locality?

A. Not that I know of.

Q. Has there been any cases of typhoid fever here?

A. Not that I know of.

5235
CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You say you have been fishing three years?

A. Yes sir.

Q. Then you were not on the river constantly before the opening of the canal?

A. No sir, not constantly.

Q. And were on it only when you would have occasion to go fishing or go across it?

A. Yes sir, I have lived close to the river though.

Q. Where do you live now?

A. In Calhoun County.

Q. With reference to the river?

A. On the bank of the river.

Q. In a dwelling house or on a boat?

A. Dwelling house.

Q. Do you have a well or a cistern?

A. Well.

Q. You use the water from the well for household and drinking purposes do you?

A. Yes sir.

Q. You don't know whether the sewage gets down here from Chicago or not, do you?

A. No, I couldn't answer that question.

5236 Q. The current is very much stronger now than it was, isn't it?

A. Yes sir, there is more current than there was during low water. There was always current before the dam was put in and since, none.

Q. Until the canal was opened?

A. Yes sir.

Q. You don't drink the water unless you get caught out and have to drink it?

A. Oh, no. S. D. THURSTON.

5237 Continuation at Pearl, Illinois, July 17, 1903.

MARION HESS,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. State your name, residence and occupation?

A. Marion Hess; I live here in Pearl; I fish, farm some along the river.

Q. How long have you fished in the Illinois river?

A. I have fished off and on now for ten or twelve years.

Q. For what distance up and down the river from Pearl have you fished?

A. Fifteen miles anyhow, each way up and down.

Q. What was the condition of the waters of the Illinois river prior to January, 1900, when the drainage canal was opened?

A. Well sir, it was pretty filthy and dead.

Q. What kind of stuff or material was in the water?

A. Well sir, during along July and August it was pretty filthy, green looking water, filthy scum on the water.

Q. How did it affect your nets?

A. Well sir, it would form a scum and slime all over the
5238 nets and as you raised them up the slime and scum dropped off and some stuck on of course; some stuck on and some dropped off.

Q. Did you drink the waters during this time when there was slime and scum in it?

A. No sir, you couldn't drink it; it was too filthy.

Q. Were there times in the fall and spring when there was not slime and scum?

MR. JEFFRIES: Objected to as leading.

A. If there was, it was early in the spring; always formed a scum along in July and August and September, the best I remember now.

Q. When there was not slime and scum upon the waters, did you drink the waters of the Illinois river when fishing?

A. Well yes sir; we drank it along in the spring of the year; it was ordinarily pure then it seemed like; we had high water you see then, and made it a little more purified than along in the summer and fall.

Q. Since January, 1900, what has been the condition of the river?

A. Why it's been, it seems like purer and all right—a good current and seems like the water has been purer and all right.

Q. Since the opening of the drainage canal do you drink the waters of the Illinois river during the season?

MR. JEFFRIES: Objected to as leading.

5239 A. Yes sir, whenever I want a drink of water, during along in the season I take the cup and get me a drink most any time; when I can get no other water you see, it does pretty well.

Q. Do you know of any typhoid fever among the fishermen since the opening of the drainage canal?

A. No sir, I don't know exactly as I do; I couldn't mention any around here.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You live here in Pearl?

A. Yes sir. Live inside the corporation.

Q. On the river?

A. Yes sir, about a quarter.

Q. Do you have a well or a cistern at your home?

A. Have a well.

Q. You use the water from the well for domestic and drinking purposes?

A. Yes sir.

Q. You are a very busy man aren't you?

A. Yes sir I am a working man and work all the time.

Q. You don't pay any particular attention to the sickness in the community?

A. I ain't around so awful much; I am just mentioning 5240 about the neighborhood where I live; around town and around where I live at.

Q. You say you drink the water from the river?

A. Yes sir whenever I am out now I drink the water.

Q. When you can't get any other water?

A. When we haven't any other we do most of the time. When we can't get any we use it, but there was a time along in July and August you couldn't drink the water with scum over it at all; I remember all about them times, and now we take the bailing cup and dip it down and don't get no scum and stuff, and it seems to do for thirst; that is all I can answer for; is all I know anything about the matter.

Q. What is the difference between the current of the river now as far up and down the river as far as you know it?

A. Well, sir we have a current now all the time and in July and August in dead water we had no current at all.

Q. When?

A. Before the canal was turned in.

Q. Is it now?

A. No dead water now at all; I haven't seen any dead water since the canal was opened.

Q. What is the stage of the river now?

A. Well sir, I don't exactly know; I haven't been out. It is ordinarily low water now.

5241 Q. You have a good current in the river now?

A. Yes sir.

Q. There may have been cases of typhoid fever and you not have heard about it

A. Yes sir, there may have been because I don't inquire very much. There hasn't been none lately that I know of. Of course there has been more or less all the time, as far as that goes. But then I don't know what the cause of it is, as far as I know.

MARION HESS.

5242 Pearl, Illinois, July 17, 1903.

E. H. CHANDLER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. E. H. Chandler; my occupation is agent of the Chicago & Alton Railway and United States Express Company.

Q. And your residence?

A. Pearl, Illinois.

Q. Were you engaged to take samples of water at this point from the Illinois river in behalf of the state of Illinois and if so by whom?

A. Yes sir, by Mr. J. H. Long.

Q. When did you make an arrangement with him with reference to it?

A. My recollection of it is; I never kept any record of it in writing, was in the fall of 1899 and 1900, the first arrangement was made in the fall of 1899 as I remember it.

Q. Did you personally take the samples?

A. No sir, I had a boy staying with me by the name of Joseph Lindsey, staying in the office with me, and he took it;
he took the samples all the time; that was the understand-
5243 ing, that I couldn't get away from my office to go and
take the samples personally and he took them in my
name.

Q. How old was Lindsey?

A. He was about 21 years old.

Q. Where is he now?

A. He is in the Philippine Islands.

Q. A soldier of the United States?

A. He is in the Signal Service of the United States, yes sir.

Q. For how long a time in the fall of 1899 did you take samples, or have them taken?

A. Well according to my recollection for about in the neighborhood of two months and a half.

Q. Commencing about what time and ending about what time?

A. Well I don't really remember that it seems to me it was about along in July or August, but I don't remember about that.

Q. Did you see Lindsey take any of the samples?

A. No sir, I never was there and saw him at all.

Q. Did you have any other person taking samples for you?

A. Jonny Rader took samples—several samples after Lindsey quit.

Q. When did Rader take the samples?

5244 A. Rader took the samples after Lindsey, left; he took about six weeks; that is he took the samples six or seven times I think after Lindsey left.

Q. In what year did Rader take the samples?

A. I think in 1900.

Q. How frequently were samples taken?

A. Once a week.

Q. On what day in the week?

A. I think it was on Tuesday or Wednesday; I am not certain which.

Q. Now did you receive instructions from Mr. Long as to the manner of taking these samples and if so, you may state whether the instructions were printed?

A. As I remember it the first time they was not; it was verbal; he came to the depot up there where I was at, and after the first time it was written in a letter.

Q. What were the verbal instructions of Mr. Long?

A. The verbal instructions was to get one of those jars or jugs, whatever it was, or jar or bottle, once a week and the instructions was to get it out near the middle of the river, where the water wasn't adulterated by creeks, and to keep it cool and ship it by express, and notice the thermometer and take the temperature of the water at the time it was taken.

Q. Did you receive instructions from Long to take the temperature of the water and the temperature of the air and the direction of the wind?

5245 A. I don't remember as to the wind, but the temperature of the air and the water, yes sir.

Q. Did you receive instructions from him as to the manner in which the bottles were to be handled and treated?

A. Yes sir, they were to be packed with excelsior shavings, and that was what was in the boxes, and around the jars with ice on them and sealed up, and shipped by express.

Q. How many samples of water did you take each time that you took any?

A. One; we just took one sample at a time.

Q. How many bottles did you have each time you took a sample?

A. One, one to be shipped, sometimes we would have two or three bottles on hand at a time for future use.

Q. Did you have a large bottle and a small bottle?

A. I think there were, yes sir.

Q. Then you had two?

A. The two I think included the one shipment, the way I remember it, while I didn't handle it.

Q. Was one bottle of about a gallon capacity and the other one of about four ounces?

A. I think it was; that is the way I remember it; yes I think it was.

5246 Q. Did you instruct Lindsey how to take the samples?

A. Yes sir, and I think Professor Long also instructed him how to take them.

Q. Do you know whether Professor Long went out upon the river with Lindsey and showed him how to take the samples?

A. I think he did; they went to the river.

Q. Do you know Mr. Jacob Harman who is present here?

A. I think I have met Mr. Harman, I am not positive of it.

Q. Was Mr. Harman with Prof. Long at the time that you were engaged to collect the samples?

A. I have really forgotten, but I think there was a gentleman with him. I think it was, but I wouldn't be quite sure about it.

Q. I hand you now sixteen tickets and a piece of yellow paper and ask you first whether you are acquainted with the handwriting of Lindsey?

A. I believe I would know his handwriting yet; he was with me a year or the matter of that.

Q. When the samples of water were shipped were tickets put upon them?

A. There were tags; the tickets were put into an envelope. They were sent in an envelope.

5247 Q. Examine the sixteen tickets and the piece of paper and state whether the writing on those tickets is in Lindsey's hand?

A. Yes sir, Lindsey wrote them all, every one of them.

Q. I hand you now thirteen other tickets and ask you to state whether those tickets are in the handwriting of Lindsey—fourteen tickets?

A. I think every one of them is in his handwriting.

JUDGE JOHNS: I now hand to the Commissioner the tickets above mentioned, placed in an envelope, and ask him to mark the envelope Exhibit No. 5 for the State of Illinois, to the testimony of the witness E. H. Chandler.

Received and so marked by the Commissioner.

Q. I hand you two tickets, one dated July 21, 1899, and the other September 7, 1899; the first having the number 44 and the second No. 157, and ask you to state if you know in whose handwriting they are?

A. No, I wouldn't say.

Q. I hand you now an envelope addressed in printing to John H. Long, and having written on it at the bottom "from Geo. A. Wiggins, M. D., Milan, Ill.," and on which are also the letters "J. H. L." in lead pencil, and ask you to state whether or not the tickets which have been exhibited, and were used in the marking of the samples of water taken at this point, were enclosed in an envelope similar to that one?

A. Yes sir, I think so, if I remember and tied onto one of
5248 the bottles.

Q. Where did Lindsey take his samples of water?

A. Near the center and below the bridge.

Q. Were the samples taken by Lindsey and afterwards by Rader, taken under your supervision and direction?

A. Yes sir.

Q. After they were taken were those samples packed as directed on the back of the ticket?

A. I think they were; we got ice at the river, every time he would go down there; he would take a chunk of ice at the river and seal them up and bring them up to the depot and take them into the freight room and pack them up again; that is he would take and have some ice along and hammer it up and pack them up good with ice and then seal it up.

Q. How were they forwarded to Chicago?

A. They were forwarded by express, by the United States Express Company.

Q. From the time the water was placed in the bottles in the river, how long a time elapsed until they were sealed, packed and boxed ready for shipment?

A. Well it would be probably 30 minutes.

Q. While in Pearl with whom did Lindsey live or board?

A. He boarded with Mr. John Rader, right close to the
5249 depot.

Q. Is John Rader the same person who afterwards took the samples?

A. Yes sir.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. What business are you in?

A. I am express agent for the United States Express Company and agent for the Chicago & Alton Railway.

Q. Lindsey was there in the office with you?

A. Yes sir.

Q. Working under you?

A. He was learning; he was a student.

Q. You say you didn't personally see him take any of the samples?

A. No sir.

Q. Nor personally see any of the samples taken at any time?

A. Not any one.

Q. Where were the bottles kept, you said you had several on hand?

A. We had sometimes three on hand; kept them there in the office.

E. H. CHANDLER.

5250 Pearl, Illinois, July 17, 1903.

J. RADER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. J. Rader; I am a barber, and live at Pearl, Pike county, Illinois.

Q. Did you know a person named Joseph Lindsey?

A. Yes sir.

Q. Who lived in Pearl?

A. He boarded there about a year; he boarded with me; he was learning telegraph operating from Mr. Chandler.

Q. Did he take samples of water for the State of Illinois in 1899 and 1900?

A. Yes sir.

Q. Were you ever with him when he took samples?

A. No sir.

Q. Did you ever take any samples in his stead when it was his business to take them?

A. Yes sir.

Q. How many do you remember to have taken where it was Lindsey's business to take them?

A. Well it was two or three; I wouldn't be sure which;
5251 he was sick with the measles and I took them while he was sick.

Q. I hand you two tickets, one dated July 21, 1899, and numbered 44, and another dated September 7, 1899, and numbered 157, and ask you to state whether those two tickets are in your handwriting?

A. Yes sir, I wrote that.

Q. Now upon those two days, did you take the samples of water?

A. Yes sir.

Q. I hand you now six tickets, and ask you to state whether or not those six tickets are in your handwriting?

A. Yes sir.

Q. Did you take the samples of water upon the days mentioned on those tickets?

A. Yes sir.

Q. Describe your method of taking the samples and preparing them for shipment?

A. Well sir, I came down here and got a boat, went out to the center of the river; took the two bottles with me, the large one and the small one; took the small one out, and first took my thermometer and took the temperature of the air first, and then the temperature of the water as I was directed to by Mr. Chandler, and then I filled my large bottle, put the top on it and tied the cloth over it and put the rubber around it 5252 and the small one the same way; put the small one in the little bucket, packed it with excelsior and ice.

Q. Did you put the small bottle in a tin can?

A. Little tin can, bucket like.

Q. And did you put that small tin can in a larger one?

A. Yes sir.

Q. And packed the small one with ice inside the larger one?

A. Yes sir. And then I took the large bottle and put it in a box and packed it around with excelsior.

Q. Did you then ship this box so packed, or take this box so packed to the express office and have it shipped?

A. Yes sir.

Q. Did you tie around the neck of the bottle an envelope?

A. Yes sir.

Q. What did you place in the envelopes?

A. The report cards.

Q. Of the kind I have heretofore shown you?

A. Yes sir.

Q. I hand you now an envelope upon which is written at the bottom: "Geo. J. Wiggins, M. D., Milan, Ill.," and on which is written in lead pencil "J. H. L." and ask you to state whether or not that envelope is similar to the ones which you used?

A. Yes sir.

5253 Q. After the packages were—after the bottles were filled and sealed, how long a time elapsed until they were boxed and ready to be shipped?

A. I boxed them there at the river and carried them up home in the buggy and shipped them right away, about an hour from the time I took the water and put them on the train.

JUDGE JOHNS: I now hand the Commissioner eight tickets, and request him to put them in an envelope and mark them State of Illinois Exhibit No. 6, to the testimony of John Rader.

Said documents are so marked by the Commissioner.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. What place in the river did you take these samples?

A. Right here south of here.

Q. This side of the bridge?

A. This side of the bridge.

Q. Out in the channel?

A. Yes sir.

Q. How deep in the channel?

A. As deep down as I could reach with my arm, about sixteen inches.

Q. When did you take the stopper out of the bottle?

A. Not until I went to fill it.

5254 Q. Before or after you submerged the bottle in the water?

A. Just before I put it down into the water; just as I was reaching it over the boat, take the stopper out and let the bottle run full of water and take the bottle up, and then stop it up as quick as I could get to it.

Q. Did you rinse the bottle out?

A. No sir.

Q. Did you take a sample of that water every day?

A. Not every day.

Q. Every week?

A. Every week.

Q. Once a week?

A. Yes sir.

JOHN RADER.

5255 Pearl, Illinois, July 17, 1903.

WESLEY FRISE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. Wesley Frise; city of Pearl; fisherman.

Q. How long have you been a fisherman upon the Illinois river?

A. Well, about twelve years.

Q. How far up and down the river have you fished from this point during that twelve years?

A. To Hennepin. As far up as Hennepin and down to here.

Q. What was the condition of the waters of the Illinois river before the opening of the drainage canal in January, 1900?

A. Well it was pretty bad water stagnated and scummy.

Q. Did it have any smell?

A. Yes sir; it would stink in the summer time when the water got down low it would smell and in the winter time when you would cut a hole in the ice, there would be a regular gas come from the water, and I have cut holes in the ice where dead fish would come right up through the hole, from the gas I guess and stagnated water.

5256 Q. Where upon the river, and in what years do you remember to have found this condition under the ice?

A. Well I remember of two winters its being that way, but I don't remember just how long ago; one was at Hennepin and the other was at Lacon, but that has been, oh, eighteen years ago.

Q. How far above Peoria is Hennepin?

A. Well it must be 60 or 65 miles; I think we call it 45 miles from Peoria to Lacon, and I think it must be 35 miles from there to Hennepin.

Q. Did you fish any in the winter near Pearl prior to the opening of the drainage canal?

A. This is three years I have been to Pearl; this makes the third winter here, last winter. No, I didn't fish any before.

Q. Could you drink the water when you were on the Illinois river before 1900?

A. No sir, I couldn't, with all the scum you would just have to brush it away and then couldn't get nothing.

Q. Did it have a smell in the summer?

A. Yes sir.

Q. Where were you fishing in the years 1897, 1898 and 1899, before you came to Pearl?

A. Beardstown and Frederick.

Q. What was the condition of the waters at those two places during those three years?

A. Well, we had some pretty bad water there.

5257 Q. How far from Beardstown and which way on the river from Beardstown, is Frederick?

A. It is up the river about four miles from Beardstown.

Q. While at Beardstown and Frederick did you cut holes in the ice in winter in order to fish?

A. For awhile yes, we cut holes in the ice there for the nets.

Q. You may state whether or not you found an odor or smell in the water under the ice at Beardstown and Frederick?

A. Yes sir, I have, smell gas when you cut a hole in the ice.

Q. When you were at Beardstown and Frederick did you drink the water of the Illinois river when fishing?

A. No sir, not much, in the winter we would dip up a bucket full and use to wash out of it and caught out putting in nets and caught dry, had to take a drink of it.

Q. Now since the opening of the drainage canal, what has been the condition of the water?

A. Well, I claim it has been pretty fair, good water.

Q. Has it any smell now?

MR. JEFFRIES: Objected to as leading.

A. No sir, I never smell anything.

Q. Do you drink it now since the opening of the canal?

A. Why we do drink it sometimes, yes; I used it a good deal this week and when I have been out up the river I
5258 drink it right along.

Q. How does it compare for drinking, with the water before the drainage canal was opened?

MR. JEFFRIES: Objected to.

A. It is a good deal better; I don't see no scum on it now; it is cooler and clearer.

Q. Do you know of any cases of typhoid fever among the fishermen since the opening of the drainage canal?

A. No sir, I do not; there hasn't been none here that I know of and I haven't heard of any.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. Where did you say you lived?

A. Pearl.

Q. Live on a boat or in a house?

A. Boat.

Q. How long have you lived on a boat?

A. About eight years.

Q. You say the water is better now than it was before the canal was opened, you mean by that that there is more volume and current, more water and more current?

A. Yes sir.

5259 Q. How much more current is there?

A. Well, I don't know just how much more, but there is a good deal more than what there was before.

Q. There is a good strong current isn't there?

A. Yes sir.

Q. At all the times of the year?

A. Yes sir.

Q. You don't know whether the water contains any deleterious substances or not do you?

A. No sir, I don't.

Q. You don't know whether it contains anything that is harmful?

A. No sir.

Q. What fish thrive best in this river?

A. Well the carp I believe does.

Q. Do you know what the carp feed on?

A. Oh they feed on pretty near everything; they will eat most anything. With a trot line they will feed on mussels, crawfish and dough-balls; I have catched them on roasting ears, the grains.

Q. Do they feed on flesh, dead meat?

A. No, I don't believe they do. I never caught any with any.

Q. Did you ever try it?

A. I did with beef and never caught any.

5260 Q. How far up does this good current go?

A. Well I guess it goes all the way up as far as I have been since it started in.

Q. Up as far as Hennepin?

A. Peoria, I have been as far as Peoria since it was turned in.

Q. A good current all the way up to Peoria?

A. Yes sir.

Q. About all you know about this water is that there is a stronger current, more water and better fishing?

A. Yes, and I believe it is better water.

Q. Well you just think so?

A. No I don't think so; I know so.

Q. Why do you know it?

A. Well sir, simply because you don't see this scum along here and this stagnated water and you don't smell this gassy smell any more like you used to.

Q. Don't you know that fish die under the ice in winter time in extremely cold weather on any river?

A. Well I have seen them die right here in the summer time on this river.

Q. Well I mean under the ice?

A. Well not if the water is pure, they won't.

Q. Did you ever live on any other rivers?

A. Yes sir.

5261 Q. What rivers?

A. I lived on the Mississippi, the Big Blue and on the Solomon river.

Q. Were you born on the river?

A. No sir, not exactly.

Q. Was your father a fisherman?

A. No sir.

Q. Where did you live on the Mississippi irver?

A. Hamburg.

Q. Hamburg where?

A. Mississippi, down below Louisiana.

Q. You never saw much ice on the Mississippi river?

A. I seen a lot of it that winter running.

Q. You never saw it frozen over though?

A. Yes, I seen it frozen over.

Q. That winter at Hamburg?

A. Yes sir, and I saw it frozen over several times since.

Q. For a very short time though?

A. Yes sir, not very long.

Q. You have never been up on the Mississippi river?

A. Yes sir, as far as Quincy.

Q. Did you ever live at Quincy?

A. No sir, never lived at Quincy.

5262 I have been there.

Q. In the winter-time?

A. Yes sir, I have been there in the winter time.

Q. Did you ever see the ice frozen over there?

A. Yes sir, I saw it frozen over there one winter.

Q. For how long a time?

A. Oh, I don't know. I wasn't there but just a day.

Q. You don't know then that when the Mississippi river above Quincy freezes over until the ice becomes very thick from eighteen inches to two feet thick and continues frozen for some time, that if you cut a hole in the ice the dead fish will come up?

A. No sir, I don't know that.

WESLEY FRISE.

5263 **Pearl, Illinois, July 17, 1903.**

JOHN WILDT,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. John Wildt, I have been in the fish business for quite a while and I live at Pearl, Illinois.

Q. Are you a buyer and shipper of fish?

A. Yes sir.

Q. How long have you been in that business?

A. I have been in the fish business about 18 or 19 years; not steady though; I was off one time for about two years.

Q. Have you been in that business and buying fish caught in the Illinois river?

A. Yes sir.

Q. For how long a time?

A. Fifteen years with the exception I was away two months and a half last winter and I was away four or five months last summer; not regular I wasn't in the fish business regular last summer.

Q. Have you been a fisherman yourself?

A. Yes sir.

Q. On the Illinois river?

A. Yes sir.

5264 Q. What was the condition of the water of the Illinois river before January, 1900?

A. Why I don't know as I could tell you the exact condition of it. Before January, 1900?

Q. In other words before the opening of the drainage canal?

A. Why we had a very slow river, there was no current, no flow and the water would get very stagnant.

Q. How did it smell?

A. Why, it had a very bad smell, gas like.

Q. In buying and shipping fish, did you use ice in packing them?

A. Yes sir.

Q. From where was the ice obtained?

A. From the Illinois river generally; at times of course I would use ice that was shipped in.

Q. Before the opening of the drainage canal, what was the condition of the ice?

A. Oh, I don't know that you could see very much difference in the ice; I couldn't see any difference in the ice at all; I have cut ice and put it up on the river myself whenever we could get ice in the last twelve or fifteen years, and I notice one particular time, I think it was about 1896 or 1897, some time along there, that we had a real good heavy ice, probably fourteen or fifteen inches; I put up ice at Gravel Point 5265 at that time, and also at this place, and I noticed when cutting ice at that time there was a gassy smell where you would open the ice and the water looked as though there was a dark scum on it, and I would see where you would open a hole the fish would be floating by and they would seem very numb like they were dead, and that ice broke up, if I remember right, in February, along the latter part or middle of February, and there was quantities of fish died, smothered under that ice that winter, and they passed over the dam at Kampsville. I remember that the boys got to catching them there with forks and dip-nets; there where the water run over it left a little open place. They would float out over that and they would catch them and they bought them there for New York, and the Commissioner stopped them; they claimed it was unlawful to do that, and stopped them, and after that ice went out you saw catfish all along the edge of the water where they floated up, we used lines on our nets and raised them with a line.

MR. JEFFRIES: I object to the answer and move it be stricken out for the reason that it is not responsive and for the further reason that it is a well known fact that when the ice is frozen upon a stream to the thickness as described by the witness, and remains for the length of time, a considerable length of time, that the fish in the water will die unless there are air-holes or openings, and that frequently when these 5266 air-holes are frozen it is very disastrous to the fish, and therefore such evidence is incompetent, irrelevant and immaterial; and for the further reason there is no evidence showing that such has been the continued and continuous occurrence during the history of the Illinois river.

Q. What has been the condition of the Illinois river since the opening of the canal?

A. There seems to be more current and the water clears up faster after a rain and after a flood.

Q. Is there an odor in the water now since the opening of the canal?

A. I think the water is more clearer now than it was before the opening of the canal.

MR. JEFFRIES: Move to strike the question and answer out, the answer not being responsive to the question.

Q. Is the water fit to be used for drinking since the opening of the drainage canal?

MR. JEFFRIES: Objected to as the witness has not qualified to testify on that point.

A. I drank some of it the other night; I never drink it unless I have to.

5267 CROSS-EXAMINATION, By Mr. Jeffries.

Q. Where did you say you lived?

A. Pearl.

Q. The people here in Pearl have wells or cisterns?

A. Yes sir.

Q. They don't use the water of the Illinois river?

A. Not without they have to.

Q. It is not considered good water by them?

A. Not in the summer season, no.

Q. Do you know whether or not the freezing of the river in the winter time when the ice is frozen 18 inches or two feet thick and continues for some time until the air holes in the ice are frozen over that it will have a bad effect on the fish in any kind of water?

A. I think that it does, yes sir.

Q. Then you couldn't say that this occurrence that you referred to was caused altogether by the water?

A. No, I think—no I don't think it was caused altogether by the water.

Q. There was no current at certain times before the canal was opened?

A. Very little at times.

Q. And there has always been a good current since?

A. Yes sir.

5268 Q. And that is the only reason that you have for believing it?

A. It shows that it is better; it is cleaner; we don't have so much scum.

Q. You don't know whether it contains deleterious matter or not?

A. I don't know a thing about that.

Q. What has become of that scum and green matter?

A. I supposed it is washed out; I don't know; I don't see it any more; I couldn't tell where it went to.

JOHN WILDT.

[illegible]

5269 Pearl, Illinois, July 17, 1903.

JOSEPH HALL,

called as a witness in behalf of the defendants being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Joseph Hall.

Q. What is your business?

A. Fisherman.

Q. Where do you live.

A. Pearl, Illinois.

Q. How long have you lived here?

A. Three years.

Q. Where did you live before coming here?

A. Frederick, Illinois.

Q. Is that on the Illinois river?

A. Yes sir.

Q. Where is it located?

A. Four miles above Beardstown.

Q. How long have you been fishing on the river?

A. Ever since 1881.

Q. Will you describe or tell in your own way the condition of the waters of the Illinois river before the opening of the drainage canal?

5270 A. I think I can.

Q. Well, do so please?

A. Well, in the summer time, when the water would get down pretty low why the water was pretty bad in the Illinois river; it had a green scum on it; but since that drainage canal we don't see that any more, and the water is more pure; we use the water more or less all the time. The water was better last year than I ever saw it on the Illinois river, and take it in the winter time when the water would get low and froze over, why the water would get stagnant. I have cut holes up there at Beardstown seven years ago this winter that the fish died right in the net and cut a hole in the ice and the water smelled so you couldn't hardly stand it. The water was just like there had been coal oil poured in it.

Q. What has been the condition of the water since the opening of the drainage canal?

A. Well sir, it is better than I have seen it for a good many years on the Illinois river.

Q. In what way is it better?

A. Why it is purer, we don't have that gas and no green scum on the river, and it has more current.

5271 Q. Have you seen ice made since the opening of the drainage canal, on the Illinois?

A. Yes sir, make it myself every winter; I put up ice every winter.

Q. When you cut holes through the ice now, how does the condition compare with what existed prior to the opening of the drainage canal?

A. Well sir, there is a big difference.

Q. Tell it.

A. The water is pure and clear; you can see the bottom in five or six feet of water and the water tastes better.

Q. Any gas?

A. No sir, I have never noticed any gas now.

Q. Any dead fish?

A. No sir, no dead fish, except what has been killed by the fishermen; haven't any been killed that I seen, by bad water.

Q. Do you drink the water?

A. Yes sir.

Q. Have you heard of any cases of typhoid fever of people drinking the water?

A. No sir I have not. We use the water all the time in
5272 the winter time, right in the family.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. You live in a boat house?

A. Yes sir.

Q. How long have you lived in a boat house?

A. I have lived in a boat-house for about eleven years.

Q. The only difference between the water now and what it was before the canal was opened, is that there is a stronger current and a larger volume of water?

A. Yes sir, there is a larger current and the water keeps purer.

Q. That is it looks to be purer?

A. It is; a man can tell it when he drinks it.

Q. How much more water is there now than before?

A. Than before?

Q. I mean before the opening of the canal?

A. It has been averaging about sixteen inches here; from sixteen inches to two feet.

Q. What fish do they catch, or what fish thrives best in this water?

A. Why German carp, I think.

Q. Do you know what they feed on?

5273 A. No, I don't.

Q. Do you know what they don't feed on?

A. No, I don't; they seem to feed on crawfish pretty well; they bite well on that.

Q. There is a good current in the river now at all times, is there?

A. Yes sir, there is a good current.

Q. You don't know whether the water contains deleterious matter or not, do you?

A. No, I don't.

Q. Matter that is harmful to the human system?

A. No.

Q. You never had it analyzed?

A. No sir, I never did.

Q. How long have you been fishing you say?

A. Ever since 1881.

Q. How old are you?

A. Forty-eight the 14th day of last March; I was born in 1855.

J. S. HALL.

5274 Pearl, Illinois, July 17, 1903.

GEORGE HOPPLER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. George Hoppler.

Q. Where do you live?

A. Right here in Pearl.

Q. What is your business?

A. Fisherman.

Q. How long have you been a fisherman?

A. Well ever since I was about 16 years old; I am about forty now; forty-one; that's my business, fishing.

Q. Will you describe the Illinois river before the opening of the drainage canal in your own way as to the conditions of the water and its effects upon fish in winter?

A. The water, take it in July and August, it wasn't any good; it had a green scum on it; and in the winter the water would get so stagnated the fish would die; it wasn't fit to drink nor nothing else.

Q. Did the water have a perfume?

A. Well it smelled awful bad and it would get red; the
5275 last part of it you know, when it gets bad, it turns plumb
red. I fished here one winter when we would go and cut our nets out of the hole and there would be fish come up in the hole dead you know; the water was bad.

Q. Was there any oily substance on the water?

A. Yes, kind of looked like coal oil.

Q. Since the opening of the canal describe how, if anything, the water has changed?

A. Oh yes, the water is better in the winter time; when the river is froze over it is better in the winter time than it was before the canal was turned in.

Q. Do you notice any green scum on the water now?

A. No sir.

Q. Any of that coal oil substance?

A. No sir, I think the water is a good deal better and purer.

Q. Do you have any perfume as you did before?

A. No sir.

Q. Have you drank the waters of the Illinois river?

A. Yes sir.

Q. How often?

A. Every winter.

Q. How many people are engaged in the fishing business at this point?

A. Well there is several; about five fishermen at Pearl here.

5276 Q. How many men do they employ?

A. They are just two you know; two partners is all the party and then there is a good many fishes here during the winter time that farms during the summer time.

Q. How does the water taste today, as compared with the water of the Illinois river prior to the opening of the canal?

A. Why I don't know; I haven't drank any lately; but the water looks a good deal better than it did before the canal came in here.

Q. Since the opening of the canal have you noticed any deleterious substances in the water?

A. No sir.

CROSS-EAMINATION, By Mr. Jeffries.

Q. What do you understand by the word deleterious?

A. Oh, I should think it would be stagnated, ain't it?

Q. Well I am asking you?

A. Well, that's what I take it for.

Q. The water is not stagnated now?

A. No sir.

Q. Was it before the opening of the canal?

A. Yes sir.

Q. At certain seasons of the year there was no current?

A. No current.

5277 Q. How is it now?

A. Well, there is a good current now.

Q. In fact a good current?

A. Yes sir.

Q. At all times?

A. Yes.

Q. Do you live on the river?

A. Yes sir.

Q. On a boat?

A. Yes right up here at the bridge.

Q. How long have you lived on a boat?

A. About ten years.

Q. Do you use the water from the river?

A. Yes in the winter time.

Q. Do you always use it from the river?

A. Yes, in the winter time; it gets warm in the summer time and we have to put ice in it.

Q. About the only difference there is in the water now, material difference is caused by the increased flow and increase in volume since the opening of the canal?

A. I think so.

Q. You don't know whether the sewage from Chicago gets down here or not?

A. No.

5278 Q. How is the stage of the water now compared with what it has been the last three years?

A. Well it is lower now than it has been.

Q. And still you have a good current?

A. Yes sir.

GEO. HOPPLER.

Adjourned at 8 p. m. to meet at Naples, Illinois, July 18, 1903, at 8 a. m.

5279 Naples, Illinois, July 18, 1903, 8:00 A. M.

Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

W. H. WATERS,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:—

Q. What is your name, residence and occupation?

A. W. H. Waters; Naples, Scott County, Illinois; my occupation is fish dealer.

Q. How long have you lived at Naples?

A. Twenty-four years.

Q. How long have you been dealing in fish?

A. On and off all the time.

Q. Have you also engaged in the catching of fish by nets?

A. Yes sir.

Q. As an employer or as an actual worker?

A. Why, both at different times.

Q. Has your business made you familiar with the waters of the Illinois river at this point?

A. Yes sir.

Q. To what extent in miles are you acquainted with the
5280 river above and below this point?

A. As far as my fishing goes, about four miles above and about ten miles below; make it about fourteen miles.

Q. If you have engaged any in putting up ice, from the Illinois river state to what extent and during how many years?

A. I have put up ice out of the river on and off for about eight years; on and off, myself; some years out of the river and some years out of the creeks and lakes.

Q. How far is Naples from Kampsville dam?

A. About 38 miles.

Q. How far is it, from Pearl?

A. That would be about 26; somewhere about 26 miles.

Q. How far from Beardstown, up the river?

A. About 25 miles.

Q. How far from LaGrange dam?

A. About thirteen miles.

Q. What was the condition of the Illinois river before January, 1900, when the drainage canal was opened?

A. Well, we had a very low stage of water at times, and in the summer time a little scum would come on, kind of a green scum; which would last probably for two or three weeks.

Q. Do you know whether the fishermen drank the water at that time?

A. Well, not in the warm weather they didn't, but in the early spring and late fall they did. 5281

Q. Prior to the opening of the drainage canal and since, did you have a general acquaintance with the people of this community and especially with those whose business was upon the river?

MR. JEFFRIES: Objected to as leading.

A. Yes, sir, with a good many of them; quite a good many that made a business of fishing and being on the river.

Q. Prior to the opening of the drainage canal, what was the condition of health among the people whose business kept them upon the river?

A. Well, I don't know; there wasn't very much sickness here; it was generally fair.

Q. How with reference to typhoid fever?

A. Well, there wasn't but a very few cases here to my knowledge.

Q. Since the opening of the drainage canal, what has been the condition of health among the same class of people?

A. Well, about the same; I don't notice much difference; that is right around in this vicinity. Of course I ain't much acquainted outside of that. This is a healthy point though.

Q. How about typhoid fever since the opening of the drainage canal?

A. Well, I haven't heard of any around here.

5282 Q. Prior to the opening of the canal what was the condition of the water in the river in the late summer with reference to smell?

A. Well, sir, I noticed no scent, in particular of it; but I noticed a green scum which lasted about two or three weeks, as I said during the extremely hot weather; the river got much lower than it does now at the same time of the year.

Q. What was the condition of the ice here, taken from the river, before the opening of the drainage canal?

A. Well, that varied, even before the canal went in; it was owing to the condition of the river, or the condition what the river was in when it froze up. If the river was muddy when it froze up the ice would naturally have more or less sediment in it; if the water was clear when it froze up, why, the ice would be more clear.

Q. Since the opening of the drainage canal what has been the condition of the water in the river?

A. Well, sir, it has been clearer and purer up to this spring; purer, I say, so far as I have noticed it has been purer; I haven't analyzed it, you understand; it has been clearer and looks better.

Q. What was the condition this spring, this summer?

A. This summer it has been more riller than I have noticed it for years; more muddier at this point than I have noticed it for years. 5283

Q. Are you able to account for that?

A. No, sir, I am not.

Q. Since the opening of the canal has there been any of this scum upon the river that you have spoken of?

A. No, sir, I haven't noticed any.

Q. If you have taken any ice from the river since the opening of the canal, state its condition?

A. Well, sir, the ice was thin, it would only freeze about six inches; but what we got was good clear, pure ice.

Q. Do you remember before the opening of the canal, occasions through the winter when there was some odor in the water where the river was frozen over that affected the fish, and if so, state what you know with reference to it?

MR. JEFFRIES: Objected to as leading.

A. Well, not to my own knowledge; I stay at the boat a good deal and wasn't out and all I know is what I have heard the fishermen say; the river at this point hardly ever freezes over entirely.

Q. As a fish dealer, did you receive complaints about the scent of the fish or the smell of the fish which you sold to people in the country?

MR. JEFFRIES: Objected to as leading.

A. It was more the fish than it was the smell; they com-
5284 plained more about the taste than they did the smell;
claimed that they tasted like coal tar.

Q. When was that?

A. That was, I think, about seven or eight years ago; I am not sure, about seven or eight years ago.

CROSS-EXAMINATION, by Mr. Jeffries.

A. Do you know that they tasted that way?

A. No, not from my own knowledge.

Q. You live here in Naples, do you?

A. Yes, sir.

Q. How large a place is Naples?

A. It is about 400.

Q. The people have wells and cisterns, don't they, that they use the water out of?

A. Yes, sir; wells mostly, sand-pumps; they are not wells; sand pumps.

Q. You have a well at your house?

A. A pump, yes, sir.

Q. How does the flow of the water compare since the opening of the canal with what it was before the canal was opened?

A. I did not quite understand the meaning. The current?

Q. The current?

A. The current has been very sluggish here this year;
that would be on account of the high water in the Missis-
5285 sippi. The current, though, as a general thing, since
the canal was turned in was a little swifter.

Q. The water from the Mississippi backed up this far this last spring, did it?

A. It didn't get quite this far, no, sir; it got within about seven or eight miles of us, I think.

Q. How long did that last; just a short time wasn't it?

A. About two weeks, I think, about ten days or two weeks.

Q. That had no effect on the water here?

A. Yes, sir; of course we didn't have no back water; but we had very little current here; it naturally would have an effect on it.

Q. Outside, then, of this back water from the Mississippi you have had a splendid current since the opening of the canal?

A. Yes, sir; the water has been all right.

Q. What species of fish thrives best in this water?

A. We haven't got any but what thrive well; carp is more abundant than any other fish.

Q. Do you know what the carp feed upon?

A. Why, some kind of vegetation in the bottom, some feeds on green grass, green hay, wheat or anything where it would be overflowed.

Q. Is the river low or high now compared with seasons to what it has been since the opening of the canal?

5286 A. Well, it is about normal now; that is speaking of it since the opening of the canal?

Q. Yes, altogether.

A. Yes, sir.

Q. You say there has been some typhoid fever here in the last several years?

A. There has been some two or three cases, I presume.

Q. I understood you to say that you had made no examination of the water?

A. No, sir.

Q. And you don't know whether it contains deleterious matter or not?

A. No, sir, I couldn't say as to that.

Q. There has been no ice to any great extent, cut here for several years, has there?

A. No, sir, there has been no big amount. Probably 200 tons a year.

Q. And that is mostly cut from the ponds and lakes?

A. Yes, sir; sometimes we would get it out of the river.

W. H. WATERS.

5287 Naples, Illinois, July 18, 1903.

WALLACE HART, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Wallace Hart.

Q. Where do you live?

A. I live in Naples.

Q. How long have you lived in Naples?

A. Thirty years.

Q. What is your business?

A. Well, I am notary public here now and town clerk; I ain't able to work at anything else.

Q. How old a man are you?

A. 69 years old.

Q. How long have you been familiar with the Illinois river?

A. All my life.

Q. You have been on and off the river most of the time?

A. Yes, sir.

Q. Will you describe the condition and quality of the water of the Illinois river before the opening of the drainage canal in January, 1900?

5288 A. Well, I don't know as I could describe it exactly; I never gave it much thought. I know it was low and almost stagnant; there was a green scum on it and a bad smell in the evening, especially in the evening and at night, from the river to my house is probably just a half a block from the river and I noticed that smell.

Q. Did you see any dead fish in the river?

A. Yes, sir, I saw lots of them floating in the river up above here, along the banks of the river; and I have seen them dead up here, big catfish, where I went to fish with a hook and line.

Q. What has been the effect upon the water of the Illinois river of the opening of the drainage canal?

A. Well, there has been more water in the river and it looked clearer and purer to me and I haven't seen any dead fish, scarcely any since.

Q. Any odor?

A. Well, I haven't noticed any. Come to think about it, I haven't noticed any odor since that canal has been turned in.

Q. How does the clearness of the water at present compare with its clearness before the opening of the drainage canal?

A. Well it is a great deal clearer than it was before.

5289 Q. How many people are engaged in the fishing business at this point?

A. I declare I don't know how many.

Q. Approximately?

A. I think there is ten or twelve.

Q. How many people live at this point in river boats?

A. There is an old gentleman lives down here on the bank, mighty near on the river boat; there is a river boat stops here occasionally.

Q. Is there any typhoid fever in this town?

A. Hardly ever hear of a case of typhoid fever, that is, for the last two or three years.

Q. What is the population of Naples?

A. 480, our last census.

Q. Do you know how far Naples is from the mouth of the Illinois river, or Grafton?

A. Well, I don't know exactly; I think it is about 45 miles.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long have you lived here?

A. Thirty years.

Q. Been fishing for thirty years?

A. No, sir; I have hardly fished any at all, only with a hook and line.

5290 Q. You haven't been out on the river any?

A. No, sir; I live right up just about two-thirds of a block from the river and go along up the river bank there to home, two and three times a day.

Q. There is a much better current now than there was before the canal was opened, isn't there?

A. Yes, sir; a good deal better.

Q. You have a well or a cistern at your home?

A. Yes, sir; I had an open well, but I filled it up and put in a pump.

Q. What they call a sand pump?

A. Yes, sir.

Q. Do you get the waters you use for household and drinking purposes out of this pump?

A. Yes, sir.

Q. The people generally don't drink the water from the Illinois river, do they?

A. Not those that live anyways back from the river don't; but those that lives right on the river probably do.

Q. Those that live in house-boats?

A. Yes, sir.

Q. That is just a supposition of yours; you don't know it personally?

A. No, sir.

5291 Q. About the only change in the water as far as you know is that there is a larger volume of water and a better current now than before the opening of the canal, and for that reason the water doesn't get stagnant?

A. No, the water doesn't become stagnant like it did before and it don't have that smell to it that it did before.

Q. You don't know what the water contains, in the way of deleterious substances?

A. No, sir.

Q. You don't know whether it contains more now than it did before the opening of the canal?

A. No, sir.

Q. Or whether it contains less?

A. No, sir. WALLACE HART.

5292 Naples, Illinois.

WALTER SURRATT, called as a witness in behalf of the defendants, being first duly sworn, was examined in chief by Mr. Todd and testified as follows;

Q. What is your name?

A. Walter Surratt.

Q. Where do you live?

A. Naples.

Q. How long have you lived here?

A. Twenty years.

Q. What is your business?

A. Fisher.

Q. Have you done anything else but fish?

A. Well, no; I am a practical fisherman.

Q. Were you acquainted with the Illinois river before and since the opening of the canal?

A. Yes, sir.

Q. Describe the condition of the Illinois river before the opening of the drainage canal in 1900?

A. Well, it seemed foul and stagnant, and fish wouldn't live in it, and the water was low and the water wasn't pure at all.

Q. Was there any scum on the water?

5293 A. Yes, sir; during the summer season.

Q. Any odor?

MR. JEFFRIES: Objected to as leading.

A. At places there was odor where there was a kind of an eddy or anything there would be an odor.

Q. Did you ever fish through the ice?

A. Yes, sir.

Q. Describe the condition of the water?

A. Well, before the opening of the canal a kind of a substance would form on the net; it was something like grease, and through the summer season the nets wouldn't last any length of time.

Q. How would you fish through the ice?

A. I don't get to understand what you mean.

Q. Would you cut holes through the ice?

A. Yes, sir.

Q. Would the fish live in the nets under the ice?

A. Yes, sir, some of them lived; part of them would die; they didn't seem to be healthy and lively as they have been; we would lose some fish.

Q. Since the opening of the canal, what has been the effect of the waters from the drainage canal upon the waters of the Illinois river at this point?

A. Well, we have a good current; we haven't had none 5294 of the green scum on the water, and the fish seem to live better; we have more fish in the river in my judgment; it fills up the lakes and I believe that it really helps the lakes in purifying because we don't quite have near the moss in the lakes we had, as well as in the river; we have had grass and stuff growing in the river.

Q. How about the quality of the water?

A. It is more pure than it was.

Q. Have you made ice here in the winter before and since the opening of the canal?

A. Yes, sir.

Q. How does the ice at present compare with that before the opening of the canal?

A. Why, the ice is clear; before it would be dark, and a dark substance in it; at places you would get moss in the ice at low water.

Q. In winter do you have this oily substance on the waters that you had before?

A. No, sir, we don't, because I made a remark to my partner, that we never had such water before.

Q. Did you discover any odor under the ice since the opening of the canal?

5295 A. No, sir, I haven't. I fished down here on Clear Lake last winter where it is fed some by the river and we use the lake water some and never noticed the odor; and years before that we fished there, we couldn't use the water on Clear Lake.

Q. Have you had occasion to observe whether fish would live in live-boxes any better since the opening of the drainage canal than they would before?

MR. JEFFRIES: Objected to as leading and immaterial.

A. Yes, sir, they have. Well, last summer I hadn't a trot line in it; but this year I trot-lined and I keep my fish now from four to five days, and years before that several years ago, we would have to dispose of them every other morning or every morning, and then we would lose half of them, and I haven't had any fish to die on me this year.

Q. Have you fished with nets during the last few years?

A. Yes, sir; all the time.

Q. Are you fishing with nets now?

A. No, sir, not now.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Did you have any fish die here last year?

A. No, sir, I wasn't fishing with no trot-lines last year.

5296 Q. This is just the beginning of the hot season, isn't it?

A. Yes, sir.

Q. So, you don't know whether you are going to have fish die on your hands this year or not?

A. Oh, well, fish commence dying on us long before this—years before.

Q. Now, before the canal was opened, you fished right along, did you, all the time?

A. Yes, sir.

Q. What did you do with the fish?

A. I sold them to the markets here.

Q. You sold them to the markets when you knew they were bad fish?

A. Well, years before, what lived I sold here.

Q. Were the fish in the Illinois river before the opening of the canal condemned by the State Board of Health as unhealthy?

A. I don't know.

Q. Not to your knowledge?

A. I didn't understand —

Q. I want to know if the State Board of Health condemned the fish in the Illinois river before the opening of the canal?

A. Not to my knowledge.

Q. Isn't it a fact that the Illinois Fish Commission would re-stock the river with small fish, minnows?

5297 A. Restock this river?

Q. Yes?

A. I don't see what they would re-stock this river for; they would take the minnows and the fish out of here and restock the lakes and ponds.

Q. Then they took the minnows and fish out of this river and re-stocked lakes and ponds before the opening of the canal?

A. Well, I suppose that they took some out of the river.

Q. Well, don't you know that they did?

A. No, sir, I don't know that they did, I suppose.

Q. You sold your fish on the market before the canal was opened?

A. Yes, sir.

Q. The same market that you sell them in now?

A. Well, I sold them to several markets up and down the river.

Q. Both before and after the opening of the canal?

A. Yes, sir.

Q. About the only difference in the Illinois river now, and before the opening of the canal is that there is a stronger current and a greater volume of water, isn't it?

A. Well, at different periods we have got a better current in here and we don't have the stagnated water that we had before. 5298

Q. In fact, you have a good current all the time now?

A. Yes, sir; we have had a good current for the last two years.

Q. Since the opening of the canal?

A. Since the opening of the canal.

Q. Where do you live?

A. I live here at Naples.

Q. Do you have a pump or a well at your house?

A. No, I use the town pump.

Q. You don't drink the water of the Illinois river unless you have to, do you?

A. Yes, sir—well no, I drink it out when I have been fishing.

Q. How long have you been fishing?

A. Well, I have been fishing ten or fifteen years, I guess.

Q. What has become of that green scum that formed on the river?

A. Well, I suppose that the current has taken it out here and gathered up all that moss and stuff and flowed out.

Q. You don't know whether or not the sewage from Chicago comes down here?

A. No, I have never been up there; but I suppose from the reports in the papers that it comes past here.

Q. It comes past here?

A. The water passes here coming out of Chicago.

5299 Q. Now, you don't know whether the water here contains any deleterious matter or not?

A. Well, you will have to explain what that word means.

Q. It means harmful, or anything unwholesome?

A. No, I don't know as it does; I have used right smart of the river water and I have been healthy; when I would be out fishing I have drank it.

Q. That is the only way you have of judging it?

A. Yes, sir, that is the only way I have of judging it.

Q. You drank it before the opening, didn't you?

A. Yes, sir; I drank it before the opening.

W. W. SURRATT.

5300 Naples, Illinois, July 18th, 1903.

JAMES WATERS, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. State your name, residence and occupation?

A. James Waters; Naples, Illinois; fisher.

Q. How long have you resided at Naples?

A. 23 years.

Q. How long have you been a fisherman?

A. Ever since I was big enough to fish; I was about twelve years old when I first commenced to clean fish on the boats.

Q. How far up and down the river from this point have you fished?

A. Well, sir, I have fished as far up as Browning.

Q. How many miles is that?

A. That is 36 miles.

Q. How far below?

A. About ten miles below.

Q. What was the condition of the Illinois river before the opening of the drainage canal?

A. Why, it seemed like it was kind of stagnated; slime
5301 and scum on the water.

Q. Was there any smell in the water?

A. Yes, sir, it smelled like tar to me.

Q. Before the opening of the drainage canal if there were any times when the river was frozen over, you may tell what occurred with reference to the fish and what was the condition of the water as to smell?

A. Well, I know I and my brother was fishing together for some years before the canal was opened; we was raising nets that winter and the fish would drift down against the leads, and in the leads in the nets would be big catfish and white perch; used to get them and they would be dead, you know, on the ice.

Q. How frequently did that occur?

A. Well, that was two straight winters that I know of.

Q. What years, if you remember?

A. Well, I don't hardly remember; it seems like it has been about six or seven years ago.

Q. Before the opening of the canal, what was the effect of the water upon your nets?

A. It was slime, you know; when you would raise the nets, it would be slime on it and you could hardly get it off; it would block in the meshes of the nets, the slime would.

Q. What was the color of that slime?

A. Well, it was kind of greenish.

5302 Q. Would the nets last as long as since the opening of the canal?

MR. JEFFRIES: Objected to as leading.

A. No, sir, I don't think they would.

Q. Since the opening of the canal what has been the condition of the water?

A. It has been more purified than it was before.

Q. In reference to the smell?

A. Why, it don't smell like it did before; in fact, there is no smell to it. I know I drank some of it here about a month ago.

Q. How about the moss?

A. Well, there is no moss that I can see.

Q. Do the fishermen in this community drink the water of the Illinois—did they before the opening of the canal drink the water of the Illinois river?

A. Not much to my knowledge.

Q. Since the opening of the canal do they drink it?

A. Yes, sir.

Q. Among the people who drank the river water before the opening of the canal, was there typhoid fever?

A. Yes, sir, and a good deal of chills, too.

Q. Since the opening of the canal how about typhoid fever and chills?

5303 A. Well, sir, I don't know of any here in town.

Q. Did you engage in putting up ice before the opening of the canal?

A. Yes, sir.

Q. What was the condition of the ice at that time?

A. Why it seemed more like slimy and dirty looking than what it is now.

Q. Since the opening of the canal have you put up some?

A. Yes, sir; put up some every year.

Q. What was its condition?

A. We put up some as fine ice last winter as we ever had.

Q. Since the opening of the canal has the condition of the ice been generally better than before?

A. Yes, sir; I think so. Better than it was last winter.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Where was this ice cut?

A. Up here in the lake.

Q. What lake?

A. Smith Lake.

Q. How large a lake is that?

A. Oh, it must be a mile and a half or two miles long.

Q. How deep is it?

5304 A. Why, I don't know exactly; it is deeper this year than it generally was, or last winter when we generally put up ice. It was so shallow in there we couldn't put up ice before the canal came in.

Q. Does that lake empty into the river?

A. Yes, sir.

Q. It is stagnant water, is it, still water?

A. Why, yes, it was; I don't know what it is now. I haven't been up there this summer.

Q. It was last winter?

A. Well, I couldn't say that it was.

Q. How long did you say you have been fishing?

A. I have fished all my life, ever since I was big enough to.

Q. How old are you?

A. Thirty-three.

Q. Your father was a fisherman?

A. Yes, sir.

Q. Where do you live?

A. I live here in Naples.

Q. In a house boat?

A. No, sir; I live in a house back from the river one block.

Q. Do you have a pump or well or what?

A. Pump.

Q. Get the water out of the ground?

5305 A. Yes, sir.

Q. You use the water from this pump for household and drinking purposes?

A. Yes, sir.

Q. You never drink the water from the river unless you are out upon it and can't get any other?

A. Oh, no; no, sir.

Q. The people here don't use the water for domestic purposes—the water from the river?

A. No, sir, not that I know of.

Q. Now, before the canal was opened, the fish from the Illinois river had not been condemned by the State Board of Health, had they?

A. I couldn't say whether they had or not.

Q. You sold them in the same market that you sell now, didn't you?

A. Yes, sir.

Q. There were no objections at that time that they were bad fish, that you sold?

A. Why, no, sir; not that I remember.

Q. Now, as a matter of fact there are always more or less dead fish floating in the river in the winter time because they don't decay as rapidly in the winter time as they do in the summer?

5306 A. Well, I have never seen them like that before or since.

Q. That was one particular winter?

A. Two winters.

Q. But it was not a continuous thing every winter before the canal was opened?

A. No, sir.

Q. You have seen some fish dead in the winter time since the canal was opened?

A. I couldn't say as I have.

Q. What fish thrive best in this river?

A. German carp.

Q. Do carp feed on manure—

A. I don't know; most anything, I guess.

Q. You don't know whether this water contains substances that are unwholesome or not?

A. I don't know what you mean by that.

Q. Substances that would be harmful to the health by continuous use of the water for domestic purposes?

A. I don't think it does, because I have used it in the winter time, when I am out fishing, and I have drank it when I was not working, and it has never hurt me.

Q. You just judge altogether by your own experience?

A. Well, I know of other fishermen being out the same way.

5307 Q. There is a much better current now than there was before the opening of the canal?

A. More current, yes, sir.

Q. There is a much better current now than there was before the opening of the canal?

A. Yes, sir, there is more current.

Q. There is no time of the year in which there is no current?

A. Why, no.

Q. Except from back water?

A. Back water; sometimes there is a great deal more you know, than there is at other times.

Q. Now, do you mean more back-water or more current?

A. More current.

JAMES WATERS.

5308 Naples, Illinois, July 18, 1903.

BENJAMIN FRANKLIN ECKLES, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. Well, sir, my name is Benjamin Franklin Eckles; my occupation in my former life has been farming, and it is yet a little.

Q. Where do you live?

A. I live in the corporation of the town of Naples; have for about fifteen years; I used to farm before.

Q. How long have you lived upon the Illinois river?

A. Well, about fifteen years. Part of that fifteen years, four years, I have lived within eight feet of the bank of the river, and that is where I live now.

Q. How long have you lived in this vicinity and in the vicinity of the Illinois river?

A. Well, sir, I call it I lived in the vicinity ever since 1846. I just lived off a little from Naples, but I call it the vicinity of the river.

5309 Q. Have you fished and hunted upon the Illinois river since you have lived in its vicinity?

A. I have never fished any only with a pole, hook and line; I have done a good deal of that.

Q. What was the condition of the Illinois river water, before the opening of the drainage canal?

A. What do you mean, clearness?

Q. Yes, color?

A. Well, I don't know as I could tell you what the condition was. Whenever we had a little rain it was muddy and whenever we had a long dry spell it was clear.

Q. Was there a moss or scum formed in it in low water?

A. Why, yes, there was considerable of that, and even grass; but that was years ago; I have seen grass grow green in the river, but that is a good while ago.

Q. Was there sometimes a smell to the water?

MR. JEFFRIES: Objected to as leading.

A. Yes, sir, there was a smell to the water in warm weather.

Q. Before the opening of the canal, in your fishing excursions, did you drink the water of the river?

A. Well, I don't think I did.

Q. Since the opening of the canal what has been the condition of the water?

A. Well, since the opening of the canal I pronounce the
5310 water clearer, purer, brighter and better, and use it
stronger for all the uses than I did before, a good deal. The last four years I lived on the river and I have used that river water a good deal for all purposes. In right warm weather I don't use it for drinking purposes, but cool weather I do.

Cool weather I use it for drinking purposes, cooking and everything.

Q. How many people in your family?

A. Just myself.

Q. Do you know of other people here who have used the river water since the opening of the canal?

A. Well, I don't know that I do; they have splendid pumps here and it would be more trouble to go down to the river and get the water, more trouble than it would be to pump it at the house.

Q. How deep are the sand pump wells here?

A. Well, they vary a little from twenty to thirty feet on an average mostly.

Q. And of course they are at various distances from the river?

A. Yes, sir.

Q. Have you ever suffered from any disease caused by the drinking of the river water?

MR. JEFFRIES: I object to the question, as the witness has not qualified to determine or to say whether any particular disease comes from drinking the water.

5311 A. Not that I know of, sir; I enjoy very good health for a man of my age.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How old are you?

A. I am 69 years old; going on 70.

Q. You are not a married man?

A. No, sir; I am a widower. I lived to be that old and never enjoyed married life but eight years; been single all my life except eight years.

Q. You do your own cooking?

A. Yes, sir.

Q. You never made fishing your business?

A. No, sir.

Q. You say they have a better current now than they did before the drainage canal was opened?

A. To my knowledge they do; I have crossed the river a good deal in boats, in skiffs, and they beat me down now a great deal worse than they did before.

BENJAMIN F. ECKLES.

5312 Continuation at Meredosia, Illinois,, July 18, 1903.

JOHN CHRISMAN WORKMAN, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd testified as follows:

Q. What is your name?

A. John Chrisman Workman.

Q. Where do you live, Mr. Workman?

A. I live in Meredosia, Morgan county, Illinois.

Q. How long have you lived here?

A. I have lived here eight years the 14th day of last February.

Q. What is your business?

A. I am a fisherman.

Q. How long have you been a fisherman?

A. Well, sir, I have been a fisherman about—I have been working at the business for about 20 years; that is, I haven't been a fisherman myself, but I have been on the river that long.

Q. What kind of a fisherman are you, a net fisherman or rod and line?

A. I am a net fisherman; net and seine.

5313 Q. Will you describe the condition of the Illinois river at this point before the opening of the drainage canal as to the color of the water, character of the water, stagnancy of the water and other characteristics of the water, such as you may have observed?

A. Well, as I said before, that is going to be a hard question to answer; sometimes it is muddy and sometimes it is clear, stagnant, and so on.

Q. Before the opening of the canal I wanted?

A. Well, that is about the best I could give it.

Q. Was there any green scum upon it?

MR. JEFFRIES: Objected to as leading.

A. Well, at times of the year there is green scum upon it. It comes from vegetation as much as anything else.

MR. JEFFRIES: Answer objected to because it is not responsive.

Q. Was there any odor to the water before the opening of the canal?

MR. JEFFRIES: Objected to as leading.

A. At certain times of the year it would smell bad along the river, the same as it does now; it will do that now; it does that along here now sometimes; it is bound to do that whenever the water gets low, more or less.

Q. Have you had low water here since the drainage canal was turned in, in 1900?

5314 A. Yes, sir; we had low water here two years ago; two years ago this fall that the water was so low; it seems to me it was either two or three years ago, the water got so low; that it dried up in those little lakes up here.

Q. That would be before the opening of the drainage canal?

A. That would be in the fall of 1900, wouldn't it?

Q. 1899, wouldn't?

A. This coming fall will be three years since we had low water.

Q. How low was the water then?

A. Well, I couldn't tell just how low it was then; you can tell that by going out on the bridge; they have got the books out here on the bridge. I have forgotten myself; I didn't know that I would ever need to know it.

Q. Do you know whether that was before or since the opening of the drainage canal, January 17th, 1900, that you had that low water?

A. No, I don't know.

Q. Have you observed any smell on the waters of the Illinois river since that low water that you speak of?

MR. JEFFRIES: Objected to as leading.

A. Why, just as I told you a while ago, you know; I told you it would be that way again whenever the water got low, and the water got down off the banks, it is bound to smell, that's all.

5315 Q. Have you had a low water since that low water that you spoke of?

A. No, sir.

Q. Since that low water that you spoke of have you observed any smell?

MR. JEFFRIES: Objected to as leading.

A. Well, of course there is a smell along the river here now; pretty bad, too; but on account of these mussels, though.

Q. I am not speaking about that or a dead horse; I am speaking about the water. You spoke of a smell before the drainage canal.

A. No, I don't think I have.

Q. What in you opinion has been the effect upon the quality of the water in the Illinois river at this point by the opening of the drainage canal in January 17th, 1900?

A. Well, I think it has a tendency to make the water purer, that is, you understand when the water is low; at this time of the year when the water is high, of course it don't do that, because it is bound to be muddy anyway when the water is high, but that is because it comes from the rains, whenever it is muddy, but as far as the canal is concerned, I think it has a tendency to purify the water at this point. That has always been my argument anyway.

5316 CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say you are a fisherman?

A. Yes, sir.

Q. Where did you say you lived?

A. I live right here in town.

Q. Do you live in a house or a boat?

A. I board at the hotel.

Q. Do you have a well or a cistern at your house?

A. We have a well at the hotel where I board. I don't pretend to have a house of my own.

Q. You are not a married man?

A. No, sir.

Q. How long did you say you have been fishing here?

A. I have been fishing ever since I came here, that has been about eight years.

Q. What is the difference between the water now and what it was before the canal was opened?

A. Well, as I told you a little while ago; that is a pretty hard question; it is pretty hard to remember back that far; at a certain time of the year the water is clear and at other times it is muddy.

Q. And that was true before the canal was opened?

A. Yes, sir.

5317 Q. You say the water smells now as well as it did before the canal was opened?

A. I didn't say it did now, I say it would when the water got down low.

Q. It isn't quite low enough yet?

A. No, sir.

Q. You don't know whether the water contains deleterious matter or not?

A. No, sir, I don't.

Q. Do you drink the water?

A. We don't drink it now; we do if it is necessary, but of course we take water with us when we get away.

his
JOHN CHRISTMAN X WORKMAN.
mark
F. S. B., Com'r.

5318 Meredosia, Illinois, July 18, 1903.

JULIAN L. GRAHAM, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Julian L. Graham.

Q. What is your business?

A. Fisherman.

Q. Where do you live, Mr. Graham?

A. Meredosia.

Q. How long have you been a fisherman?

A. About four years, that is engaged actively about four years and previous to that about fifteen.

Q. Married man?

A. Single.

Q. Will you describe the condition of the Illinois river before the opening of the drainage canal in 1900?

A. Yes, sir; in 1900 the water was very foul; very low, and navigation was almost impossible at times; since the opening of the canal it has been different.

Q. Was there any odor connected with the water?

A. At that time, yes, sir.

5319 Q. To what extent?

A. Well, it has been so low and it has been so foul that it was almost impossible to go in bathing.

Q. Was there any scum on the water

A. Yes, sir.

Q. To what extent?

A. Well, it has been to such an extent that a person could hardly pull through it at times with a boat, that is during August at this point here, the scum would get on the oars and pull them down.

Q. Since the opening of the canal have you had any low water?

A. No, sir.

Q. What has been the effect on the waters of the Illinois river at this point, of the opening of the drainage canal?

A. Best in the world.

Q. In what way?

A. For navigation, sanitary considerations and everything else in that line; there has been no smell since, if we have a rise after a couple of days it takes off the vegetable matter; a good stage of water for steamboats; couldn't have been better.

Q. Have you seen any scum on the water since the opening of the drainage canal?

MR. JEFFRIES: Objected to as leading.

A. No, sir.

5320 Q. What has been the effect upon the water itself?

A. Well I believe that it has purified it to a great extent, during both winter and summer.

Q. How has it affected your nets?

A. Not a particle.

Q. Before the opening of the canal, was there any scum upon the nets in these waters?

A. Yes, sir.

Q. How about since the opening of the canal?

A. Well, I don't know as I see very much difference, only it has been an improvement; I don't think I see as much slime and stuff accumulate on the web; I don't believe there are.

Q. About how many people are engaged in the fish business at this place ?

A. Well, I suppose there would be about eighty or ninety, somewhere along there; perhaps more.

Q. Since the opening of the canal do you know of any typhoid fever among the fishermen?

A. No, sir.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long did you say you have lived here in Meredosia?

A. Lived here since 1873; born and raised here.

5321 Q. Fished all that time?

A. No, sir; for the last four years I have been fishing; I have been in the fishing business 19 years; only the last four years I have been running a seine and fishing.

Q. You are not a married man, are you?

A. Single.

Q. Are you boarding at the same hotel that this other witness is boarding at?

A. Yes, sir.

Q. How far up the river do you fish?

A. Why, about six miles.

Q. How far down?

A. About six.

Q. There is a better current in the river now than there was before the canal was opened?

A. I think so.

Q. You never see any more green scum at all?

A. Not a particle; of course we see the green, but we don't see the scum.

Q. What is it?

A. The scum is the decayed vegetable matter, but the other is the buds of buck-brush floating down; but of course there is other trees, maples and stuff like that, that put it in the water; you get a good current, it passes it through.

5322 Q. That is simply your opinion of the matter?

A. Yes, sir.

Q. What fish thrives the best in this water?

A. Carp.

Q. Do you know what the carp feeds upon?

A. Yes, sir.

Q. State it?

A. They feed upon willow flies, gnats, and of course the parasites in the water and the grasses on the bank the scum and such stuff as that.

Q. And they feed on other things, too, don't they?

A. I suppose they do; I don't know.

Q. Well, we want you to give it?

A. Well, I have forgotten it.

Q. Do they eat manure?

A. I don't know.

Q. Don't you know that they do?

A. I don't know that they do; I think that is their principal food, though.

Q. What kind of manure, all kinds?

A. Any kind and all kinds.

RE-DIRECT EXAMINATION, by Mr. Todd.

Q. Any other fish that thrive here besides carp?

A. Yes, sir.

5323 Q. That flourish here?

A. Yes, sir. Well, the carp of course is the principal fish that thrive. Buffalo thrive, but they can't very well do it; the carp is the only fish that flourish, and the only fish from a financial standpoint, for the fishermen. The others doesn't amount to a continental from a financial standpoint.

Q. The carp is the billy-goat of the water is it?

A. Yes, sir.

JULIAN L. GRAHAM.

5324 Meredosia, Ill., July 18, 1903.

GEORGE S. LEWIS, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows?

Q. What is your name?

A. George S. Lewis.

Q. What is your business?

A. Hotel man.

Q. Where do you live?

A. Up on Main street in Meredosia.

Q. How long have you lived here?

A. Six years last March.

Q. Have you been on the Illinois river since you have been living here?

A. Yes, sir; spent a good deal of my time on the river.

Q. Did you know the character and condition of the water before the opening of the drainage canal in the Illinois river?

A. I was here during the low water; the lowest water we had, I was fishing a good deal that year. There was a good deal of bass fishing next to the bridge here.

5325 Q. When was that?

A. That was 1898 or 1899, I don't know which.

Q. What was the appearance and character of the Illinois river water before the drainage canal was opened?

A. The water was low here and the current was dead; we didn't seem to have much current during the right low water.

Q. Was there any scum on the water?

A. Well I didn't notice—next to the bank there was a scum and it seemed kind of stagnant.

Q. What effect has the opening of the drainage canal had on the water of the Illinois river at this point in your judgment?

A. Well it has made the water clear, and it has made it lower temperature, the water is cooler. I noticed it more in my fish that I use here. My fish are better than they were before. I use a good many fish at the hotel. I find my fish are a good deal better quality than they were before this water was turned in here.

Q. How about the quality of the water itself?

A. Well, you mean the pureness of it?

Q. Yes?

A. Well I judge the water is purer now than it was before this water was turned in; if it wasn't it wouldn't be so much cooler than it is; I noticed it more in the temperature of the water than anything else.

5326 Q. Has there been any typhoid fever here since the opening of the canal that you have heard of?

A. No, I have not heard of any; I don't pay no attention to things of that kind; we have had no sickness of the kind at our place.

Q. Has there been any smell on the water since the opening of the canal?

A. No, I haven't noticed any.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. You say you are not a fisherman?

A. Only a line fisherman; I am on the river a good deal and do a good deal of hook and line fishing.

Q. You say you are in the hotel business?

A. Yes sir.

Q. How long have you been in that business?

A. Six years; six years last March.

Q. Have you a well or cistern?

A. We have a drove well.

Q. And you use the water from that well?

A. Yes sir.

Q. You don't use the water of the Illinois river here?

5327 A. No sir, we never use it. Our waters here are all filtered through the sand. Our wells run all the way from 24 to 36 feet; that far they are bored. They use that water and don't use the river water.

Q. What is the reputation of this river water for drinking and domestic purposes?

A. Well, I don't know as they ever use it here for domestic purposes; not when they have the other water, anyway.

Q. You don't know whether it contains any deleterious substances or not?

A. No sir, I do not.

Q. The fish that were caught here before the canal was opened, were sold on the open market were they not?

A. Yes sir.

Q. They had never been condemned by the State Board of Health?

A. Not that I know of; I couldn't say as to that.

Q. What is the difference between the flow of the water now and what it was prior to the opening of the Chicago drainage canal?

A. Why there is more current in the river.

Q. Considerably more?

A. Yes, considerably more current.

Q. Now you spoke of the water being more clear now than it was before it was opened; what you mean by that was that it had no scum on it, while before it did have?

5328 A. There was some scum on it on account of the water being low and stagnant.

Q. Then remove that scum and the water would be clear, wouldn't it?

A. I don't know that the water was clearer underneath; I never paid much attention to that.

Q. At that time, clearer than it is now, wasn't it?

A. Well I suppose it was; it was more stagnant then; there wasn't much current. All I was going by, it seems purer now than then; I noticed the fish more than anything else.

GEO. S. LEWIS.

5329 Meredosia, Illinois, July 18, 1903.

WILLIAM HAUSER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. William Hauser.

Q. Where do you live Mr. Hauser?

A. Meredosia.

Q. What is your business?

A. Ferry; run this ferry sixteen or seventeen years.

Q. What kind of a ferry?

A. Cable ferry.

Q. That consists of a flatboat, a cable stretched from point to point, that you pull people across with?

A. Yes sir.

Q. You operate it yourself, do you?

A. Yes sir; I have a man that works with me, that helps me.

Q. Will you state the condition of the Illinois river before the opening of the drainage canal at this point?

A. Well before the canal was opened, of course different times, of the year, in the fall of the year that we had a 5330 right smart of stagnant water; but since the canal has come in here our water has been more pure than it was before. And in the fall of the year why lots of times we drink the water when it gets colder and I find that since the canal was in it is better to drink than it was before; I call it a kind of a grit, that makes it taste better than it did before.

Q. Before the canal was opened was there any green scum on the water?

A. Yes sir, especially in the fall of the year.

Q. Has that disappeared?

A. Yes sir.

Q. Have you known of any typhoid fever here since the opening of the canal?

A. No sir. Now before this canal, about three years before this canal was opened up, I took a scythe and mowed the weeds across the river so I could get through with my ferryboat; moss and weeds; some call them water grass; I mowed it with a scythe to get it out of the way so I could get through them all right. Since the canal has been through here I haven't had any trouble with them; I could get through it all right.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. How long have you lived here?

A. I was born and raised here, about 47 years.

5331 Q. When you spoke of mowing the weeds, that was an exceedingly dry season, was it not?

A. It was in the fall of the year when the water would be down. I have seen it here year after year, right along.

Q. But you didn't mow it for two or three years prior to the opening of the canal?

A. I haven't mowed it in the last five years.

Q. In fact you haven't mowed it in the last seven years, you said a moment ago?

A. I am positive I haven't mowed it in the last five years. It might have been six years or seven, but it has been five years anyhow, since I mowed it.

Q. There is more current in the channel now?

A. Oh yes, we have got more current now than we had before.

Q. How much more?

A. A whole lot more current.

WM. HAUSER.

5332 Meredosia, Ill., July 18, 1903.

REV. R. G. LINKER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. R. G. Linker.

Q. What is your business?

A. Minister of the Gospel.

Q. Connected with what church?

A. Evangelical Lutheran.

Q. How long have you lived in Meredosia?

A. I have been a preacher in Meredosia, now six years, lived here five years.

Q. How large is your congregation?

A. Well I suppose we have 65 members; I have two congregations; I have one out in the country besides the one here.

Q. You lived here before the opening of the drainage canal, did you not?

A. Yes sir.

Q. Have you had occasion to observe the water of the Illinois river before and since the opening of the drainage canal?

A. Yes sir, I have.

5333 Q. What was the character of the water of the Illinois river before the water of Lake Michigan was turned into the Illinois river.

A. Well, that is a question I can hardly positively answer; because while I live here I have not watched it, although I might say this, that when the river was low, the water didn't seem to be as good as now.

Q. Did you notice any odor from the water before the opening of the canal?

A. Well as far as that is concerned, I have observed some odor, but I wouldn't be positive about it that it came from the river, because I know when the water was low, before the canal was opened I have observed an odor or rather an offensive smell.

Q. What has been the effect of the opening of the canal in your judgment, upon the water at this point?

A. Well my judgment—that is my opinion?

Q. Yes?

A. That the water has been further better.

Q. Has there been any typhoid fever among the members of your congregation in the last three years?

A. Not that I know of.

Q. Has any body connected with your congregation died with typhoid fever in the last three years?

5334 A. No sir.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. The people in Meredosia drink the water from their wells and cisterns, do they not?

A. We drink water from what we call drive wells, that is, we drive a pipe down until we get to quicksand, to the water, and that is the water we drink.

Q. They don't use the water of the Illinois river for domestic and drinking purposes?

A. Why no.

Q. When you say the water is better now than it was before the canal was opened, you make that statement simply as your judgment from the appearance of the water alone?

A. Yes sir; I make it from observation, from the appearance.

Q. You don't know whether the sewage from Chicago affects the water here or not?

A. In what respect?

Q. Well, in the way of rendering it unwholesome?

A. I don't know anything about that.

Q. You don't know whether the water is more unwholesome now than it was before the opening of the canal, from a sanitary standpoint?

5335 A. Well that, you know we can't tell; we only know by observation that the water is clearer.

Q. Did you ever remove any of the scum from this water?

A. I have never been on the river, never had any occasion to.

Q. You have never been on the river?

A. I have crossed the river on the ferry.

Q. Did you observe the water underneath the scum?

A. No.

Q. You don't know whether it was clear or not?

A. No, because I never examined it; I couldn't give you any testimony on that because I never examined it.

R. G. LINKER.

5336 Meredosia, Illinois, July 18th, 1903.

A. J. LESLIE, called as a witness in behaf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. A. J. Leslie.

Q. What is your business?

A. Dealer in grain.

Q. Where do you live?

A. In Meredosia.

Q. How long have you lived here?

A. Nearly thirty years.

Q. How near to the river do you do business?

A. Here 100 yards.

Q. Have you been on the river here during the last five or ten years?

A. Yes, sir.

Q. How much?

A. Why, I am down to the river or on the river every day.

Q. What was the condition of the river before the opening of the drainage canal?

A. Why, in the summer time in low water there was a green scum all over it; a sluggish current; I suppose you

5337 would call it a green scum.

Q. Any odor to the river?

A. There was, yes.

Q. What kind?

A. Well, that was something that was peculiar to stagnant water; I don't know how you would explain it.

Q. What has been the effect of the opening of the drainage canal on the waters of the Illinois river at this point?

A. Well, I have never noticed any more of that green scum; the water appears to be clearer and purer and a better current, keeps it clearer and the scum don't accumulate.

Q. Has it the same odor that it had before the opening of the drainage canal?

A. I haven't noticed any odor particularly for two or three years.

Q. Have you known of any typhoid fever being in Meredosia since the opening of the drainage canal?

A. I have not.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say there was a green scum formed on the water prior to the opening of the canal?

A. Yes, sir.

5338 Q. Now, after that scum was removed the water would be clear?

A. As to the scum?

Q. Underneath the scum it was clear?

A. No, not so very, on account I suppose it was more stagnant and not as much current; naturally the water is not as clear.

Q. Are you a man of family?

A. Yes, sir.

Q. You live here in Meredosia?

A. Yes, sir.

Q. You have a pump or a well at your house?

A. Pump.

Q. You use the water from that pump for domestic and drinking purposes?

A. Yes, sir.

Q. You don't use the water from the Illinois river for domestic and drinking purposes?

A. No.

Q. They cut the ice that they get in the winter time from Meredosia lake, don't they?

A. Sometimes, and sometimes from the river.

Q. Mostly from the lake?

A. Yes, sir.

5339 Q. You don't know whether the sewage from Chicago comes down here or not?

A. No, sir, I don't know anything about that.

Q. You don't drink the water from the river?

A. No, sir.

Q. The people generally around here don't drink it, do they?

A. No.

A. J. LESLIE.

5340

Meredosia, Illinois, July 18, 1903.

F. A. NEVILLE, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. F. A. Neville.

Q. What is your business?

A. I practice medicine, physician and surgeon.

Q. How long have you been practicing medicine in Meredosia?

A. Sixteen years.

Q. During the time that you have practiced medicine here, have you had occasion to become acquainted with the Illinois river?

A. Yes, sir, some little.

Q. What was the character of the water of the Illinois river prior to the opening of the drainage canal?

A. Well, it would depend a good deal on the season of the year. In the fall the water would become rather stagnant and green of a pea green color and a good deal of organic material in the water and floating.

Q. Was there any current in the water to speak of?

A. Very little.

5341 Q. What in your opinion has been the effect of the opening of the drainage canal and the turning of the water into the Illinois river?

A. I believe it has improved the character of the water.

Q. In what way?

A. Well, the water is more clear and there is less organic material in the water; at least I would judge so from appearances.

Q. In your practice, doctor, does it extend among the fishermen as well as other people?

A. Yes, sir.

Q. About how many men are engaged here in the fishing industry?

A. Well, that is pretty hard to state, but I can say between fifty and a hundred; I couldn't state just exactly the number. There is some over fifty, and I think probably less than 100.

Q. Have you had any typhoid fever cases during the last three years among the fishermen?

A. No, sir.

Q. How many cases of typhoid fever have you had in the last three years, in Meredosia?

A. Not to exceed a half a dozen.

Q. Was any of those cases attributed to the waters of the Illinois river?

5342 MR. JEFFRIES: I object to the question because the witness has not qualified as competent to pass on that question.

A. No, sir.

Q. The cases which you treated, what was done with the excreta?

MR. JEFFRIES: Objected to as immaterial.

A. The excreta was disinfected, and some of it dumped in sink basins and others dug holes; at least that was what I ordered done; I don't know whether the orders were carried out or not.

Q. What is the population of Meredosia?

A. About eight hundred.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You don't use the water of the Illinois river for domestic and drinking purposes, do you?

A. No, sir.

Q. And the people in town don't use it?

A. No, sir.

Q. It is not used for that purpose among any of these patients who were afflicted with typhoid fever that you treated?

A. No, sir, I believe not.

Q. So far as you know?

A. So far as I know, it was not.

5343 Q. When you say the water is clearer, you don't make that statement on any analysis that you have made of the water, but simply from the appearance?

A. That's all.

Q. Then as I understand it you know nothing about the water other than from appearance and the fact that there is a stronger current and a larger volume of water than there was prior to the opening of the canal?

A. Yes, sir, that is all.

F. A. NEVILLE, M. D.

5344 Meredosia, Illinois, July 18, 1903.

S. D. ALLEN, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. S. D. Allen.

Q. Where do you live, Mr. Allen?

A. I live here in Meredosia.

Q. How long have you lived here?

A. About twenty-five years.

Q. What is your business?

A. Pumping here for the Wabash Railway Company.

Q. Pumping what?

A. Water.

Q. Into what?

A. Into the tank.

Q. From where do you pump the water?

A. Out of the Illinois river.

Q. What did you do before you went into the employ of the Wabash Railroad pumping water?

A. I was working here on the bridge before I went pumping water.

Q. When did you begin pumping water, how long ago?

A. About 1896, I think it was.

5345 Q. Before that time how long had you been on the bridge?

A. I had been there about four years.

Q. You are pretty familiar with the Illinois river water then, are you?

A. I suppose I am; I lived here about 25 years and lived about the river all the time.

Q. What was the condition of the Illinois river before the opening of the drainage canal?

A. You mean the water?

Q. The water?

A. At low water it was pretty filthy in my estimation.

Q. What was its appearance?

A. Well, do you want to know what condition the water was in?

Q. Yes.

A. Well, there was a green scum on the river, and there was grass growed all up in the water here and a sediment in the river, that is it went down and left all the filth on the ground outside; that is the water went down and left it, and it was a pretty bad stench here, as soon as the water went down and left it.

Q. How did the water act on the boilers?

A. Well, it was pretty bad on the boilers before the drainage canal.

Q. Well, describe how it acted?

5346 A. Well, the water foamed, for one thing; you understand that. You people, I guess, the foaming business.

Q. What effect has the water of the drainage canal had on the Illinois river at this point?

A. You mean what effect it has had on the health of people?

Q. On the water?

A. It has been a benefit.

Q. In what way?

A. Why, the water has been purer; we have used it for drinking purposes on the bridge right along when it was cold enough to use it.

Q. Is there any odor to it?

A. Not any that I could discern.

Q. Have you seen any of that scum on it since the opening of the canal?

A. No, sir.

Q. What effect has it had on the water for steam making purposes?

A. Well, it has been better.

Q. In what way?

A. Well, it hasn't foamed and it hasn't lined the boiler as bad.

5347 Q. Have you drank the waters of the Illinois river since the opening of the canal?

A. Yes, sir.

Q. How often?

A. Why, we drink it all the time there on the bridge when it is cool enough to drink, every day.

Q. How many of you are there on the bridge?

A. Well, there are three of us; that is I help them part of the time; I ain't there steady all the time, but then I help them part of the time.

Q. Has the drinking of the water of the Illinois river made any of you people sick that you know of?

A. Not that I know of.

Q. Did you ever drink the water before the opening of the canal?

A. Yes, sir.

Q. How does the water since the opening of the canal compare with the water before the opening for drinking purposes?

A. Well, it is better.

Q. In what way?

A. Why, it hasn't got that gas or stench to it that it had before; it is more clear and it is purer, I think.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Are you a man of family?

5348 A. Yes sir.

Q. You live here at Meredosia?

A. I do.

Q. Have you got a well or a pump at your home?

A. I have got a pump, yes sir.

Q. You use the water from the pump for domestic and drinking purposes at home, do you?

A. Yes sir.

Q. You don't use the water from the Illinois river?

A. No sir.

Q. You say the water from the river when put into the boiler foamed?

A. Yes sir.

Q. You don't know that was caused by the water, might it not have been from some other cause?

A. I don't know hardly any other cause it could have been; it never did that before.

Q. How often did it do that?

A. Well, quite frequently before the canal was turned in.

Q. There is a much stronger current now than there was?

A. Yes sir.

Q. In fact before there was no current?

A. Oh well, there was some current of course when the
river was any stage; of course before the canal there
5349 wasn't much current, not near so much as there is now.

Q. You don't know whether the water contains deleterious matter now or not, do you?

A. Well I ain't no expert; I don't know everything: I ain't no analyzer or anything of that kind; I ain't done any of that kind of business.

Q. On account of the increased volume of water and better current, you think the water is better?

A. Yes sir.

Q. Does the water ever foam in your boilers now?

A. No sir.

Q. It never does?

A. No sir.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Is that the only reason you think it is better, because there is a better channel, a better current?

A. Why no, I think it is because the water of Lake Michigan is purer than the water in this river.

RE-CROSS-EXAMINATION,
By Mr. Jeffries.

Q. You don't know what effect the Chicago sewage has on the water though?

5350 A. Well that is just as I told you before; I ain't no analyzer or anything of that kind; I don't know anything about that business.

Q. You are not considering that at all?

A. I do know one thing, that is I believe,—well I know it that the water is better here now than it was before.

S. D. ALLEN.

5351 Meredosia, Illinois, July 18, 1903.

J. P. BAUR,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. J. P. Baur.

Q. What is your business?

A. Well sir, I am a fish culturist in the employ of the United States Fish Commission; but I am at present in charge of the station at this point, of the United States Fish Commission, at Meredosia.

Q. How long have you been employed here in that position?

A. About fourteen years.

Q. What are the duties of that position?

A. Well I look after the collection and loading of the United States Fish Commission cars; that practically would be all. I have charge of the crew here, that is all.

Q. How many men compose the crew?

A. Seven not including myself.

Q. How long have you occupied your present position?

A. Twenty years; that is I have been in the employ of the Commission for twenty years; fourteen years at this town.

5352 Q. Did your duties in your present employment, give you an opportunity to become acquainted with the Illinois river?

A. Yes sir.

Q. To what extent?

A. Up to five or six years ago. I don't know just which, I had charge of the steamer Lotus in making the collection of fish for distribution, for the United States Fish Commission; this boat took its place in the work, but I never had anything to do with this boat (The Illinois).

Q. How much of the river did you become acquainted with?

A. From La Salle to Grafton.

Q. When did you cease your connection with the Lotus and become permanently located at this point?

A. About five or six years ago; I can't remember just now; I would know, but I have my book at home.

Q. How many varieties of fish are found in the Illinois river?

A. Well I couldn't answer that question; I don't believe any man could answer that question but some man who has made it a study all his life.

Q. What variety of fish do you handle for the United States Government?

A. We handle black bass, croppie, channel catfish and
5353 bream. Now those are the fish that we handle for distribution; there is lots of other fish that we handle as a collection, put up in formalin and send to Washington.

Q. What was the condition of the Illinois river before the opening of the drainage canal, between La Salle and Grafton, as you know it?

A. During the summer months the river would get very low and it was a very narrow stream and the water was what I would call bad condition, so much so that you could not drink it even by the use of ice in the water; at least I couldn't.

Q. What was the condition of the water from Peoria to Copperas Creek Dam?

A. Well from Copperas Creek dam for about five miles above it I have gone up that stream in the steamer Lotus and turned up sediment and dead fish—well on several different occasions, and there was a terrible stench and a man could hardly stand the smell, which I supposed of course was from the distilleries or I believe that it was the filth of the distilleries at Pekin and Peoria.

MR. JEFFRIES: I move to strike out that part of the witness' answer in which he undertakes to give the cause of the condition of the water in the river, for the reason that it is not responsive to the question, and for the reason that the witness has not properly qualified to give an opinion on that subject.

5354 Q. Did you know, as a matter of fact that there were distilleries located at Peoria and Pekin, and a glucose sugar refinery at Peoria, which emptied their sewage into the Illinois river?

MR. JEFFRIES: Objected to as immaterial.

A. I knew that there was distilleries at Peoria and Pekin, but I did not know that there was a glucose factory at Pekin or Peoria.

Q. What effect did the water in the Illinois river at low stages, have upon the fish?

A. Well it would only affect fish so far as I know, in ponds; I don't know that it affected the fish below these dams any at all, only during the winter season when the ice was over the water, and after the ice had broken up we would find quite a number of dead fish.

Q. These ponds you speak of are fed by the Illinois river, are they not?

A. When the water is high enough to go back into these ponds.

Q. Did you ever notice any fish dead in these ponds?

A. Thousands of them.

Q. And what became of those fish?

A. They were eaten by birds, the different kinds of waterfowl that we have around this country.

5355 Q. A rise in the river at those times would reach the ponds would it not?

A. If the rise was enough to go over the banks, it would.

Q. Do you remember whether it ever did or not?

A. Oh I remember several times that the water would go up and fill them up and keep the fish from dying.

Q. What would become of the dead fish that would be in those ponds at the time of these rises?

A. Most of these fish that were left in these drying pools are eaten by water fowls before the pond goes dry, and the balance of course would lie there and dry up. If they were large enough, it would create a bad odor around there, and if they were small you would hardly know that there had been any fish at all.

Q. What other places along the Illinois river did you observe similar conditions as existed from Copperas Creek to Peoria?

A. During the winter time I have noticed it at La Grange Locks.

Q. What was the condition of the water above Peoria as compared with that below Peoria during those times?

A. Well during the summer time the water above Peoria—well I couldn't tell you anything about that, above Peoria, because I wasn't very familiar with the water above Peoria, because I was only above there several times and I couldn't
5356 tell you much about that part of the river.

Q. What was the condition at La Grange Lock prior to the opening of the canal?

A. I don't think there was any—that I know of any complaint having been made about any stench around La Grange locks, I never heard of any; I don't know of any. One thing though I may say in favor of it is, that is that the government dredges keep the dam dredged out above the lock.

Q. What was the condition of the water at this point prior to the opening of the drainage canal?

A. During the summer, from the 15th of June to the 15th of August; it was nearly all the time a green scum on the water.

Q. Was there any current in the river at this point?

A. Yes, we always had a current in the river; the channel would perhaps not be over 75 yards wide, and vegetation would grow for 100 yards from the channel bank to the east, to Meredosia.

Q. Would there be any smell emanating from the water at that stage?

A. Well, yes, there would be a smell but I don't know whether you could lay it to the water or to the fish; this is a great point along here for the fishermen to throw off the offal of the fish and it might have been that.

5357 Q. Is that offal thrown into the river at this point?

A. Yes sir.

Q. What has been the effect upon the Illinois river, of the turning of the water of Lake Michigan into the Illinois river, since January, 1900?

A. The water is clearer and we have a three foot, high stage of water from low water mark. During low water, I guess it would have to mean that because in high water we have it very high.

Q. What other effects did you notice?

A. Well not any more than I would drink the water now in the Illinois river today if it had ice in it; I wouldn't have done so previous to the entering of the Chicago river unless it was absolutely necessary to do so.

Q. How about the conditions above the Copperas Creek dam?

A. I don't know anything about that since the canal has been turned in.

Q. Have you observed any green scum upon the water since the drainage canal was turned in?

A. I have noticed a green pod that floats on the water; I don't know the name of it, but it isn't a scum, it is a green pod; it might be taken for a scum in looking at it from a distance, but I know that it is a pod, I don't know what the name of it is.

Q. Pod from what?

5358 A. Why it seems to come from some tree or perhaps grows right in the water; I don't know.

Q. What is your opinion as to whether the water of the Illinois river has been injured or benefited by the opening of the drainage canal at this point?

MR. JEFFRIES: Objected to.

A. In my opinion it has been greatly benefited.

MR. JEFFRIES: The witness has not been qualified to express an opinion.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say these dead fish are found in the lakes and ponds?

A. During the hottest part of the summer.

Q. How about it in the winter time?

A. In the winter time they freeze to the bottom if the ponds are low enough in the summer time for the fish to die in.

Q. If it happens that they are not low enough to freeze to the bottom, these ponds freeze over in the winter time?

A. Yes, just owing to the season we have.

Q. Now, in the spring when the river breaks up, these ponds also break up don't they, by the spring floods?

A. No sir.

5359 Q. The ice doesn't break in the floods?

A. The ice in the ponds does not break up for a considerable time after the ice in the river breaks up, unless the water gets over into these ponds from the river and then it would take several days before the ice would break loose from the bottom.

Q. Now when the ponds don't freeze to the bottom they generally break up with the river?

A. No sir, they don't break up with the river then, from the fact that they will freeze to the bottom along the edges, and perhaps in the center it would lack a foot or two of being frozen to the bottom.

Q. Did the ice in the river kill the fish every winter?

A. No sir, only during a very low stage, and when the ice is very heavy.

Q. And only behind these dams?

A. It seems to be behind the dams, yes sir.

Q. You live here in Meredosia?

A. Yes sir.

Q. Man of family?

A. Yes sir.

Q. You have a pump or well at your house?

A. Yes sir.

Q. And use water for domestic and drinking purposes from the well?

5360 A. Yes sir

Q. The carp is the most bountiful fish in the Illinois river, isn't it?

A. Yes sir.

Q. When you say that the water in the Illniois river is clearer than it was before the Chicago drainage canal was opened, you give that as your opinion, simply from the appearance of the water?

A. Yes from the water being nearly perfectly clear nearly all the time during a fair stage of water.

Q. You don't know that it does or does not contain deleterious matter?

A. No sir.

Q. You don't know whether the sewage from Chicago gets here or not?

A. No I don't know only from what I have read about it and what my opinion would be about it; I don't know it positively.

Q. You are not an expert on that?

A. No sir.

J. R. BAUR.

ADJOURNED until Monday morning, July 20, 1903, at 8:00 A. M.. at La Grange, Illinois.

5361 La Grange Lock, Ill., July 20, 1903.

8:00 A. M.,

Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

JOHN D. KERR,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation.

A. John D. Kerr; Superintendent of La Grange Lock; Illinois river; Versailles, Illinois, is our postoffice. Rural Route No. 1.

Q. How long have you been superintendent of the Lock at LaGrange?

A. Twenty-one years in September.

Q. When was LaGrange Lock built, completed?

A. Well I can't remember the date when.

Q. How much of that time have you been superintendent of the lock?

A. The full time, sir.

Q. How far is La Grange Lock from Kampsville Lock?

A. It is called fifty miles; I don't know by actual measurement.

5362 Q. How far from Meredosia?

A. Six miles is what they call it; these are not actual measurements, gentlemen.

Q. How far is La Grange lock from Beardstown?

A. Twelve miles, or eleven miles.

Q. How far from Browning?

A. I think they call it twelve miles from Browning to Beardstown; I won't be positive, that would be 24 miles from here to Browning; I shouldn't think Browning was over ten miles from Beardstown; I wouldn't be positive about that because I haven't paid much attention to it.

Q. What is the width of La Grange dam between returns?

A. I think it is about 835 feet if I remember right, between the dam abutments, and the abutment on the other side of the river.

Q. Since the opening of the drainage canal how much has the water at La Grange dam been raised in the Illinois river?

A. Well to the best of my knowledge, to the best of my judgment I would say four feet; I couldn't tell you exactly.

Q. At what point is it four feet between the abutments of the dam?

A. On the gauges at the lock; that is guess work though, sir.

Q. Is that amount substantially correct?

A. I should think so.

5363 Q. How many gauges on the locks at La Grange?

A. Two, one above and one below.

Q. What is the difference in the readings of the two gauges?

A. It depends altogether on the stage of the water, sir.

Q. When the water falls over the dam and it is lower below the dam than above, what is the general difference between the upper and lower gauge?

A. Well it depends on the stage of water; at the present time it is 2.8; that is the difference in the reading of the gauges.

Q. Do you mean by that two feet and eight tenths?

A. Yes sir.

Q. Were you familiar with the condition of the water in the Illinois river above and below La Grange dam prior to January, 1900?

A. Yes sir.

Q. What was its condition?

A. Well, we used it for drinking purposes and around the house at that time before the drainage was put in and before the dam was built and we used it for all purposes there for two or three years; we had no other water when the operations first commenced, we had a dry-well then and we didn't think it was the best of water then and we used the river water to drink at that time. 5364

Q. What was its condition as to stagnation?

A. Well, I don't know as there is any—anything any different from any other river I was ever on; of course this river wasn't as big current as there is in some rivers, and it was not as fresh as in other rivers at other times.

Q. Was there a green growth or scum upon the top of the water in low water?

A. Yes sir; what you call water-clover on the river; it growed there. It was just like a regular clover a little three leaf arrangement that grows right on the water; in low water it would be twenty-feet wide, sometimes; and sometimes more.

Q. In times of low water what was the condition of the water as to clearness?

A. Well, it was reasonably clear; it was clear—You could see, I should safely say, a foot or a foot and a half at the dam; you could see the timbers down below.

Q. Since the opening of the drainage canal, what has been the condition of the current in the river?

A. Well the current has been a little over half faster, I should judge. I haven't taken no observations of it, but I should judge that from the appearance of it.

Q. What has become of this clover growth on the river; does it occur now?

5365 MR. JEFFRIES: Objected to as leading.

A. No sir, I haven't seen it.

Q. Have you wells or cisterns at La Grange now and since the opening of the drainage canal?

A. Yes sir.

Q. Do you drink the water of the river since you have had the wells and cisterns?

A. Well no sir; I don't.

Q. What is the condition of the water here since the opening of the drainage canal as to clearness?

A. Well pretty near as clear as it was before, sir.

Q. At times of low water?

A. At times of low water; it has never been real clear since that I have seen it.

Q. Did you observe in the water before the opening of the drainage canal at this point any odor?

MR. JEFFRIES: Objected to as leading.

Q. Or smell?

A. No sir, that is unless it was caused by the drift accumlating; the drift accumulated here one year clear across the river; we had ten acres of it. Dead animals and fish would get in there and they would smell of course; dead fish and things, but we got them out; but as long as they were there we had a very disagreeable odor, but since we got them out; it ain't 5366 there; that was caused by dead animals and things that would be in amongst the drift; as soon as the drift would be removed and the river cleared out, it would be all right; we wouldn't smell it any more.

Q. Since the opening of the drainage canal have you noticed any odor in the water?

A. Yes sir.

Q. Where do you discover it?

A. Anywhere around the locks; when the water was first turned in; it was very disagreeable here for eight or ten days; you could hardly stand it; and in damp weather now you can smell it very distinctly; the wind blowing it just right blows over to my house and I can smell it.

Q. Is that from the open river or from the water in the locks?

MR. JEFFRIES: Objected to as leading.

A. Well I think the most of it is caused where the water flows over the dam, stirs it and the wind blows it; I think that is where most of it comes from.

Q. When the water stands in the locks and the locks are consequently not flushed for some time, does an odor arise from that water?

MR. JEFFRIES: Objected to as leading.

A. Well yes sir, to a certain extent; it forms a kind of an oily substance on the top, and when you open the valve
5367 and the water runs out and stirs it up you can notice it
very distinctly.

Q. Is it different in that respect now, as to the time before the opening of the canal?

A. Yes sir.

Q. What is the condition of the ice taken at this point?

A. Why we use it sir; we fill our ice house right out of the lock; we use it right along.

Q. Is it different in any respect from the appearance of it before the opening of the canal?

A. I don't think there is sir; I have only noticed one bad piece of ice; it had a little streak of something in it; I didn't know what it was and throwed it away, but I have been advised by a physician not to put the ice in the water; put the ice in a vessel and then—put the water in a vessel and then pack the ice around it; that was his adivce to me.

Q. What is the present stage of the river today, as to whether it is—well as compared with any time since the opening of the drainage canal?

A. Well, it is about low water now, very near low water since the drainage canal was put in; within six inches. The lower gauge is 13.70 and the upper one I think it was 16.80, I
think it was, I am pretty sure.

5368 Q. Do you know whether the zeros of the two gauges,
upper and lower are at the same level?

A. Yes sir, they were established that way sir. Our gauge reads from the lower mitre sill.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How long did you say you have lived here?

A. 21 years next September, sir.

Q. How long have you been in the employ of the government?

A. About 27 years.

Q. Ever since the dam and locks were built at this place?

A. I have been superintendent here; I was superintendent during the construction; I was removed here from Memphis, Tennessee I think it was 1872; I was formerly stationed there and then before on the Red River; I was on the Red river first.

Q. You say the water was clearer before the opening of the canal than since?

A. That is my judgment, sir; in fact I know it is.

Q. What is the stage of the water as compared with what it was before the canal was opened?

A. Well I couldn't tell you sir—

Q. Average stage?

A. About four feet; that would be my opinion.

Q. Do you know the depth of water that is flowing over
5369 the dam now?

A. Yes sir; two foot three.

Q. Assuming by that three tenths of a foot?

A. Yes sir, thirty-hundredths.

Q. And the dam is how wide?

A. About 835 feet; I wouldn't be positive about that.

Q. Now how does that compare with ordinary low stages of the water?

A. At low stages I had to keep one foot of water on the dam; I went out there and bored about an inch and a quarter hole, I think it was and set a three-inch board down upon it edge-ways to hold the water back; I never let it get lower than one foot of water on the dam, and if it would go to raise I would take off one of them to make the water run clear over the dam, what we call flash-boards. We have never had to put the flash-boards on since the sewage has been put in.

Q. Those flash-boards are used to hold the water back so that it would run one foot over the dam?

A. Yes sir; that is to make it one foot higher stage above the dam than it would be without. Well not quite that, because there would always be a few inches there.

Q. There has always been a good current since the canal was opened?

A. Yes sir—well I will take that back, when we had the high water in the Mississippi, it kind of slacked it up
5370 and then there wasn't so much current here, there was a current, but not like it was now.

Q. Aside from the water from the Mississippi though, there has always been a much better current?

A. Oh yes, I should think a great deal faster.

Q. Now you say before the opening of the canal the water would smell?

A. No sir, I didn't say that.

Q. It did not smell?

A. No sir.

Q. And since the opening of the canal there has been considerable odor?

A. Yes sir, at times, worse than others; right after the sewage was turned in it was very bad for a while and then it gradually wore off, or we got used to it, one or the other. It hasn't been so bad, but only when the damp, mucky weather comes you can smell it very distinctly.

Q. How is it in the summer time in low water?

A. It is the same in the summer time; we don't get as much of it. One reason I think is because we are using the lock all the time you know, and the water don't stand there. It keeps a going all the time, but whenever the water stays in the lock any length of time, then we can smell it very readily and it has this scum and oily substance; it is a scum like
5371 formerly was on the river; it is a oily substance; I have shown the gentlemen some of it down there that has formed since this boat came through.

Q. You stated a moment ago that when the wind was in the right direction this smell came from over the dam?

A. Well, that is only at times sir, when there is mucky weather.

Q. How is it in extreme warm weather?

A. It is about the same sir; at times you can smell it and then again you can't; it depends on the wind altogether—the direction of the wind; if the wind blows away from it then of course we wouldn't get it on this side of the river; but if the wind is on the shore we get it all.

Q. Do you have a pump or a well that you use at your residence?

A. I have a cistern; I have a well also, but I use altogether cistern water in my family.

Q. You don't use the water from the Illinois river?

A. No; I used water in the Illinois river before the sewage was turned in for several years; my cistern sprung a leak and I had to use the river water; but I haven't used the river water since the drainage was turned in, at all sir.

Q. Why don't you use it?

5372 A. Because I don't think it is healthy; at least I imagine it ain't: I don't know.

Q. How did your physician come to advise you to put the ice around the receptacle containing the water rather than in the water?

A. He was down here a week or ten days ago and it was when I found that bad cake of ice in the ice house and I talked to him and asked him about it, and he said I advise you not to drink that water and he told me to put the ice around the water in the receptacle and cool the water that way.

RE-DIRECT-EXAMINATION,

By Judge Johns.

Q. Who was the physician and where does he live that gave you this advise?

A. Dr. Bly, Beardstown, Illinois; Dr. Bly, Junior; I think his given name is Walter, I ain't certain.

Q. When you speak of the water being clearer before the opening of the drainage canal than after, do you mean at extreme low water?

MR. JEFFRIES: Objected to as leading and suggestive.

A. At all times except when a freshet.

Q. At which time, before or after the opening of the canal after a freshet, did the water clear most rapidly?

5373 A. Why it would clear out after a freshet in a few days; it would run out in a few days; in about seven days we always calculated to get the head waters of the Sangamon.

Q. Does it clear up more rapidly since the opening of the drainage canal than before?

A. No sir.

Q. Does it clear up about as rapidly after a freshet?

A. It doesn't clear up as clear as it did before; it never gets clear; it hasn't been clear since the drainage has been in, sir.

Q. How far is it from here to the mouth of the Sangamon river?

A. The Sangamon is about four miles; the Sangamon comes in right above Browning and has three or four outlets above Beardstown Bay, and a slough and a lot of places it comes in. We also have another creek here that gives us more water than that does; called Crooked Creek. I believe they call it on the map the Des Moines river, something like that.

Q. Crooked creek is on the west side?

A. Yes sir.

Q. The Sangamon river is on the east side?

A. Yes sir.

Q. How far from here to the mouth of Crooked Creek?

A. About six miles. Perhaps seven.

5374 Q. In a low stage, or an average stage of water in the Sangamon river, its mouth is above Browning, is it not?

A. The main mouth of it, yes sir; I think at a low stage of water, it is just about the foot of Hickory Island.

Q. How far is it from La Grange Lock to the main mouth of the Sangamon river?

A. I should judge it was 21 or 22 miles; I wouldn't be positive.

Q. When you say that you get the head waters of the Sangamon in seven days, do you mean that it takes seven days for the water—

A. Oh, no sir; I mean after the flood suspends itself here; it commences to fall here; commences to clear up after that time. We get a Sangamon raise here in 36 hours.

Q. Do you calculate that it takes 36 hours for the water in the Sangamon river to reach here?

MR. JEFFRIES: Objected to as leading.

A. Yes sir, that is what we figure on; somewhere around thirty or thirty-six hours, around there, we call it three days, that's what we figure on.

Q. Thirty-six hours is a day and a half is it not?

A. Well we call it a Sangamon raise, we say, well we will get rid of that in three days; that's the way we talk amongst ourselves here, about 36 hours is what it takes to get here.

5375 Q. What is your age Mr. Kerr?

A. Ffty-three years.

Q. When the Sangamon river or Crooked Creek raises, what is the effect upon the appearance of the water here as to clearness?

A. Crooked Creek will make the water yellow; the Sangamon will make it black.

JOHN D. KERR.

5376 La Grange Locks, Ill., July 20.

BENAJMIN COLE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. My name is Benjamin Cole.

Q. Where do you live?

A. I live at La Grange locks.

Q. How long have you been connected with the locks?

A. I commenced work at the locks here in 1882. That is when I first worked.

Q. What position do you occupy?

A. I do any kind of work; operating in care of canals and other work of navigation, I guess that will cover it.

Q. Were you acquainted with the Illinois river at this point before the opening of the drainage canal in 1900?

A. Yes sir.

Q. What was the character of the water and the river at this point before the opening of the drainage canal?

A. Well sir, we had a very slow current in this river before the canal was turned in and when the water would get
5377 low why of course it would get stagnant.

Q. How far does the La Grange lock back the water up?

A. Well sir, I couldn't say positively, but it was built with the calculation to back it fifty miles; the dam raises the water seven feet four.

THE COMMISSIONER: Is that seven feet four tenths of an inch or of a foot?

A. Of a foot.

Q. MR. TODD: In times of low stage of water, what was the character of the upper pool?

A. Above the dam?

Q. Above the dam?

A. Well sir, the lower the current gets the less water we would have and of course above the dam it would get stagnant; we would have very little current. I have seen it get so low that I would walk across the river on top of the dam, several times, and of course then you know, the river would naturally have a green scum on it; it would be the same as a lake. There would be very little current.

Q. Since the opening of the canal, in January, 1900, what has been the current at this point in comparison with what it was before?

A. Well sir, I have no way of telling only my judgment
5378 would be that we have almost twice the current above the dam that we had before.

Q. When the waters in the locks are not disturbed for a considerable period, what effects do you observe in the shape of odor to the waters here?

MR. JEFFRIES: Objected to as leading and suggestive.

A. Well sir, I never noticed any odor in the water here in the locks; of course when it ain't disturbed there used to be a green scum come in the water in the locks just the same; that is it would be just the same as it would be above the dam you know.

Q. Since the opening of the canal, have you observed the odor that comes from the locks when the water is not disturbed there for several days?

A. I have never noticed any odor in the water in the locks; it is the water that runs over the dam that I noticed the odor in.

Q. When did you notice the odor from the water running over the dam?

A. Well, it was soon after the canal water was turned in.

Q. At the present time do you notice odor in the locks when the water is undisturbed there for a period?

A. No sir, we never noticed anything of that kind only when the water was froze over close to the dam below and close above.

5379 Q. What kind of work do you perform around the lock?

A. Well sir, I do general work; just anything and everything; blacksmithing or carpenter work or anything there is to do; of course I have done submarine work.

Q. What is that?

A. That is going under the water in a diving apparatus.

Q. For what purpose?

A. For working on the valves, repairing.

Q. Did you go under the water before the opening of the canal?

A. Yes sir.

Q. Have you been in it since the opening of the canal?

A. Yes sir.

Q. What kind of an apparatus is it that you use?

A. Well sir, we have got an entire suit for diving purposes and an air-pump to pump the air, with a rubber hose that is fastened on the head.

Q. Can you see out of the apparatus?

A. A very little; you can see when you look straight up; when you look down you can't see anything.

Q. What do you see through?

A. Glass; it has a glass front.

Q. How does the clearness of the water at present compare with its clearness before the opening of the drainage canal?

A. Well it would compare very favorably now as to clearness.

5380 Q. What do you mean by that?

A. Well I think it is fully as clear now as it was before the canal was turned in, and at times clearer. I have seen the water here since the canal was turned in the clearest I have ever seen it.

Q. Have you observed any difference in the temperature of the water?

A. Well in my judgment I have; I would think the water was lots cooler now than it was before; I have seen it in the river when it wasn't fit for a man to go in bathing; but now it is most too cool.

Q. Have you known of any typhoid fever being in this neighborhood along the river, since the opening of the canal?

A. No sir, I haven't noticed any any closer than say two miles and a half and that is along the bluffs; not along the river.

Q. How about the ague and malaria here, do you have it?

A. Well sir, very little; I haven't noticed anybody have ague here for several years.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How long have you lived here?

A. Well sir, I have lived here steadily for sixteen years; I commenced work here in 1882.

5381 Q. Here at the dam, at the locks?

A. Well of course there was no dam in here when I first commenced work.

Q. How old are you?

A. I am 44 years old.

Q. You say you have noticed an odor arising from the river since the opening of the canal?

A. Yes sir.

Q. Have you noticed an odor arising from the river at the dam in the winter time when the water would be frozen up, and yet there would be an opening above and below the dam?

A. Yes sir; it never freezes up against, above and below the dam, but the tighter it gets the more odor we have.

Q. And that you have noticed ever since the opening of the canal?

A. Yes sir.

Q. Do the people around here drink the river water?

A. I couldn't say only for the government outfit here; they drink cistern water and well water.

Q. You don't drink the water from the river?

A. No sir, we don't have no occasion to drink it; we have well water and the well water, you know is colder.

Q. Do you notice an oily scum on the water now, in place of the green scum prior to the opening of the canal?

5382 A. No sir, I don't notice any oily scum on the water here.

Q. Well an oily scum forms here in the locks doesn't it?

A. Well the water gets foul around the locks if it ain't disturbed. In this season of the year there is lots of fishing, and there is more or less dead fish in the water. People throw in many fish that they don't take and it makes the water rather foul around the locks when it ain't disturbed.

Q. Now you noticed no odor on the water before the canal was opened?

A. No sir, I never noticed any.

Q. What is the difference between the current in the river now and what it was prior to January, 1900, when the canal was opened?

A. Well I have no way to tell exactly, but I should judge it was double the current here above the dam; it is from appearance.

Q. That is now and at all seasons of the year?

A . Yes sir.

BENJAMIN COLE.

5383 Continuation at Beardstown, Illinois, July 20, 1903.

G. W. BARNEYCASTLE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. G. W. Barneycastle.

Q. Where do you live Mr. Barneycastle?

A. In Beardstown.

Q. Mr. Barneycastle did you ever take samples of the Illinois river water at this point for the Sanitary District of Chicago, to be sent to the University of Chicago, Professor Jordan and to the Board of Health of the City of Chicago?

A. Yes sir, I did.

Q. What years did you take that water in?

A. Well if I had fetched my book with me—

Q. These cards show correctly, don't they? 1899 and 1900?

A. Yes sir; that looks like my handwriting.

Q. Where did you take the water from?

A. From the Burlington railroad bridge, right in the channel, right on the right hand side of the channel, right on the draw, right down below there; right in the channel where 5834 the water, I should judge would be about twelve feet deep at any time of the year.

Q. How often did you take the water?

A. Once a week.

Q. Did you take it any oftener than that at any one period?

A. No sir, once a week.

Q. How did you take the water?

A. Well, he sent me two glass bottles and I should judge they held a gallon apiece the bottles and I would fill them up and he sent me two little bottles to be packed in ice; I don't know how much they was, probably four ounce bottles; I filled them up and packed them in ice and sent them every time I sent the big bottles.

Q. How did you receive the bottles, which you filled?

A. By express.

Q. Did the bottles have the stoppers in them when they came?

A. Yes sir.

Q. What kind of stoppers?

A. Glass stoppers.

Q. When did you remove the stoppers?

A. Not until I went to fill the bottles.

Q. Just describe how you filled the bottles?

A. Well I would take the bottle and go down to the
5385 water and hold my hand over the top of the bottle until I would run the bottle down underneath, to keep from getting the surface water down there, and let it fill and then pull the bottle up.

Q. When would you put the cork in?

A. Right away as quick as I would get it out I would put the cork in.

Q. Did you rinse the bottles out before filling?

A. Yes sir.

Q. How did you do that?

A. Just run them down in the water and get some water in and shake them and pour it out.

Q. After you put the stopper in the bottles what did you do with the bottles?

A. I put them in the case they were shipped in and packed them with excelsior around them and put the lid right on the box.

Q. Did you do anything else to the bottle except put the cork in?

A. No sir, put a seal on them; sealed it up.

Q. Did you put anything on them besides the seal?

A. Put a piece of leather of some description over it; right over the top of the cork; then put a wire around and put the seal on.

5386 Q. Anything else that you attached to the bottle?

A. No sir, except the card where I shipped it to.

Q. Did you put the card on each sample that you collected?

A. Yes sir, put a card on each one that I shipped.

Q. On the card which you placed on the bottle, did you write the sample number, the date, the hour of taking, the place of taking, your own name, height of water, temperature of water, direction of wind; temperature of air, rain; such as are indicated upon the card which I show you of sample No. 1258?

A. And I always put the time of the last boat passing the draw too; yes sir, that's what I did.

Q. On the back of the card, were there printed instructions for collecting samples of waters similar to the instructions on the back of the card I last showed you?

A. I think it is the same; I haven't got my glasses with me: Yes sir, just the same I think.

Q. Did you attach one of these cards properly filled out in the manner mentioned in the last question, to each sample that you collected?

A. Yes sir, I did.

Q. After collecting the sample what did you do with it?

A. I took them to the Burlington Depot and when it was cold weather put them in the baggage room, so they
5387 wouldn't freeze and burst the bottles, and when it wasn't cold I set them outside until the express train came along and then the express man took them on the express car.

Q. What express company did you send them by?

A. The Adams; that is, I sent one bottle by the Adams, and one went over the B. & O. I believe that was the American Express Company if I ain't mistaken; I won't be sure about that; but they don't have the Adams Express on the B. & O.

Q. To whom did you send these samples?

A. Well I sent one to Dr. Palmer and one to Dr. Jordan, I believe.

Q. Did you send any to the Board of Health in Chicago?

A. Well, there was three samples and I sent two of them to the same man and one to the other.

Q. Two samples you sent to Chicago?

A. Two to Chicago and one to Dr. Palmer.

MR. TODD: Mr Commissioner I will ask to have sample No. 1258 card marked Sanitary District of Chicago Exhibit for identification No. 7.

Said card so marked by the Commissioner.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You say you live here in Beardstown?

A. Yes sir, I live in Beardstown.

5388 Q. When you put the bottle under the water to get these samples you held your hand over the mouth of the bottle until you got it submerged?

A. Yes sir, put my hand over the mouth of the bottle until I got it under the water; that was the instructions I received when I got the contract to collect the water.

Q. How many samples did you take each week?

A. One sample each week.

Q. That is, you took three samples at one time?

A. Yes sir, took three samples at one time; that is I sent the three bottles each week. Every Tuesday morning, sometime between the hour of seven o'clock in the morning and noon; whenever I would just get the time.

Q. How long would it be after the samples were taken before the shipment was made?

A. The same day, the express train went through here at noon every day and they went right off every day on the same train.

Q. When did you re-cork the bottles after you took them out of the water?

A. After I refilled them?

Q. Yes.

A. Right as quick as I could get them out; I had the cork 5389 right there and put it in.

Q. I understood you to say you rinsed the bottles?

A. Yes sir, then I filled them.

Q. Both the small and the large bottles?

A. Yes sir.

Q. And you sent the samples to Prof. Jordan?

A. Yes sir, one of them—no, two of the bottles I sent to Prof. Jordan and one to Dr. Palmer at Urbana.

Q. During that time was you out on the river every day?

A. Yes sir, every day.

G. W. BARNEYCASTLE.

5390 Beardstown, Illinois, July 20, 1903.

DR. GEORGE BLEY,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. George Bley; Beardstown, Illinois, physician.

Q. How long have you been a practicing physician?

A. 22 years.

Q. Of what school of medicine are you?

A. Regular.

Q. How long have you practiced medicine in Beardstown?

A. Twenty-two years.

Q. Have you during that time had a general practice among the people of this vicinity?

A. Yes sir.

Q. How large a town is Beardstown?

A. About 5,000.

Q. Has it a public water supply?

A. Yes sir.

Q. From what source is the water supply obtained?

5391 A. From a six or eight inch well driven ninety feet into the sand about ten or eleven blocks from the river in the back part of town.

Q. Have you been in a general way familiar with the condition of the Illinois river for a number of years?

A. Why to an extent; not chemically; I have never made any analyses or anything of that kind, but just noticing the stage of the river and the water in a general way.

Q. What was the condition of the Illinois river before the opening of the drainage canal as to volume and current and stagnation?

A. Well it was somewhat less than it is now; considerably so I should say; not the current that we have now.

Q. Did a scum form on the river at this point during low water?

A. It did, yes sir.

Q. Was there an odor in the river?

A. I have noticed odors at times, yes.

Q. Have you noticed that odor in the river since the opening of the drainage canal in January, 1900?

A. Well, I wouldn't be sure about that; I would rather think that I have, but I wouldn't be sure; I wouldn't be positive since that date.

5392 Q. What is the condition of the waters at this point since the opening of the drainage canal as compared to its condition prior to that time?

A. Well I would consider that it is better than it was.

Q. Is there or has there been typhoid fever in this vicinity?

A. Yes sir.

Q. Among what class of people has it been, those using the river water for domestic purposes or those using the public water supply?

MR. JEFFRIES: We object to the question for the reason that it is immaterial and for the further reason that it assumes that the people are using and have used the water from the Illinois river for domestic purposes, and there is no proof of any such fact.

A. All classes.

Q. Has there been an increased or decreased amount of typhoid fever since the opening of the drainage canal?

A. Typhoid fever has been increasing here probably for the last ten or fifteen years.

Q. Have you had cases of typhoid fever under your own observation during the last three years?

A. Yes sir.

Q. How many?

A. Well, ten or twenty; may be thirty; I don't know; I
5393 would not say positively; I think though at least thirty.

Q. Do you distinguish between typhoid fever and typho-malaria?

A. Yes sir.

Q. Have your cases been among people who drank from the public water supply or from the Illinois river?

A. Both.

Q. Have you a Board of Health in this town?

A. We have now one member, who is the Health Officer here.

Q. What is done by you in your practice with the dejecta?

A. Disinfected and buried.

Q. Is it both disinfected and buried?

A. Yes sir.

Q. Do you know as to the practice of other physicians here in that respect?

A. I couldn't say positively, no sir, I couldn't but that is my impression; that they do, but that is only surmise though.

Q. Since the opening of the drainage canal has there been this stagnation of the water which you previously observed?

A. No I think not; we have had higher water since.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How does the current or flow of the water compare now to what it was prior to the opening of the canal?

5394 A. It has increased, I should say.

Q. Increased very greatly has it not?

A. No, only during the high water that comes in addition to that; there isn't so much of an increase; it is considerably more though than it was, I would say.

Q. How much of your time do you spend on the river, doctor?

A. Not much now; during the spring months, we have the other part of the river shut out, and our practice across the river down the river and up above here, is a great deal of it done in a launch. I own a launch and we go out a great deal that way; that is about all; when the water gets down in the summer time;—low water time, I am not on the river much because I can go to my work by my buggy, although we do make excursions and trips on the river on the launch all the year round, in the open season—except winter time.

Q. At intervals.

A. Yes sir.

Q. The number of cases of typhoid fever has increased to some extent since the opening of the canal has it not doctor?

A. Yes sir, and before; it has been increasing for a good many years.

Q. Particularly as to the time since the opening of the canal since January, 1900?

5395 A. No, I don't think they have increased any faster since the canal was opened into the river than they did for the last ten or fifteen years.

Q. But there has been a gradual increase?

A. A gradual increase.

Q. The people in this town pretty generally use the water from this public supply, do they not?

A. Yes I think they do, but that is pretty hard to state that definitely, because there is a portion of the town that does not use the public supply; they have wells; perhaps half of them.

Q. What do they use?

A. Well water; pipes driven down into the sand from 20 to 25 or 30 feet.

Q. Do the people use the water from the river to any extent for domestic and drinking purposes?

A. Oh, I think not; possibly these people living along the river in the cabin boats do; but otherwise I don't think it is used at all.

Q. This deep well from which the public supply of water is obtained is located as I understood you to say how many feet from the river bank?

A. Well it is ten or eleven blocks, 300 feet to the block, 3,000 feet possibly from the river.

5396 Q. Do you know the character of the soil through which it is driven?

Q. Sand; the first eighty feet is sand and the next ten feet is gravel; we have about eighty feet of sand here and then [illegible] feet of gravel; then rock. They usually drive right down into that sand or gravel for the city water supply.

Q. When you say the water is better now than it was before the canal was opened, not having made any analyses of the water as you have stated, you judge altogether from the fact that there is an increase in volume and a material increase in flow, and from the appearance of the water do you not?

A. From appearances mostly; it is clearer under the same conditions, than it was before.

Q. You have noticed at times a greasy, oily appearance to the water, haven't you since the opening of the canal?

A. Yes sir, and before.

Q. Where did you study medicine, doctor?

A. Jefferson Medical College, Philadelphia.

Q. How old are you?

A. I am 52.

Q. You are Dr. Bley, Sr., then are you?

A. Yes, I am the elder.

Q. Is Dr. Bley, Jr. your son?

A. Yes sir. It might be well that I make a correction here.
5397 I am the one that signs my name "Junior." My father's
name was George. Prior to his death I signed my name "Junior" and it became rather unhandy after he died, to drop that name "Junior" and I just kept it right up. The Junior now is W. C. Bley, and my name is George.

Q. Was your father a physician?

A. Yes sir. GEORGE BLEY, Jr.

5398 Beardstown, Illinois, July 20, 1903.

L. W. GOODELL,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in Chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. L. W. Goodell; Beardstown, Illinois; I am in the wholesale and retail ice business and I am in the fish business.

Q. How long have you resided in Beardstown?

A. Since 1877.

Q. How long have you been engaged in the business of selling ice and fish?

A. I have been in the ice business myself since 1887 and in the fish business about seven years.

Q. Are you a fisherman or engaged in the business of buying fish from fishermen?

A. We buy fish from fishermen and we run a seine also.

Q. Do you personally engage in the seining?

A. No I don't personally; my partner engages in the seining.

Q. What is your partner's name?

A. George Swan.

5399 Q. What was the condition of the water of the Illinois
river prior to the opening of the drainage canal in January, 1900?

A. Well with reference to volume?

Q. Yes sir and current and appearance.

A. Well the water would get pretty low at times; the current was quite sluggish and the water somewhat riley, dirty looking; not very clear looking.

Q. Did you notice or see here a scum or growth in the water before the opening of the drainage canal?

A. Yes I have noticed a growth, a green growth, a sort of a vegetable, a small vegetable with two or three leaves, a little short root that would form in large masses over the surface of the water.

Q. Did you ever notice any odor or smell in the water prior to the opening of the drainage canal?

A. I don't recall; I don't recollect whether there was any odor to it or not in the summer time; I have noticed it in the winter time when there were holes cut in the ice; there have been times when a great many fish died in the winter time when there was a coating of ice on the water.

Q. To what substance did you attribute this smell; what was it like?

A. Well I don't know; I didn't notice particularly at the time, except this sewage from Peoria and Pekin; I think
5400 it was that partly.

Q. How far from here to Pekin and Peoria?

A. I think it is about 80 miles to Pekin, and about 90 miles to Peoria, probably.

Q. How far to Copperas Creek dam, about?

A. Well, I don't recollect; something like 50 or 60 miles, I believe they call it.

Q. From what water did you get the ice before the opening of the drainage canal?

A. Cut it from the waters of Muscoopin Bay from the arms that project off the river above the C. B. & Q. bridge.

Q. Is that water derived from the Illinois river?

A. Yes. Both from that and from surface water that drains into the bay at the north end of it.

Q. How frequently have you known the fish to die under the ice at this point prior to the opening of the drainage canal?

A. As I recollect it, it was at least two winters that the fishermen complained largely of the fish dying.

Q. How frequently have you noticed an odor coming from the water from under the ice, prior to the opening of the drainage canal?

A. Several times; I wouldn't say exactly how many.

Q. Since the opening of the canal, has there been this
5401 growth or green plant in the water?

MR. JEFFRIES: Objected to as leading.

A. I haven't noticed it in the river.

Q. Since the opening of the drainage canal, have you cut ice and put it up at this point?

MR. JEFFRIES: Objected to as leading.

A. We cut ice this winter and the winter before last.

Q. If there was any odor, you may state—from the water during the last three years?

A. I didn't detect any.

Q. Did the fish die under the ice in the last three years?

MR. JEFFRIES: Objected to as leading.

A. Not to my knowledge.

Q. As compared with the conditions before the opening of the drainage canal, what has been the condition of the ice taken from the Illinois river and its bays and arms here since the opening?

A. I haven't noticed any difference.

Q. As compared with the conditions before the drainage canal was opened, what has been the condition of the water, in a general way since the opening?

A. The water looks clearer.

5402 CROSS-EXAMINATION, By Mr. Jeffries.

Q. How long did you say you had lived here?

A. Since 1877.

Q. And you have been engaged in this same business continuously since that time?

A. I have been in the ice business myself since 1887, my father was in the ice business up to the time of his death, and I took his place.

Q. How long have you been in the fish business?

A. I think it is about seven years.

Q. You don't drink the water from the Illinois river, do you?

A. No, the town here is supplied with water from drive wells.

Q. You don't use the water from the river for domestic and drinking purposes, do you?

A. In the winter time we drink the water from the river when we are cutting ice; I don't use it for my family for any purposes.

Q. Where did you say it was that this ice was cut from?

A. A body of water known as Muscoupin Bay up above the C., B. & Q. bridge.

Q. There is no current through there is there?

A. I don't know as there is a current through there now; there has been until quite recently; there was a current 5403 there when we were cutting ice last winter.

Q. Well, where does the current come from?

A. Well it comes down through Hager's Slough and they overflow all the way through up to the Sangamon River, through the bottoms between here and the Sangamon.

Q. This bay then is fed from these bottoms and streams coming from the hills and the bottoms leading up through the Sangamon river?

A. Yes, the water that comes down through there when the water is sufficiently high; there are times when there is no current whatever and it gets its current from the backwater of the Illinois river.

Q. Now how deep was the water in this slough or in this bay when the ice was being cut?

A. The deepest point was about sixteen feet.

Q. Ranging from sixteen feet to what depth?

A. I think probably there was an average depth of twelve feet.

Q. A kind of a basin then in the bay?

A. Yes, it is a depression; the bay is about a mile and a half long and a half or three-quarters of a mile wide.

Q. Have you noticed an odor on the water before the opening of the canal?

A. Yes, I have at times; I noticed an odor when we cut 5404 a hole through the ice; I noticed an odor there.

Q. Have you noticed any odor since?

A. No, I haven't detected it since; the water has been unusually high at the times we have cut ice, since the introduction of this water from above.

Q. You have noticed an oily, greasy covering on the water since the opening of the canal, have you not?

A. Well, along on the edges I have noticed an oily substance, along close to the shore; I can't say that I have detected any out in the bay or out in the body of the river.

Q. You have made no careful examination of the water?

A. No, I have never made any careful examination of the water.

L. W. GOODELL.

5405 Beardstown, Illinois, July 20, 1903.

H. EHRHARDT,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. My name is H. Ehrhardt.

Q. Where do you reside?

A. Beardstown, Illinois.

Q. How long have you lived here?

A. I have lived here 51 years.

Q. What is your business?

A. I am a physician.

Q. How long have you been practicing medicine?

A. Twenty-six years.

Q. Do you hold any position in the municipal government of the city?

A. Yes sir, I do.

Q. What is it?

A. Health officer.

Q. Are you acquainted with the Illinois river?

A. A portion of it.

5406 Q. What portion?

A. That portion contiguous to Bearstown; in the vicinity of Beardstown, within a radius of ten or fifteen miles above and below Beardstown.

Q. How did you get acquainted with the river, doctor?

A. Why, by almost daily observations.

Q. Have you been on the river much?

A. Yes, quite frequently.

Q. Before the opening of the drainage canal what was the condition of the Illinois river at this point?

A. Before the opening of the drainage canal why the river during low stage was often covered with a vegetable growth; sort of a fungus, grass, and also a scum.

Q. What kind of a current did it have?

A. The current during low stage of water was very sluggish.

Q. Have you observed the condition of the river since the opening of the drainage canal?

A. Yes sir.

Q. What effect, if any, has the opening of the drainage canal had upon the waters of the Illinois river at this point?

A. Well I have noticed so far as external appearances go, the water has had a better appearance; the water is clearer and it has been devoid of that vegetation which was observed before.

5407 Q. What is the character of your practice here doctor?

A. General medicine.

Q. Has typhoid fever in Beardstown been on the increase or decrease since the opening of the drainage canal?

A. I have observed no cases of typhoid fever before or since.

Q. Do you know of any people having died of typhoid fever in the last four or five years, in Beardstown?

A. I do not.

Q. Do you know of any typhoid fever existing in this territory?

A. At present?

Q. Yes?

A. I do not.

Q. Or within the last two or three years?

A. I do not.

Q. How does the health of the people living along the river compare with that of those living in the foot-hills at this point?

A. Well it compares better; the health is better than those living on the foot-hills or in the high lands.

Q. Have you as much malaria in this district or vicinity now as before the opening of the drainage canal in 1900?

MR. JEFFRIES: Objected to as immaterial and leading.

A. I have noticed no difference.

Q. Have you had any cases of typho-malarial fever?

A. Yes sir, I have, so designated.

5408 Q. What is typho-malarial fever?

A. Well I consider typho-malarial fever a malarial fever that, owing to intestinal irritations assumes typhoid character.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. You say from external appearance of the water it is better than it was prior to the opening of the canal?

A. Yes sir.

Q. You know nothing of its internal conditions?

A. Nothing watever.

Q. The water is not used here at Beardstown for domestic and drinking purposes?

A. No sir, not generally; I would like to modify that. It is used, but it is used after it is filtered, understand.

Q. In what way?

A. Beardstown obtains its water supply from deep wells; drive wells, so known. Some call them artesian wells, and that water that supplies those wells, is the river water, but it is filtered through beds of sand and gravel. We know that that is river water, because the water rises to a level in these wells to the same height as the stage of the water in the river.

Q. These wells, then, are driven out in the soil away
5409 from the river, over the town?

A. Yes sir.

Q. The wells are not on the bank, directly on the bank of the river?

A. Some of them are directly on the bank of the river, but they are filtered just the same.

Q. They are scattered out all over the town?

A. All over the town, yes sir. The city supply, what we call the city waterworks, receive their supply from wells put down about ninety feet, while all other people that have open wells—open wells are a thing of the past in this town—they also use drive wells, but they put them down anywhere from twenty to thirty feet. They obtain just as good a supply of water. Now you can put down a drive well right in the center of the river, and by driving it anywhere fifteen or twenty feet into this sub-soil, you can obtain a pure quality of water.

Q. Is the water—from any observation or examination that you have made or information that you have suitable for domestic purposes?

A. I consider it not suitable.

Q. That is the waters of the Illinois river?

A. Before filtration?

Q. Yes?

5410 A. Without filtration I don't consider it suitable for domestic purposes.

Q. You think you have filtration by means of these wells sunk in the sand?

A. Yes sir, I consider our driven wells, the water to be perfectly filtered.

Q. What is the difference between the current of the Illinois river now and since the opening of the canal to what it was prior to the opening of the canal?

A. I think the current is more rapid since the opening of the canal.

Q. You say you have seen this green vegetable grown on the waters of the river at certain seasons of the year?

A. Especially at low stages of the water. In my opinion it was due to the low stage of the water. The less current we have in the river the less chance the vegetation has to flourish.

Q. Have you noticed since the opening of the canal a greasy, oily appearance to the surface of the water?

A. I have not.

Q. Have you been out much on the water recently? Since the opening of the canal?

A. Yes, I have been out on the water quite often.

H. EHRHARDT, M. L.

5411 Beardstown, Illinois, July 20, 1903.

ED. F. HARRIS,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Ed. F. Harris is my name; residence Beardstown; and am in the fish business, buying fish.

Q. Have you also been a fisherman with nets yourself?

A. Yes sir.

Q. How long were you engaged in fishing?

A. Oh, I have been fishing, that is and buying fish, for the last eighteen or twenty years; about eighteen years.

Q. What amount of territory have you covered?

A. Well, pretty near all the river from Peoria down below Kampsville.

Q. Before the drainage canal was opened, in January, 1900, what was the condition of the Illinois river?

A. Well sir, the water wasn't as clear as it is at the present time; we always had through the month of July and August we always had a green scum on the river and in the winter time we could cut open holes in the ice in the river and there would be a gas smell from it.

Q. Did some material gather on your nets before the
5412 drainage canal was opened?

A. Yes sir. Well, no material only just the mud and moss of the river before that. That is here.

Q. Did you drink the water of the Illinois river before the drainage canal was opened?

MR. JEFFRIES: Objected to as leading.

A. Yes sir, I drank it.

Q. Since the opening of the drainage canal what has been the condition of the water in the river?

A. Well, the water has been very clear, and I think it has been in better shape except winter before last; we had a slime here winter before last, a very little last winter, but otherwise I think it is in better shape than it was before. It clears up a good deal quicker.

Q. Has there been this green scum upon the water since the opening of the canal?

A. Yes sir; see it every summer when the warm weather begins.

Q. On the river?

A. Yes sir.

Q. Since the opening of the canal?

A. Yes sir, but not so much so as before there was so much current as there is now.

5413 Q. Did you notice on the river before the opening of the drainage canal a little three or two-leaf plant that grew on the surface?

MR. JEFFRIES: Objected to as leading.

A. Yes sir; that I think comes out of the lake; I always thought so.

Q. Does it form here on the river since the opening of the canal?

A. It forms very little, very little.

Q. Describe this slime that you found on your nets since the opening of the canal?

A. Well it is a white substance, as near as I could give it, it is where you would boil pigs feet together, gelatine, but it is very hard to get off; it is very near a whitish color; like stone color, you might say.

Q. Does it form in strings and hang down from the nets?

MR. JEFFRIES: Objected to as leading.

A. Yes sir.

Q. As a fish dealer do you use ice considerably?

A. Yes sir.

Q. What has been the condition of the ice?

A. The ice has been good.

Q. Is it better or worse since the opening of the canal?

5414 A. Well I don't think it could be any better than what we have got here; it is as clear as a crystal.

Q. Is the ice taken here from the river or lakes?

A. Taken from the bay above here.

Q. Does it form from river water?

A. Yes sir.

Q. Are you pretty well acquainted with the fishermen in this vicinity?

A. Yes sir.

Q. Have you known whether or not when they are on the river they drink the river water?

A. Well yes, drink it more or less; of course in the summer time they have ice with them, so they use it in that way.

Q. Do you know of any typhoid fever in the last three years among the fishermen?

A. Not that I know of. As a general thing they have got good health.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long have you lived here?

A. Oh, I have been here thirteen years last November.

Q. In the fish business all the time?

A. Yes sir.

5415 Q. You don't use the water of the Illinois river at your home for domestic and drinking purposes?

A. No sir.

Q. Now what did you say about being out on the river?

A. Why I say we drink it when we are out on the river; if we run out of water when we are seining, and take ice, we dip up some water. Of course in the morning, we usually take a keg of water with us—well water.

Q. You say you notice the green scum forming to some extent since the opening of the canal?

A. Well there has been some scum on the river nearly every summer, during the months of July and August.

Q. Is it an oily, green scum?

A. No, not hardly now; not as much as it used to be.

Q. You don't know whether there is deleterious matter in the water or not?

A. Don't know anything about it, no.

Q. The bay up here is back from the river?

A. Yes sir, the river affords water for the bay.

Q. Backs up in the bay?

A. Yes sir, when the river comes up, when the river is up high, it comes right down through from the other way. In low stage of water though, you can run in and out of the bay at any time with steamboats.

5416 Q. That is at this end?

A. Yes sir.

Q. Unless the river overflows its banks, there is no current in this bay?

A. No, not so the river gets so the water comes from the other way. ED. HARRIS.

5417 Beardstown, Illinois, July 20, 1903.

MARTIN McDONOUGH,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. Martin McDonough, Beardstown, Illinois; Park Hotel.

Q. How long have you lived in Beardstown?

A. All my life; I was born here.

Q. Do you fish and hunt some on the Illinois river?

A. I fish; never hunt.

Q. Do you fish with a rod?

A. Yes sir.

Q. How frequently have you indulged in that sport?

A. Well, during the fishing season several times a week.

Q. What was the condition of the Illinois river before the opening of the drainage canal in January, 1900?

A. Well, when the water got lower than it does now—the water doesn't get as low now, hasn't got as low since; it seems to me as though during the low water period, there was a difference of a foot of water, probably fifteen or eighteen 5418 inches. I noticed in the fall we had a scum on our water that we don't have now.

Q. How about the clearness of the water?

A. Well, I don't see much difference. I don't know very much about that.

Q. What is the condition of the ice, now as compared with the ice before the drainage canal was opened?

A. Well, I don't see any difference; the ice that we use comes off of the bay and that water is usually always clear.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say the water isn't as clear now as it was before the canal was opened?

A. I said that I didn't know very much about that; I don't know as I could say on that.

Q. You are not on the river much?

A. Yes, I am on the river a good deal.

Q. But you didn't observe it?

A. I didn't observe it so much because when we fished you see our fishing is not so much on the river as in the back water, especially since this water has been turned in, it has changed our fishing grounds; we used to get some fishing in the river then, but we don't now. We get it in the back water. It
5419 has driven us in the back waters.

Q. This ice is cut from the bay up here where the water is still and deep?

A. Yes.

Q. During low water there is very little water from the river gets in?

A. No, that's right. Well it is an arm; like that (indicating). Of course it is all river but it is back from the river; there is no current in there.

Q. And it is kept pure by the waters from the banks, by springs and branches running in?

A. I don't know about that.

Q. Well there is water running in it?

A. Well now, it is really part of the river, only the current doesn't get through there, and leaves the water dormant, and it doesn't muddy.

Q. You don't know whether the water contains deleterious matter or not?

A. No, I do not.

Q. You don't use it in any way?

A. No sir. MARTIN McDONOUGH.

5420 **Beardstown, Illinois, July 20, 1903.**

THOMAS K. CONDIT,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. Thomas K. Condit, Beardstown, Illinois. My occupation is cashier of the First National Bank.

Q. How long have you lived in Beardstown?

A. Since 1874.

Q. Have you in a general way been familiar with the condition of the Illinois river water before and since the opening of the drainage canal?

A. I think so, yes sir.

Q. What was its condition before the opening of the canal?

A. Well, during the stage of low water, we had what we regarded as a very bad condition here, very stagnant water, during the months of August, September and October, when the river was low. In fact a greater portion of the time there was a green scum in front of the city here all of the time, and during the season of the fall of 1901, when we had a low stage of water, and that is since the drainage canal was turned in, why my
opinion is that we had a much better condition of the
5421 river than before; that is there was no smell to the river
and no green scum on the water.

Q. Before the opening of the canal, was there an odor here in the water?

A. There was during the summer months; during the latter part of July, August and September.

Q. What kind of an odor was it?

A. Well to me it was—it smelt more like rotten fish than anything else.

Q. Since the opening of the canal has there been any of that odor in the water?

A. Not that I have noticed.

Q. As a banker are you pretty well acquainted with the people in this vicinity?

A. Yes sir.

Q. What was the condition here before and what has it been since as to typhoid fever?

A. Well so far as my knowledge goes, there has been very little of it either before or after. Occasionally we hear of a case, but very seldom.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long have you lived here?

A. I have lived here since 1874.

5422 Q. Was this odor prior to the opening of the canal very offensive?

A. Well, to people of a very sensitive smell it was; and to others it was not. I live out on Seventh Street and my wife used to complain of it a great deal more than I noticed it; that is, she called my attention to it.

Q. And you have not noticed any such odor since?

A. No sir, I haven't noticed it since 1901.

Q. Have you been on the river a great deal?

A. No sir, not a great deal.

Q. Neither before nor after the opening of the canal?

A. Oh, I am on the river probably during the summer months twenty or thirty times, fishing or boating. There is hardly a day passes that I don't walk out on the wagon bridge, since it was built, in the morning or evening.

Q. You don't use the water for domestic purposes or drinking purposes?

A. No sir, not at all.

Q. The people don't generally use it?

A. Only people living on the river front; we have a great many drive wells here in the town, but the better class of residents use the city water altogether; I don't think there

5423 are now more than ten or fifteen open wells in town.

Q. When you say the water is better now than it was before the canal was opened, you take in consideration the fact that there is a larger volume of water, a much better current and the water seems clearer?

A. Well, I am basing my position on the general conditions; that is as it appears to me.

Q. Well those are the conditions, are they?

A. Yes sir. Of course there is a stronger current, and during the last eighteen months, we have had the higher water all the time, and consequently there has been a greater volume of water passing down the river.

THOMAS K. CONDIT.

5424 Beardstown, Illinois, July 20, 1903.

G. P. HOLLINGSWORTH,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Johns.

Q. What is your name, residence and occupation?

A. G. P. Hollingsworth; fireman on the Burlington out of here, C., B. & Q. Residence, Beardstown.

Q. Did you formerly live at Browning?

A. Yes sir.

Q. What was your business there?

A. I was in the fruit business there; had a fruit farm.

Q. Had you an engagement there to take samples of water for the State of Illinois?

A. An engagement at Browning?

Q. Yes.

A. Yes sir.

Q. With whom was that arrangement made?

A. With Mr. J. A. Harman, and with Dr. J. H. Long.

Q. Under your arrangement with these gentlemen, how frequently did you take samples of water?

A. Well I don't remember just now; I believe it was
5425 every two weeks, as I remember it.

Q. How many samples did you take?

A. Well, I don't remember that either; I didn't keep any account of it; I took samples at two different times and I don't remember just how many I took.

Q. About when did you commence taking samples?

A. Well I believe it was along in the first of June.

Q. Of what year?

A. 1899.

Q. Did you take samples after the opening of the drainage canal in January, 1900?

A. Why, I think I did; I took at two different times; I took one the next year. One was the second year afterwards—the first year after.

Q. Did you take samples in the fall of one year and the summer of the next succeeding year?

A. No sir.

Q. Did you take samples in the fall of one year and the fall of the next succeeding year?

A. I began taking the next year in June—the first year in June and the next year about the same time, I believe; it was a little later when I began to take these samples the second year.

5426 Q. Did you have directions as to the manner of taking these samples?

A. Yes sir.

Q. Were they printed or oral?

A. Printed and oral both.

Q. How many samples did you take each time?

A. Well, I think there were two; two different samples.

Q. Who furnished the vessels?

A. Dr. Long, I believe.

Q. What kind of vessels were they?

A. They were glass bottles; one was a large bottle; I don't know what it contained; and the other was a small bottle, I don't think it contained over half a pint; they were sterilized bottles.

Q. Where is Browning with reference to the Sangamon River?

A. About one mile southwest.

Q. Above or below the mouth?

A. Below the mouth.

Q. At what point in the river did you take the samples?

A. Well, I was instructed to take those samples about 300 feet above the mouth of the Sangamon River as near as I could get them.

Q. With reference to the position of the river and the current, where did you take the samples?

5427 A. Well, I took the samples as near in the center of the stream as I could; there was not much current there.

Q. At what depth in the water did you take them?

A. Why, my instructions were about as far as I could reach from my elbow down.

Q. Describe the manner in which you handled the bottle at the time you took the sample?

A. Which bottle, the large one, or the small one?

Q. Well the large one first?

A. Well, the large one, I removed the cork and held it down about as far as my elbows and filled it; the sterilized bottle I didn't uncork until I had it under the water. I held it under the water; that was my instructions. I aimed to follow instructions as near as I could in that line.

Q. Were you furnished— After the bottle was filled what did you do with it, with reference to the bottle?

A. Why I corked it up and put it back in its case, in the box that it was sent in.

Q. Was any kind of a cover put over the cork?

A. There was a rubber, a piece of rubber I believe put over the cork of the small bottle; none over the large one.

Q. How was the bottle treated after that with reference to tying it up and putting a tag on it?

5428 A. It was sealed with a stamp.

Q. What was your stamp?

A. No. 10.

Q. How did you pack the smaller bottles?

A. The smaller bottle was packed inside of a small can with ice around it; the small can was packed inside of a large can with ice around it also; there was a small piece of cotton in the bottom for the small bottle to sit on so it wouldn't be broken.

Q. Did the small can contain the bottle?

A. Yes sir.

Q. Did you then put that small can in a larger can and put ice in the larger can around the smaller one?

A. I don't know now just how I did do it; let's see. No there was excelsior packed around the smaller can.

Q. How did you pack the small bottle?

A. Packed the small bottle in a small can with ice around it, and with cotton around it and then I packed the small can in a larger can with ice and excelsior around it.

Q. What did you do with the large bottle?

A. I placed it in the box and packed excelsior around it.

Q. Now after the packing, did you put a tag upon it?

A. Yes sir.

5429 Q. Did you make a notation on the card with reference to the time of taking these samples?

A. Yes sir.

Q. I hand you now nine tickets, the first one dated August 3, 1899, and you may state whether or not the handwriting upon those tickets is yours?

A. I guess it is not anybody else's.

Q. The question is are they in your handwriting?

A. Yes sir.

Q. Now with each two bottles of water that you obtained, did you fill out a ticket similar to those exhibited to you, upon which you put the date, your name, the temperature of the water and of the air and then make some remarks about the current or the rain or something, in addition to signing.

A. Why I put them on those, yes sir.

Q. Did you fill out such a ticket with each pair of samples of water that you took?

A. Yes sir.

JUDGE JOHNS: I now hand the Commissioner the tickets and ask to have them marked State of Illinois Exhibit No. 6 for identification to witness G. P. Hollinger's testimony.

So marked by the Commissioner.

Q. Afer this ticket was so filled out you may state whether or not you placed the ticket in an envelope?

5430 A. Yes sir, I did.

Q. I hand you now an envelope upon which is written "Geo. A. Wiggin M. D." Milan, Illinois, and on which is also written in lead pencil "J. H. L." and ask you to state whether you placed these tickets made out by you in such an envelope?

A. Yes sir, I did.

Q. After it was placed in the envelope, what did you do with it?

A. I tied it to the neck of the larger bottle.

Q. Then what did you do with the samples?

A. I took it to the express office to be shipped.

Q. From what place and to what place and to whom was it shipped?

A. Shipped from Browning, Illinois, to Dr. J. H. Long, laboratory, I think it was 2124 Dearborn Street, Chicago, Illinois.

Q. What time in the day did you take the samples?

A. Took the samples about five o'clock in the evening.

Q. How were they shipped, by express or freight?

A. By express.

Q. How long a time elapsed from the time the water entered the bottle until the package was delivered to the express company?

5431 A. Well, about three hours; took the sample about five o'clock and the express company received them about eight o'clock.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You say you personally made these collections?

A. Yes sir.

Q. How do you know that the bottles were sterilized?

A. Why, I don't know only they told me that they were sterilized. Mr. Harman told me they were sterilized when we were up the river.

Q. You don't know personally that they were?

A. No sir, I don't know it personally.

Q. How deep under the water did you go with the bottle in the water?

A. Which bottle?

Q. Either one of them or both?

A. Well I stated I rolled my sleeves up to my elbows and held them down as far as I could, up to my elbows.

Q. About a foot?

A. About a foot.

Q. Did you rinse the bottles?

A. No, I wasn't instructed to rinse the bottles and I didn't.

5432 Q. You collected a sample once every two weeks?

A. As far as I remember, yes; I don't remember much

about the dates because I didn't keep any track of the dates at all; I wouldn't give any dates accurately, because I don't remember.

G. P. HOLLINGSWORTH.

Adjourned at 5 P. M. to meet at Havana, Illinois, at 9 A. M., July 21, 1903.

5433 Havana, Illinois, July 21, 1903. 9:00 A. M.

Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

HAROLD G. HEBERLING,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Harold G. Heberling.

Q. Where do you live Mr. Heberling?

A. I now live in Easton this county, about thirteen miles east of here.

Q. Did you formerly live in Havana?

A. Yes sir.

Q. Did you ever take any water from the Illinois river for the Sanitary District of Chicago?

A. I did, sir.

Q. What years did you take the water?

5434 A. 1899 and 1900 I believe.

Q. At what point?

A. At a point above the mouth of Spoon river and Quiver Lake.

Q. How far is that from Havana?

A. That's about three miles north of here.

Q. Up river?

A. Yes sir.

Q. Did you take it at any other points?

A. I took it a couple of times when the ice was bad, I couldn't get there I took it above the mouth of the Spoon river on the other side.

Q. How often did you take the water?

A. I took it once a week.

Q. What did you take it in?

A. I took it in bottles that looked to be about the size of a quart, and others that looked to be about two ounce bottles—I mean a gallon I should have said.

Q. Where did you get the bottles from?

A. Why they came from the Adams Express Company from the University at Urbana each time; and from Chicago and I forget now where the other one was from; there was three sets of them though I know.

Q. University of Chicago?

5436 A. Yes sir.

Q. Health Department of the City of Chicago?

A. That's right.

Q. What condition were the bottles in when you got them relative to being corcked or uncorcked?

A. I always found them corked, with a rubber cloth over the cork.

Q. What kind of stoppers did the bottles have?

A. Glass stoppers.

Q. After you got the bottles just describe how you filled them?

A. Why I had a device that held one of the large and small bottles with the mouths even at the top and I would reach down and uncork the bottles and let them run full; then cork them under the water and pull them out and put on the cap.

Q. Were the bottles above or below water when you uncorked them?

A. Below water.

Q. After they were corked and the rubber cap placed over the tops of the bottles what did you do with them then?

A. Why I brought them to town here and either set them on the market boat where the expressman could come down and get them, and if he didn't come I carried them myself.

Q. How did you prepare them for shipment?

5437 A. Why they were packed in a case that would just about fit the bottle, with excelsior around them and then ice packed around them; in a receptacle that just fit the bottle, and with ice around that.

Q. Did you place any mark of identification upon each sample?

A. Why I placed the tags where they were to go. Every one had my name on I believe; had to get out the tag and put on my name and about the steamboats, the change in the currents, temperature of the water according to centigrade thermometer and the direction of the wind and the time also that they were taken.

Q. Anything else?

A. In regard to steamboats passing; that was put down.

Q. The date of taking?

A. Yes sir.

Q. Place of taking?

A. Yes sir.

Q. Temperature of the air?

A. Yes, temperature of the air too, that is right.

Q. And the sample number?

A. Yes sir.

Q. I show you a card, sample No. 1111, and ask you if
that card is in your handwriting and if you placed a similar
card to that upon each sample that you collected and ship-
5438 ped, with the proper memorandum, as indicated in your
last answer?

A. Yes sir.

Q. Did each card have the directions for collecting and sending samples of water for analysés printed on the back similar to the direction on the back of the card I just showed you?

A. Yes sir; I didn't notice that, but I know the directions were always there. I did that rinsing out business too.

Q. Describe what you mean by that?

A. Well I immersed it under the water, took out the cork and let in some water, and rinsed it out.

Q. Then filled it up afterwards?

A. Yes sir.

Q. Now after you had filled the bottles, sealed them and tagged them and packed them in the manner that you have testified to, to whom did you ship the samples thus collected?

A. Well I believe it was Palmer at Urbana, and I can't remember the names exactly.

Q. Was it Prof. Jordan of the University of Chicago?

A. Yes sir, that is the man.

Q. Did you ship any to the Health Department of the City of Chicago?

A. Yes sir.

Q. Dr. Reynolds?

5439 A. Yes sir.

Q. By what express company?

A. By the Adams. They were at the American first and then I changed them over to the Adams.

Q. How long an interval would intervene from the time the samples were collected until they were placed on the train for shipment?

A. If I remember right, I would take them between nine and ten o'clock and they would go out sometime about one. If I remember rightly.

Q. Did you follow the instructions on the back of the card for taking the water?

A. Yes sir.

MR. TODD: Mr. Commissioner I ask to have sample card No 1111 marked Sanitary District of Chicago Exhibit 8 for identification.

Said card is so marked by the Commissioner.

CROSS-EXAMINATION.

By Mr. Jeffries.

Q. Where do you live?

A. I live at Easton, this county.

Q. How far is that?

A. Thirteen miles, out on the Central road.

5440 Q. You mean the Illinois Central?

A. The Illinois Central.

Q. Where did you live when those samples were taken?

A. I lived here in Havana.

Q. What was your business then and what is it now?

A. Why I didn't have much of any business then except to fish along the river. I am now a painter and paper hanger.

Q. Did you collect these samples with your hands or did you use some kind of an instrument?

A. I used an instrument, that is to hold the bottles under, I did.

Q. What kind of an instrument?

A. Why an instrument that I could set on the large bottle and the small bottle, with the mouths at the same level; it had a handle to it; held them under the water while they were filled, while it was cold.

Q. When did you take the stopper out?

A. I took the stopper out when I had them under the water about a foot; whatever it said there; I followed the directions.

Q. The stopper from both the large and small bottles were taken out under the water?

A. Yes sir.

5441 Q. When was the stopper returned to the bottles?

A. The stopper was returned to the bottle while it was still under the water, before it was taken out.

Q. And after you had returned the stopper you put the tag on?

A. Well I first rinsed out the bottle; holding the mouth of it barely under the water and let the water run out that was in there.

Q. Then what did you do?

A. Well then I filled her up and corked it up and sealed her up with a rubber, put the lead seal on it, tagged it up, put the bottle inside the tin can and packed ice around it then packed it around with excelsior and took them down to the market boat; or I never packed them in ice until I got down here to the boat, in taking the water.

Q. How many times did you miss getting the samples off on the train the day that you collected them?

A. I don't know that there was any time; I don't remember any.

Q. Don't you know that there were three or four times?

A. Well, there might have been; not my fault though.

Q. You don't mean to say that you got them to the train in time?

A. No, I didn't get them to the train but I got them down 5442 here on the boat. There may have been a time or two that there was one case delayed that didn't get here; I think there was.

Q. You never took them to the express office yourself?

A. A few times.

Q. Whom did you put them in charge of at the boat?

A. Why I would just set them on the boat there and nobody would bother them.

Q. Whose boat was it?

A. Rudolph and Shafer's.

Q. They were already marked, ready for shipment?

A. Yes sir.

Q. Would you send the expressman word?

A. Yes sir, but he knew the day that I collected them on; I didn't send him word every time.

Q. Well you couldn't tell whether he got them that day or not?

A. Yes, I could.

Q. How could you tell?

A. Well I would be down here to the boat and see.

Q. Now as a matter of fact some of those bottles layed there several hours after you put them on the boat, did they not?

A. Well, possibly they did.

Q. Don't you know that they did?

5443 A. No I don't know as I do.

Q. Well, you wouldn't say that they didn't?

A. No sir.

Q. You say you never notified the expressman each day?

A. No sir.

Q. Why didn't you?

A. Why, it was his duty to come down there and get them; he saw me carry the boxes away from his office and down the hill here every day that I got water; he said he would do it; that is all I know.

Q. How far is it from the express office to the boat where you would put these samples?

A. Why it is a little over a block; pretty near two blocks, I guess.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Did you see him come there for the samples?

A. Many a time, yes sir.

Q. Did you ever discover any samples that he failed to call for?

A. No, I don't believe I did.

Q. This expressman was the agent of the Adams Express Company that you sent the samples by?

5444 A. Yes sir. Mr. Barry. Mr. Bill Barry.

H. G. HEBERLING.

5445 Havana, Illinois, July 21, 1903.

O. H. HARPHAM,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. O. H. Harpham; residence Havana; occupation, Postmaster.

Q. How long have you lived in Havana?

A. Fifty-eight years.

Q. Have you been a fisherman or in any way acquainted with the waters of the Illinois?

A. Not a professional fisherman; an amateur with a hook and line; I have been acquainted with the river all my life.

Q. What has been the condition of the Illinois river at this point prior to the opening of the drainage canal in January, 1900?

A. Condition as to what?

Q. Well as to the water, the character of the water and the substances in the water?

A. For a number of years prior to the opening of the drainage canal in low water in the river, the water was very foul; at times extremely so. I have in mind noticing that 5446 large islands of floating manure that came down. Prior to the time that I was appointed postmaster, I was in the hardware business and a number of years ago, how many I couldn't say, there was a large island of floating manure and offal, I thought it was from Peoria, from the distilleries, lodged against the pier of the wagon bridge. My attention was called to it from the fact that at that time I was one of the directors of the Illinois River Bridge Company, and we were fearful that it would injure the bridge and in attempting to remove it, we attempted to do so by blasting it, not having dynamite, we used common blasting powder. We were very unsuccessful in that and finally removed it by prying and knocking off pieces until the current swung it around and took it through. But it was so large it was impossible for it to get between the draw of the bridge.

MR. JEFFRIES: We move to strike out the answer for the reason that it is incompetent, irrelevant and immaterial; one particular and certain occurrence, prior to the opening of the canal and not tending to prove or disprove any issue in the case.

Q. JUDGE JOHNS: Prior to the opening of the canal, were there foreign substances in the water floating here generally, whether at high or low water?

A. Frequently at low water, there was a certain scum on 5447 the river and it was so much in evidence that you could see the wake or track of a boat; that was not always so, but it was occasionally so.

Q. Was there any smell to the water prior to the opening of the drainage canal?

MR. JEFFRIES: Objected to as leading.

A. At times, yes; that is, at low stage, and in warm weather, it was very offensive. I have noticed it up at my place of business and at my house, four or five blocks from the river.

Q. Since the opening of the drainage canal what has been the condition as to that?

A. I have never noticed anything of that kind, and I am on the river every day or two.

Q. Has there been any green scum on the river since the opening of the drainage canal?

A. Well, I think not, what you would call scum, this last month I have been on the river a good deal. I have a little launch; in fact, I have been on it frequently for several years, boatriding, and I noticed up the bend, the river was covered with seeds and the pods from the willows and maples; it was not a scum, when the wind blew from high water off from the bottoms, it would come out in the bend; I think it is noticeable now.

5448 Q. Now, as to the general character of the water since the opening of the canal as compared to what it was before, what would you say?

A. In my opinion the water is in better condition now than it was before. That is at the same stage.

Q. Do you know of any typhoid fever here since the opening of the drainage canal among the people using the water of the river?

A. I have not heard of a single case.

Q. Are you acquainted with the people of this community and know of them in your capacity as postmaster?

A. I think so pretty generally, yes, sir.

Q. Have you here a delivery system or do the people come to the postoffice for their mail?

A. We have no delivery system; they come to the postoffice for their mail.

Q. From what source is the water supply of the city?

A. The city derives its water supply from drive wells; the wells are driven into the sand; I think we have got one about six or seven blocks east of the river. The wells are driven some fifty feet I think, below the surface of the water before they take in water, and in my judgment, the water is not affected by the river a particle.

Q. Has it a sewage system?

A. Only a partial one.

5449 Q. Into what does the sewer empty?

A. The sewer empties into the river. The sewer only reaches up into the business part of the town a little ways, not very extensive.

Q. What proportion of the inhabitants in your judgment, use water from the public water supply?

A. It is hard for me to judge; one-third to one-half, possibly; a great many do not.

Q. From what other sources do the people obtain water for domestic use?

A. Almost invariably from drive wells, from pumps; there are very few open wells.

Q. What is the population of Havana?

A. About 3,400 or 3,500; I have forgotten the census report; I don't remember.

Q. How far is Havana from LaGrange Locks?

A. My impression is 18 miles; I am not positive.

Q. How far from Copperas creek locks?

A. Oh, I was thinking of Copperas creek locks in the first place; it is about 18 miles from Copperas creek locks; LaGrange is below Beardstown; I should think forty or fifty miles from here. They call it forty miles ordinarily to Beardstown, and it is ten or twelve miles below that to the locks.

5450 Q. How far from Peoria?

A. By rail 41 miles. We speak of it as fifty miles by river.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How far is it from here to the mouth of the Illinois river?

A. I couldn't tell you, sir; I have traveled it a great many times, but the distance I don't know.

Q. These sand wells that belong to the town are located seven or eight blocks you say from the river?

A. Yes, sir.

Q. Do you know the character of the soil or earth through which they go from the surface down?

A. Yes, sir. A few feet on the surface is what we call soil and from there to the bottom as far as we have gone, is sand and gravel with occasional streaks of clay here and there. Those streaks of clay are small; sometimes only an inch or two or a foot or two through.

Q. You say about from one-third to a half of the people of the town use water from these public wells?

A. Yes, sir; I think so.

Q. And the remainder of the people use water from private drive wells or ordinary cisterns?

5451 A. I know of no one who uses a cistern; almost invariably use drive wells, or open wells. The large majority are drive wells; now and then you will find an open well; it is so easy to get water with a drive well; it is easier and cheaper than to dig a cistern. You just simply drive a piece of pipe down and make a well.

Q. There don't any of the people of Havana use the water of the Illinois river for domestic and drinking purposes, do they?

A. No, sir.

Q. Do you consider this water good water for domestic and drinking purposes?

A. The river water?

Q. Yes, sir?

A. I think not, sir; I don't consider any open river water, river or pond or anything of that kind, proper water for domestic purposes.

Q. What is the difference in the flow of the water now and what it was before the Chicago drainage canal was turned into the Illinois river?

A. That is a question for an expert, because of the fact that the difference varies with the height of the gauge of the river; in high water it might be one thing and in low water radically another.

Q. What is the comparative difference in the current between then and now, greater or less?

5452 A. It is considerably greater .

O. H. HARPHAM.

5453 Havana, Illinois, July 21, 1903.

GEORGE W. BUNKER, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. My name is George W. Bunker; I am an upholsterer, repairing furniture.

Q. You reside in Havana?

A. Yes, sir.

Q. How long have you lived in Havana?

A. About twenty years.

Q. Have you fished or boated on the Illinois river?

A. I have done some boating, but never fished except with a hook and line. I lived on a boat on the river quite a while; on a cabin-boat.

Q. Were you employed upon steamboats here formerly?

A. I used to be employed, running down to East St. Louis on a steamboat.

Q. What was the condition of the Illinois river here before the opening of the drainage canal here in January, 1900?

A. Well, in low water, the condition of the water was 5454 very bad indeed; in very low water. The water was so impure that they talked a great deal then about blowing out the dam; thought that they would get better water by cutting a waterway out and letting the water pass off quicker.

Q. Was there an odor in the water?

MR. JEFFRIES: Objected to as leading.

A. Yes, sir.

Q. How about foreign substances in the water; was there anything growing or floating in the water?

A. Well, yes, it was very green sometimes in places where the wind didn't blow it away and I have made the remark several times, if it was not for stamboats running up and down this river, people couldn't live on it. Steamboats agitating the water naturally purified it a little, which was very bad indeed. And through the ice it would not do to drink the water at all. I have tried it and I know something about it.

Q. When the river was covered with ice and a hole was cut in, was there an odor from the water?

A. Yes, sir; as a general thing, yes; you could smell it.

Q. What was its effect upon the fish?

A. Well, I don't know; in some places I know there was a good many fish died, but we laid it to the Pekin and Peoria slop or something coming down there that killed them; I don't know what else it was.

5455 Q. Since the opening of the canal what has been the condition of the water?

A. It has been far superior to any water we have had since I have known the river; it has been better water, purer and sweeter. We don't get none of that bad smell now, that we used to have so bad; that is, not to me.

Q. Do you use the river water now yourself?

A. No, sir; I don't use it, no sir; it is a little too muddy of late. There is a lake and the Spoon river right across here sends out a great deal of mud and muddies the water here and I haven't tasted of it, no, sir.

Q. How far above here is Spoon river?

A. Oh, it is a mile perhaps, it comes in here perhaps up the river a quarter of a mile, where it comes in.

Q. Do you know of the existence of any typhoid fever among the people living on the river since the opening of the drainage canal?

A. No, sir; I don't know of any; I don't think there is any at all; there is a good many people living right on the river, and I know there is no typhoid fever.

Q. Before the opening of the drainage canal, what was the condition of the health of the community here with regard to fever and chills?

MR. JEFFRIES: Objected to as immaterial.

5456 A. Well, I will tell you; there was times that we had a good deal of fever and ague—chills, but that seemed to disappear. You don't hear of it now, but very seldom hear of it, a person having the chills here any more, than on the high ground—than on the hills on the high ground.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long has it been since you were on the river?

A. I am on it now; close by it.

Q. I know, but out on the water?

A. I am out on it a great deal; out in a boat a good many times.

Q. How many times?

A. Oh, I don't know, three or four, may be.

Q. How many times were you on it last summer?

A. Well, I can't tell you; I used to go out fishing occasionally, but I don't know how many times.

Q. Three or four times?

A. Perhaps so, I don't go on the river very much now any way. I used to be on the river on a steamboat.

Q. You haven't been on the river much lately, for the last several years?

A. No, I live here on the river bank; I lived in a cabin boat; I used to be in the water.

5457 Q. Now?

A. Yes, sir; but I am out of the water now; my boat drifted up where it is and I live up there.

Q. Are you a man of family?

A. No, sir.

Q. You "keep batch," do you?

A. Yes, sir.

Q. How long have you "kept batch?"

A. Well, I guess four or five years; that is off and on; part of the time I live at the hotel. If you are speaking about being on the river, I have been down to Beardstown several times and up to Peoria.

Q. The people here in town use well water, don't they?

A. Yes, sir; hydrant water mostly.

Q. Hydrant water, that comes from the city water system?

A. Yes, sir; but there is a few that use drive wells; they use drive wells here down on the bank.

Q. They don't use the water from the river?

A. No, not for drinking purposes as a general thing. Well, they never have very much, except when they get caught out fishing or something of that kind.

Q. When you say the water is better now than it was before the canal was opened, you mean that is so because there is more current and a larger volume of water now?

5458 A. It smells better; it hasn't got that bad offensive smell like it used to have. You would naturally suppose of course that it was the flow of water that remedies that.

Q. You don't know whether that filth is in there now or not?

A. Well, I don't know, sir; I know the water is a little better, that's all I know.

Q. You don't know what it contains?

A. No, sir. No, I don't know that; I know that quick running water generally smells better, and I suppose that is the result of the drainage. We could notice a change for the better a week after the water came in here, as far as that goes.

Q. The current must be much stronger now than it was before the canal was opened?

A. Yes, sir.

Q. Very much stronger?

A. Well, it was a great deal of dead water at some places; it seemed to be no current at all. Low water; we had very low water then.

Q. You don't have that now; there is always a good current, isn't there?

A. There was pretty low water before the canal was turned in.

Q. What I mean, there is no time of the year now that you have dead water?

A. No.

5459 Q. There is always a current?

A. There is always a current.

GEO. W. BUNKER.

5460 Havana, Illinois, July 21, 1903.

C. M. MORRILL, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. C. M. Morrill.

Q. Where do you live?

A. Havana, Ill.

Q. How long have you lived here?

A. It will be ten years in January, next January.

Q. What is your business?

A. Physician and surgeon.

Q. Doctor, are you acquainted with the Illinois river at this point?

A. Yes, sir, quite well.

Q. How extensive has your acquaintance been with the river?

A. Oh, I used to boat a great deal and had considerable interest in the river. I have been around it here considerably; I haven't boated here much, but I did before I came here.

Q. Where did you boat before you came here?

A. On Rock river.

5461 Q. Have you been on the Illinois river since you have been here?

A. Yes, sir. I have been on excursions considerable, and I have been on launches.

Q. Have you observed the Illinois river before the opening of the drainage canal?

A. Yes, sir.

Q. Describe the condition of the Illinois river at this point before the drainage canal was opened?

A. Why, the first two or three years I was here, we had very low water; had no high water; it was a filthy bank all along, as the waters would recede, along in the summer time, and very little current. Scum and filth all along the banks, a good deal of odor from it so you could smell it clear up town sometimes.

Q. Did you observe anything floating down the river?

A. Yes, there used to be, I don't know what it is called—

cakes of filth that came down from Peoria; there was one at the bridge that they had to dynamite out.

Q. What were these cakes composed of?

A. They said they came from the distilleries.

Q. What were they composed of?

A. Well, I couldn't tell you; I didn't examine closely.

Q. Did you see them?

5462 A. I just saw them from the bank, you know; I didn't go on them. There was a large island came here and lodged at the bridge one time and they tried to blow it out.

Q. Did you ever notice any green scum on the water before the opening of the caial?

A. Yes, sir; it was here every summer; it was here at the Chautauqua grounds so they couldn't land hardly, for it, and had to build a floating wharf out in the river before they could land. There was so much filth there and the river was so low.

Q. Have you observed the river since the opening of the canal?

A. Yes, sir.

Q. What in your opinion has been the effect upon the waters at Havana of the opening of the drainage canal?

A. It has made more current; it hasn't been so low during the summer. The water looks purer and cleaner, and the banks have been much better and there is no stench as there was before.

Q. In times of sudden freshets, before the opening of the drainage canal, what would be the effect upon the river at this point?

A. Oh, it would be cleaned out and there was less
5463 malaria in those seasons when we had high water, and less typho-malaria. We have had very little since there has been high water here. The first two or three years the whole town was full of malaria, and all around here.

MR. JEFFRIES: I move to strike out the answer for the reason that it is incompetent and immaterial and does not prove or tend to prove any issue involved in this case.

Q. Since the opening of the drainage canal in 1900, has there been any typhoid fever in the city of Havana?

A. I haven't seen any, real typhoid.

Q. Have you known of anybody dying of typhoid fever here?

A. Not with typhoid, no, sir.

Q. How large a town is Havana?

A. I don't know what they claim, 3500 or something like that.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Was there any typhoid fever before the canal was opened?

A. Why, there was some.

Q. Have there not been some cases since?

A. I haven't seen any, sir; I don't know that there hasn't been any. I have never seen any cases here since.

5464 Q. The water in the Illinois river is not used by the people of this town for domestic and drinking purposes—the town of Havana, is it?

A. Only by the fisherman, I guess; I don't know.

Q. Doctor, have you any personal knowledge of their using it?

A. Why, they tell me they use it; I have seen them drink it; I have seen the boatmen drink it.

Q. When they were out upon the river?

A. Yes, sir; I went up with John Shelte, on his launch; he drank it on the river. They drink it right along out of the river in a cup, or he had a goblet or a beer-glass.

Q. You don't consider this water good water, do you, for domestic purposes, the river water?

A. I don't consider any river water good for domestic purposes, where cities drain in it, unless they get it from the bottom of the river, and I don't know whether it would be then or not. I wouldn't drink any river water; I have, though. I wouldn't unless I had to.

Q. You say you are not an authority on that subject?

A. No, sir.

Q. Then I take it from the statement that you wouldn't drink it unless you had to that you wouldn't recommend this water?

5465 A. No, sir, not for drinking purposes. I have drank it on these excursion boats when they had ice in it. I wouldn't be particularly afraid of it, but I would rather have better water.

Q. What school of medicine do you belong to?

A. Belong to the regular school.

Q. How long have you been practicing?

A. Thirty odd years.

C. M. MORRILL.

5466 Havana, Illinois, July 21, 1903.

L. A. EVERIST, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. L. A. Everist.

Q. Where do you live?

A. Havana.

Q. How long have you lived here?

A. I have lived here all my life, thirty years.

Q. What is your business.

A. Fishing.

Q. How long have been fishing?

A. Never done anything else.

Q. Commenced to fish right after you were born?

A. No, sir. I fished when about fifteen or eighteen years, possibly.

Q. What was the condition of the Illinois river at this point before the opening of the drainage canal?

A. In regard to the stage of waters or—

Q. Everything.

5467 A. Well, the water got very low during this season of the year and the water got very filthy.

Q. How did the filth manifest itself?

A. Well, during the cool season, during the season that the water was cold, it seemed to be more filthy, there was more of that stuff running.

Q. Was there any odor to the water?

A. Yes, sir; during the season when it would be froze up it would smell bad.

Q. In what way?

A. Well, it would smell bad and be filthy so it couldn't be drank or anything.

Q. During the summer in low stages, was there any scum on the water?

A. Yes, sir.

Q. Describe it?

A. A green scum.

Q. What effect would the water have on fish in the winter time?

A. Well, it would kill them if I didn't get in the spring water; the fish on the river would die after it had been froze up for some time.

Q. Did you ever see any fish taken from under the ice?

A. Yes, sir.

5468 Q. Just describe it?

A. Well, after it would be frozen up for some time, the fish would have to go into the spring water or they would die; they would die and float down the river, and get weak—they would swim along the edge of the river and people would pull them out with gigs or forks or something; they would be so weak that they couldn't get out of the way. I have seen them condemned so they wouldn't take them when it would be frozen up at all; all fish around this point.

Q. At what markets would they be condemned?

A. St. Louis and in the east, at New York.

Q. Did you ever fish through the ice here?

A. Yes, sir.

Q. What would be the effect upon cutting a hole in the ice before the opening of the drainage canal?

A. Well, there would be an awful smell and the water would be very filthy.

Q. Did you ever see what is known as Peoria Islands floating down the river?

A. Yes, sir.

Q. What are those islands composed of?

A. Manure.

Q. When and where did you see them?

5469 A. During the flows of the Illinois river and I have seen them all the way from this place to Peoria.

Q. How large would those islands be?

A. Well, they would vary in size all the way from two or three feet to fifty feet, I suppose, square; possibly larger.

Q. Did you ever see any of them here at Havana?

A. Yes, sir.

Q. Where?

A. I saw a large one lodged against the bridge here that I know was blasted loose; and I saw them along the islands and along the shores on both sides of the river.

Q. Since the opening of the canal, what has been the effect upon your nets?

A. Well, since the opening of the canal—in regard to lasting better or—

Q. Yes?

A. Well, we can fish through the summer time and they last better than before. The water is more cool.

Q. How about in the winter time?

A. Well, in the winter time that stuff collects on them just the same.

Q. What stuff do you mean?

A. Why, slime; it is caused from the stills at Pekin and the glucose factory, I suppose.

5470 Q. What is the nature of that slime?

A. Why, it is a slimy substance and will stick to anything it touches; it flows in small pieces, but it collects in large quantities on anything it happens to touch.

Q. Has it a name among the fishermen?

A. Yes, sir; we call it slur-gut among the fishermen.

Q. And did you have that accumulation before the opening of the canal?

A. Yes, sir.

Q. As much as you have it now in winter?

A. Yes, sir.

Q. How are the nets cleaned from the effects of this slur-gut, as you call it?

A. Why, they are shaken and taken out on the bank and whipped with sticks.

Q. What is the color of it?

A. It is a kind of a light color,—white.

Q. How far up the river do you fish and have you fished?

A. Why, I never fished much above Kingston—between here and Kingston is my principal fishing territory.

Q. Do you find this substance on your nets up that far?

A. Yes, sir.

Q. Do you have it on the nets in summer as well as winter?

A. No, sir; not at this point.

5471 Q. Do you have it now in winter in the same quantity as you did before the opening of the drainage canal, or in greater quantity?

MR. JEFFRIES: Objected to as leading.

A. Well, I don't know as there is much difference to speak of.

Q. What in your judgment, has been the effect of the opening of the drainage canal on the water of the Illinois river at this point?

A. Well, it has been higher; the water has been cooler, purer,—I couldn't see why it wouldn't be more pure.

Q. Have any smell to it?

A. Not so much.

Q. The water still has a smell at low stages, has it?

A. During the time that it is frozen up if it is frozen very much it will have a smell; but since the canal was turned in, there is more current and it doesn't freeze so much; don't stay frozen so long.

Q. Have you been up the river from here to Peoria since the opening of the canal?

A. Yes, sir.

Q. How does the water compare as you go towards Peoria?

A. In regard to that there filth?

Q. Yes?

5472 A. In the fall of the year, as the water begins to get cooler, it begins to flow and it is stronger and there is more of it near Peoria than there is near this point.

Q. This slur-gut that you speak of, does it appear more in winter time than in summer?

A. Yes, sir; it can scarcely be noticed in summer.

Q. Have you found a reason for that ?

A. Well, I couldn't say as to that positively; I think it is possibly because the water is warmer and it don't have a tendency to float; it don't have a tendency to float in the warm weather as it would in the cold.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Do you live in a house-boat on the river?

A. No, sir.

Q. Live in a residence?

A. Yes, sir.

Q. Man of family?

A. No, sir.

Q. Do you live at home with your parents?

A. Yes, sir.

Q. You use water from the city water system, do you, for domestic purposes at home?

A. No, sir, we have a well.

5473 Q. Is it a driven well?

A. No, sir, it is an open well.

Q. Living well, then?

A. Yes, sir.

Q. What time of the year do these Peoria islands come down the river?

A. During the spring season.

Q. Are they frozen?

A. At times they are, yes, sir.

Q. Did you see them coming since the canal was opened?

A. Yes, sir.

Q. They come much more rapidly than they did before the opening of the canal, don't they?

A. Yes, sir, they travel a little faster, I guess.

Q. Don't you know that they do?

A. Yes, sir.

Q. Do you know whether any of them come from Chicago or not?

A. No, sir, I couldn't say.

Q. Do you use the water of the Illinois river for domestic purposes?

A. Why, I drink it when I am fishing in the spring.

Q. You don't drink it when you can get anything else to drink, though?

A. No, sir.

5474 Q. What is the difference between the current of the river now and what it was before the canal was opened?

A. We have more current in low water than we did before.

Q. Stronger current?

A. Yes, sir.

Q. Do you notice the oily scum on the river now?

A. Well, slightly; very slight.

Q. Kind of a greasy appearance?

A. It is a mossy appearance.

Q. Do you know that these Peoria Islands come from Peoria?

A. Not positively; I always heard so.

Q. What fish thrive best in this river; what kind of fish?

A. Why, they seem to all thrive.

Q. Which thrives best?

A. I couldn't see much difference; the fish are all thriving well; the carp does the most well.

Q. Isn't the carp the most plentiful at the present time?

A. Yes, sir.

Q. Do you know what the carp feed on?

A. Not altogether, no, sir.

Q. They will feed on most anything, won't they?

A. Yes, sir.

Q. You say this slime and material that accumulates, does it accumulate on your nets in the winter time?

5475 A. Yes, sir.

Q. Did it accumulate on your nets in the summer time before the canal was opened?

A. No, sir.

Q. It accumulated just about as much afterwards as it did before?

A. Just about the same.

L. A. EVERIST.

5476 Havana, Illinois, July 21, 1903.

SAMUEL F. KYLE, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Samuel F. Kyle; residence, Havana, Macon county, Illinois; occupation, ice business.

Q. How long have you been in the ice business here?

A. About nine or ten years.

Q. Did you take samples of water at this point for the state of Illinois?

A. I did for Mr. J. H. Long, for the state; Prof. J. H. Long of the Northwestern University at Chicago.

Q. During what time did you take the samples?

A. Well, I couldn't give you—the dates are there; I have forgotten; I couldn't give you the dates now without referring to the cards. I took them on the dates ordered by Prof. Long.

Q. Did you receive instructions from Prof. Long as to how to take the samples?

A. I did personally; Prof. Long came here personally and instructed me how to take the samples.

Q. Were there also printed instructions as to the manner in which they should be taken?

5477 A. Yes, sir; on the back of the card.

Q. From what point did you take samples?

A. From the Illinois river above the mouth of the Spoon river and from the Spoon river beyond the influence of the Illinois water.

Q. In what kind of vessels did you take them?

A. In bottles; one bottle I presume—they were a glass bottle with the cork fixed tightly with a rubber seal over it, and a rubber band around it. One bottle I presume would hold a gallon; the other bottle would hold a half pint.

Q. Did you always pursue the same method in taking the samples?

A. I did.

Q. From whom did you receive the bottles?

A. From the express company here, for Mr. Long of Chicago; the American Express Company, I think it was.

Q. Describe the manner in which you took each sample in each bottle?

A. By immersing the bottle about a foot below the surface of the water—that is the small bottle—uncorking it in the water and as the bubbles would come up—of course when the bubbles ceased, I would close it; I knew it was full at that time; seal it with that glass stopper and bring up the rubber close around

it and tie the rubber band around the mouth of the
5478 bottle; that was the smaller bottle and the larger bottle
was done much in the same manner.

Q. How did you seal or cover the larger bottle?

A. It had a glass cork with a rubber cover and a rubber around it; it was just a light rubber that went over the cork and down from the mouth of the bottle so as to prevent the external atmosphere from having any influence on it.

Q. After the bottles were filled and tied up, what did you do with the smaller bottle?

A. Put it in a small can, and that can into a larger one; the small can I suppose was about the size of a quart; the larger one would hold a galon I suppose or two gallons; and it was packed in ice, and a material—I have forgotten the name of the material; it was a wood cutting—

Q. Excelsior.

A. Excelsior, it was covered with excelsior and ice placed around it; outside of the larger can and inside the smaller one, the ice was.

Q. After they were packed in ice what did you do with them?

A. We had a box, I suppose was about six inches by fourteen inches; there was a partition between—wooden partition. This bottle was in one side and the large can in the other packed
with excelsior also, and on top of the excelsior I placed a
5479 little piece of ice also, inside, and carried them to the ex-
press office and shipped them as soon as possible.

Q. At what time in the day did you take the samples?

A. In the morning, about five o'clock in the morning.

Q. From the time the samples were taken, until they were placed in the express office, how long?

A. From a half an hour to an hour, I presume.

Q. Did you have any regular time for taking the samples?

A. I would get these orders from Dr. Long, perhaps an order for four different samples and I would always follow his instructions; they would come a week apart, perhaps two weeks apart, sometimes one week apart, and then perhaps there would be several weeks of an interim, then another order for so many different samples again.

Q. Did you use any cards upon which you wrote the time and place of taking samples?

A. I did.

Q. When you took the samples, did you place upon the card the date when it was taken, the temperature of the water, the temperature of the air and the place of collection?

A. Yes, sir.

Q. When you had so prepared the card what did you do with it?

A. Tied it around the neck of the bottle; attached to the bottle, in the case that was shipped.

5480 Q. Did you place the card in an envelope and tie the envelope to the bottle?

A. Yes, sir; it was a little envelope; put it in the envelope and tied the envelope if I remember distinctly—it had Prof. Long's name printed on it and his address.

Q. I now hand you an envelope on which is written in ink "Geo. A. Wiggin, M. D., Milan, Ill.," and in lead pencil the letters "J. H. L.," and ask you to state whether that envelope is similar to the ones in which you placed the cards?

A. Yes, sir, very much.

Q. Through the hole in the envelope you passed a string and tied it to the neck of the bottle?

A. To the neck of the bottle—to the rubber that was over the neck of the bottle.

Q. I now hand you thirteeen cards and ask you to examine them and state whether those are the cards which you used and put into the envelopes on samples taken from the Illinois river? Here is another card which makes it fourteen.

A. Yes, sir, these are the samples with my notations on them, required by Mr. Long.

Q. I will ask you to examine one numbered 76, and state whether or not you wrote that one?

A. That is not in my handwriting; I think perhaps I carried that to the express office; not having the cards on
5481 hand that morning, understand, that is my impression,
that this card is not in my handwriting, and I think the express agent just wrote that on there at my dictation.

Q. For you?

A. Yes, sir; that would be my impression; the rest of the cards I can say are all in my handwriting.

JUDGE JOHNS: I now hand the Commissioner the cards above referred to and ask him to mark them Exhibit No. 7 for the State of Illinois, to the testimony of S. F. Kyle, for identification.

Said cards are so marked by the Commissioner.

Q. I now hand you forty tickets or cards, and ask you to examine them and state whether or not the writing on them is yours and whether they are the cards which you enclosed in the envelopes and attached to samples collected by you in the Spoon river?

A. Thirty-eight of them are, sir, and I presume the other two are by the agent, as they seem to be in the same handwriting. This I know is my card, because my notations are on there in my handwriting. The other I think is by the agent; 38 of them are in my handwriting.

Q. Are the cards numbered 142 and 156 cards prepared by you or by some person for you?

A. They were prepared by some person for me to the
5482 best of my remembrance; they were prepared for me by
the express agent.

JUDGE JOHNS: I now hand the Commissioner the 40 above mentioned cards and ask him to mark them Exhibit for the State of Illinois No. 8 for identification, to the testimony of S. F. Kyle, Spoon river.

Said cards are so marked by the Commissioner.

Q. What do you say is the difference, if any, between the character of the ice taken at this point, before and after the opening of the drainage canal?

MR. JEFFRIES: We object to the question for the reason that it assumes that ice is cut here and for the further reason that it assumes that the witness knows.

A. Well, our ice that we have taken here, has been the same, because we have taken it out of the bay here, which is outside of the influence of the Illinois river, or out of these lakes, and I have noticed no perceptible difference. Took it out of Seid's Lake up here.

Q. As to the general character of the water and its general condition, before and after the opening of the drainage canal, what do you say?

A. Well, as far as I know the water is better than it was before, that is apparently to me; more current and less stagnation about it. But that's only observation. I have never
5483 made any study of it; but that would be my impression, because I never had noticed this question before the question was brought up; that would be my judgment.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You are a married man, are you?

A. Yes sir.

Q. You don't use the water of the Illinois river for domestic purposes?

A. No, we use hydrant or well water.

Q. Since the opening of the canal you have noticed the oily, greasy substance or coloring on the water, have you not?

A. No, not to my knowledge.

Q. Have you been on the water very much?

A. No, only at ice times; I am not a fisher or hunter, only occasionally at times; perhaps three or four times a year; only at these times you understand that I took these specimens of water; these samples, but I have been about the river on an island up here, but not in the water at all.

Q. How does the current of the Illinois river compare now with what it was prior to the opening of the Chicago drainage canal?

A. I think it is swifter now.

Q. Very much swifter now?

A. Quite a good deal.

5484 Q. You have now a good current at all seasons of the year?

A. Yes sir.

Q. Where is this lake located from which the ice is cut in the winter time?

A. This lake is called Cook Harbor and is located right west of the ice house at the Northwest portion of the city of Havana.

Q. How is that lake fed?

A. Fed by springs, and by the flow of water that comes down from Quiver Creek, it is called.

Q. What portion of the ice is cut from this lake?

A. All of it has been cut there with the exception of one year; one year we cut from the river; that was before the drainage was turned in and year before last we cut from Seid's Lake.

Q. Where is Seid's Lake?

A. About half a mile west and about a mile or mile and a quarter north of Havana.

Q. How far is Seid's lake from the river?

A. About 200 yards, and the mouth of it opens into the river.

Q. Seid's lake is also fed from springs, is it not?

A. No, Seid's lake is fed from Thompson lake, I think, and from the Illinois river; but I think it is fed from Thompson's lake.

5485 Q. Where is Thompson's Lake fed from?

A. It is fed from the river I think and from Thompson's river on the north.

Q. How deep is the water in these three lakes, from which the ice was cut in the winter time?

A. From six to ten feet I should judge.

Q. What did you say was the name of this first lake?

A. Cook's Harbor I think it is called.

Q. Since the opening of the canal, all of the ice has been cut from that lake?

A. From that and Seid's lake.

Q. Where did you say you took these samples from?

A. From the Illinois river above the mouth of Spoon river and from Spoon river.

Q. Where is Spoon river?

A. Spoon river flows into the Illinois river west of Havana.

Q. And above Havana?

A. Above a portion of it, not above the extreme northern line of Havana; above here, but the extreme northern line of Havana is above the mouth of the Spoon river.

Q. Is Spoon river on the opposite side of the Illinois river from Havana?

A. Yes sir.

Q. How large is Spoon river at its mouth?

5486 A. Oh I suppose 100 feet about; 75 to 100 feet about.

Q. Did you personally take each one of these samples?

A. I did.

Q. You have not been on the river much since the opening of the canal other than taking these samples and fishing, or hunting?

A. That's all, either fishing or hunting, once a month or so.

S. F. KYLE.

5487 Havana, Illinois, July 21, 1903.

JOHN McGARVEY,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. John McGarvey.

Q. Where do you live?

A. Havana.

Q. What is your business?

A. Fishing.

Q. How long have you been fishing on the Illinois river?

A. Twenty-six years.

Q. What part of the Illinois river have you fished in?

A. Oh, I have fished in La Salle and Peru and Henry and down as far as Beardstown.

Q. State what the condition of the Illinois river was before the opening of the drainage canal?

A. It was pretty poor; I don't think if the drainage canal hadn't been turned in here we would have had half of the fishing we have got now.

Q. How was the water of the Illinois river before the opening of the canal?

5488 A. Oh, it was dead; kind of rotten and smelled at low water.

Q. Was there any odor on the water?

A. What do you mean?

Q. Smell?

A. Yes there was at low water mark.

Q. How far up did that odor extend, from Havana?

A. Well, it didn't extend any further than from here to Peoria.

Q. Was there any scum on the water?

A. Not very much there wasn't, without it was right low.

Q. As you went from Havana towards Peoria, would the water get better or worse?

MR. JEFFRIES: Objected to as leading.

A. It got worse.

Q. Describe the condition of the water as you would go from Havana to Peoria?

A. Before we would get to Peoria and Pekin it would smell a little worse.

Q. What was the cause of it?

A. The distilleries.

Q. Where?

A. At Pekin and Peoria.

Q. After you passed Peoria, what is the condition of the water?

5489 A. It is better.

Q. How far above Peoria did that condition prevail, the water being better than below?

A. As far up as I ever was along it.

Q. And how far up is that?

A. Well I have been up as far as Ottawa, along the river; I have fished as far up as La Salle and Peru and down to Beardstown and La Grange locks.

Q. What was the condition of the water as you went from Peoria, to Beardstown?

A. Well I couldn't see any difference from here. In the winter season it was pretty near as bad along down there as it was here.

Q. Since the opening of the drainage canal, what has been its effect upon the waters of the Illinois river at this point?

A. I think it has been better.

Q. In what way better?

A. Why the water was more pure; purer than it was before; when the water was low it seemed to be dead like; now there is a current through it, and it is purer too.

Q. Is there any smell to the water?

A. Yes, if you cut a hole through the ice in the winter there is a smell to it.

5490 Q. That is, since the opening of the canal?

A. Well not as bad as it was before.

Q. But you have the smell now?

A. Yes sir, some, but not as bad as it was before that.

Q. In your experience as a fisherman, have you come across a substance known as slurgut.

MR. JEFFRIES: Objected to as leading.

A. Yes sir, I have.

Q. What is this substance so-called by fishermen?

A. Slurgut; that's all the name we ever heard for it; we thought it come from these distilleries above Peoria. There ain't none of it above Peoria.

Q. Is that the name that it is commonly called by fishermen?

A. Yes sir.

Q. Describe what it is and how it affects the nets?

A. Why take it in the fall when the water gets cool; it settles on the nets; it is stringy stuff and just closes up the meshes. You can't lift the net or see through it and nothing will work into the net at all. It is all that two men can do to just move the net out of the water to save their lives. After it is in there 24 hours.

Q. Did that substance appear before the opening of the drainage canal?

A. Yes sir.

5491 Q. And have you had it since?

A. Yes sir, every winter but I don't think it is quite so bad since we got the current in the river.

Q. Did you ever see that substance above Peoria?

A. No sir.

Q. Have you ever seen what are known as Peoria Islands floating down the river?

A. Yes sir, some pretty good sized ones too.

Q. How large?

A. Thirty or forty yards.

Q. In the spring season?

A. I have seen in the spring when the ice broke up; I never counted them—but I seen a good many float over on the island and the bend and around the edge of the river.

Q. Do you remember seeing one that lodged in the river against the bridge?

A. Yes sir.

Q. What are those islands composed of?

A. Well all that I seen was hay and manure.

Q. Do you know where they come from?

A. Not exactly; they all say they come from the still houses at Peoria and Pekin; I never seen them move out.

5492 Q. Did you ever see any above Peoria?

A. No sir.

CROSS-EXAMINATION.

By Mr. Jeffries.

Q. You never fished much above Peoria, did you?

A. Yes sir; I used to live up at Lacon and up to the upper dam.

Q. These Peoria Islands didn't come down in the summer time?

A. No I never seen one in the summer.

Q. Either before or after the opening of the canal?

A. Oh yes sir, they used to come through here in the spring.

Q. But I mean in the summer time?

A. No sir, I never seen them come down here in the summer time.

Q. What do you mean when you say the water is purer?

A. Well it ain't dead; there is a good current through here and it keeps all the trash and everything out.

Q. Where does all that trash go to?

A. Well, it goes down the river or else back, one of the two; I don't know where it goes to.

Q. You say the water smells some now since the opening of the canal?

A. Well if you cut a hole in the ice in the winter you can 5493 smell it a little.

Q. The current is much stronger now than it used to be?

A. Yes sir.

Q. What fish thrive best in these waters?

A. Pretty near every kind I guess. Thrive you mean?

Q. Yes?

A. I don't see no difference.

Q. Which is the most plentiful?

A. Carp.

Q. What do they feed on?

A. They feed on flags and roots and things.

Q. They feed on most anything, don't they?

A. Pretty near.

Q. You live here in town?

A. Yes sir.

Q. Married man?

A. Yes sir.

Q. Do you have a pump at your home?

A. I use from a hydrant.

Q. You don't use the river water?

A. No sir.

Q. You don't use the river water for domestic purposes?

A. Only when it is cold weather we drink it; when it is 5494 cold, in the fall and spring and winter.

Q. You drink it only when you are out on your trips fishing?

A. Yes sir.

Q. You don't drink it when you can get anything else to drink.

A. No sir.

his
JOHN (X) McGARVEY.
mark.

5495 Havana, Illinois, July 21, 1903.

ERNEST O. SPINK,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Ernest O. Spink.

Q. Where do you live?

A. My home is in Chandlerville.

Q. Mr. Spink did you ever take any water for the sanitary district?

A. I did.

Q. From what river did you take the samples?

A. Sangamon river.

Q. When did you take it?

A. Well I couldn't say accurately, but you could tell from the cards, I suppose.

Q. About from what time to what time?

A. It was about from February until October I believe.

Q. And how often did you take it?

A. Once a week.

Q. You got the bottles from where?

A. One came from Chicago and two from Champaign.
5496 I would say, two from Chicago and one from Champaign.

Q. The bottles had glass stoppers in them when they came?

A. Yes sir.

Q. Now when you got the bottles how did you fill them?

A. In the summer time I waded out; I had on long legged rubber boots; I waded out as far as I could and filled them, after keeping the stopper in the bottle until I had them submerged, and then opening the stopper and filling them in that way. In the winter I walked out on the ice and cut a hole in the ice, and filled them the same as I did in the summer by submerging them.

Q. What point on the Sangamon river did you take these samples?

A. It was about 100 yards below the wagon bridge,—well it was on what they call the Mason County road.

Q. At what town?

A. At Chandlerville; about a mile from Chandlerville.

Q. What sized bottles did you use?

A. The large one I should judge would hold about a gallon and the smaller one would hold from three to four ounces.

Q. After you collected the samples what did you do with them?

A. I sealed them there at the river and took them straight to the depot after packing them and shipped them from there.

5497 Q. To whom?

A. Now I don't remember who.

Q. To Prof. Palmer?

A. Prof. Palmer was one.

Q. At Urbana?

A. At Urbana.

Q. Prof. Jordan of the University of Chicago?

A. Prof. Jordan of the University of Chicago.

Q. And the Board of Health of the City of Chicago?

A. And the Board of Health of Chicago.

Q. After you had sealed the bottles, did you pack any of them in ice?

A. The smaller bottles I packed in ice and tin cans; the larger bottles I just packed with excelsior.

Q. Did you place a card on each bottle, identifying the sample?

A. I did.

Q. On the card did you place the number of the sample; the date of taking, the hour of taking from the Sangamon river, with your name, height of water, temperature of water; direction of wind, temperature of air, rain, with the instructions for the taking of the water written on the back?

A. I did.

5498 Q. I show you a card sample No. 1081 and ask you if that card is in your handwriting, and ask you if you placed a card similar to that on each sample that you took, and sent to the three parties heretofore mentioned?

A. I did.

MR. TODD: I will ask the Commissioner to have sample card No. 1081, marked Sanitary District of Chicago No 9 for identification.

Said card is so marked by the Commissioner.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Where did you say you took these samples?

A. Sangamon river.

Q. How far up the Sangamon river?

A. About 100 yards south of the Mason County wagon bridge.

Q. How far from the mouth of the Sangamon river?

A. I have forgotten.

Q. Approximately?

A. I think it is 18 miles from Browning to the mouth of the Sangamon river.

Q. Where did you take the samples to ship them?

A. At the express office and depot at Chandlerville.

5499 Q. How far is Chandlerville from the point where you took the samples?

A. About one mile.

Q. How long after the samples were taken until they were put on the express train?

A. Sometimes it would be a half an hour, and not over three hours.

Q. You took no other samples than those mentioned in your direct-examination?

A. I did not.

Q. And for which cards were attached to the samples at the time?

A. They were.

ERNEST O. SPINK.

5500 Havana, Illinois, July 21, 1903.

RICHARD L. ENGLAND,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. Richard L. England; residence, Havana, Illinois; my occupation is fisherman.

Q. How long have you been a fisherman?

A. Over thirty years.

Q. How long have you been living upon the Illinois river?

A. Over fifty years; I have lived in Havana over fifty years.

Q. Over what portion of the Illinois river have you fished?

A. Well I have fished say twenty miles above here and twenty miles below; about forty miles is the distance.

Q. Are you a fisherman who employs men?

A. Yes sir.

Q. Fish on a large scale?

A. Fish on a large scale.

Q. What was the condition of the Illinois river and its waters prior to the opening of the drainage canal in January, 1900?

5501 A. Well, in our early fishing here; we used to fish altogether with bait nets and seines, and the sediment or settling was so bad that we had to quit that kind of fishing; I don't hardly know how to explain that.

Q. Were there substances growing in the water?

A. No sir, it was substances floating here; the main body of it was corn, the appearance of it; it would fill the nets full that we had to crab it out with a windlass.

Q. Was there—

A. I was going to tell you; the appearance of that when the weather gets cold; there is something that would form on there like cotton; it would collect on the nets, and the meshes were all full like a blanket.

Q. What was the color of this substance?

A. The corn was its natural color, the parts of grains was its natural color and the substance that formed on it was gray.

Q. Was there a smell to the water?

A. When it was froze up; more smell when it was froze up than any other time; we would cut holes in the ice and could hardly stand it over the holes in the winter; we would raise the nets and the fish in the nets would be dead.

Q. Now since the opening of the drainage canal, what has been the condition of the water here?

A. Well, in my opinion it has been a good deal better;
5502 we went back to the same kind of fishing that we did then,
but we had to quit. We don't get near so much of that floating stuff that we did before. The current of course, makes it better too; more current makes the water pure.

Q. To what did you and do you now attribute this floating slime on the water?

A. Well it came from Pekin and Peoria; the sugar refineries, and the distilleries I think is what caused it. That is, from the looks of the sediment, that is the corn and stuff; it naturally came from there. It was not at that time above Peoria; they hadn't the same trouble with it because I was acquainted with all the fishermen there and they claimed that they weren't bothered with it above there.

Q. Are you or have you a considerable acquaintance with the people living upon the river in this vicinity?

A. Yes sir.

Q. What is their condition of health and especially with reference to typhoid fever?

A. Well, the fishermen as a general thing, you hardly ever see one of them or ever hear of one of them having it; I can't hardly mention one that ever had the typhoid fever.

Q. How long do fish live in live-boxes now as compared with the time before the opening of the canal?

A. Well, that is a pretty hard question to answer, but
5503 we have had fish now for a week in the boxes, and usually they would die here when that stuff would come in,
hot weather, in one night. You couldn't keep them at all. You couldn't keep them at all because before we had fish, if we had fish to amount to anything, we had to take them to the mouth of Spoon river and put them in there. We have done it several times.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. The current in the river is much stronger now than it was before the canal was opened?

A. Yes sir.

Q. You say you have fished up the river as far as twenty miles and down the river twenty miles from Havana?

A. About that distance, yes sir.

Q. What do you call this substance that forms on the nets?

A. Got no name for it. We don't know what it is. It is an every year occurrence.

Q. Don't you fishermen have some name for it?

A. A nickname; we call it slur-gut; that is all we have for it. You know of course that is not the proper name. In the heart of all that where it starts to fork, it sprangles out like that (indicating) like your fingers, and when you examine it, right in the center, there is a small bit of corn, probably as short as that (indicating). That is where it starts from 5504 just like hair grows out, and that will float.

Q. You get that substance now don't you, since the canal was opened?

A. Why, some of it last winter, but it is only just a short time. We get rid of it quickly if there is anything in the river. Just a little of it will come down.

Q. You have a well or a pump here in town—are you a man of family?

A. Yes sir.

Q. You don't use the water of the Illinois river for domestic purposes at your home?

A. No sir.

Q. You don't use it under any circumstances, even when you are out fishing, unless you get caught out and haven't anything else?

A. Well, we use it in the winter when the water is cold enough, we don't use any other water.

RICHARD L. ENGLAND.

5505 Havana, Illinois, July 21, 1903

GEORGE E. McHOSE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. George Ephriam McHose; Havana, Ill.

Q. How long have you lived in Havana?

A. I have lived here permanently since 1872.

Q. What is your business?

A. I run a boat livery here.

Q. If you occupy any official position, state what it is and how long you have occupied it?

A. Well, I am Mayor of the city at the present time; I think this is my seventh term.

Q. Were you familiar with the condition of the Illinois river at this point before the opening of the drainage canal?

A. Yes sir.

Q. State its condition at that time?

A. Well it was stagnant and dirty and everything else; dead fish.

Q. Did it have a bar odor?

A. Yes sir.

5506 Q. What was the condition of the river since the opening of the drainage canal?

A. Well the water is in a great deal better condition.

Q. Before the opening of the drainage canal was there a kind of a slime in the water?

MR. JEFFRIES: Objected to as leading.

A. Yes sir.

Q. Since the opening of the canal is that slime in the water?

MR. JEFFRIES: Objected to as leading.

A. Not so much so; there is some.

Q. Do you know of any typhoid fever in this vicinity since the opening of the drainage canal, among the people living on the river?

A. No sir.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Have you fished any lately?

A. Yes sir, with a hook and line.

Q. You never fished with anything else?

A. No sir.

Q. You are a man of family, are you?

A. Did have at one time. I have got one son living.

5507 Q. You don't use the water in the Illinois river for domestic purposes?

A. Nothing only for washing; don't use it for drinking.

Q. You use hydrant water for drinking, do you?

A. Yes sir, we have a cistern.

Q. The current in the river is much more swift than it was before the canal was opened?

A. Yes sir, and more water.

Q. You don't know whether it contains deleterious matter or not?

A. No sir; all I know about it is observation, the fish and turtles and stuff that used to die before the opening.

Q. Well, all that you know is by observation?

A. Yes sir.

Q. If they do die now they are carried away?

A. Well, we don't see them, they don't come around; they don't come to the shore if they do die.

GEO. E. McHOSE.

5508 Havana, Illinois, July 21, 1903.

PHILIP L. DIEFFENBACHER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Philip L. Dieffenbacher.

Q. What is your business?

A. Physician and surgeon.

Q. How long have you been practicing in Havana?

A. Since 1856, about 48 years.

Q. Been in this city all the time?

A. With the exception of three years in the army.

Q. You are acquainted with the river at Havana?

A. Yes sir.

Q. Do you know what the condition of the river was before the opening of the drainage canal?

A. Well before the opening of the drainage canal it got very low and since the dams were put in there is a great deal of deposits along the shore. In some places it extends out 100 feet from the shore.

Q. Was there any scum on the water at low tide?

A. Oh yes.

Q. Any odor?

A. Yes, well there would be a peculiar odor, I can't
5509 describe it.

Q. What in your judgment has been the effect of the opening of the drainage canal upon the Illinois river at this point.

A. It has improved the condition of the water.

Q. Before the opening of the drainage canal did the river have any effect in your judgment upon the public health of the people of Havana?

A. I think it did.

Q. In what way?

MR. JEFFRIES: Object to the question as incompetent, irrelevant and immaterial for the reason that the witness has not properly qualified himself to speak upon that subject and for the further reason it makes no difference what effect the river had on the health of the people of Havana, either prior to or subsequent to the opening of the Chicago drainage canal and for the further reason that the question is not confined to the sanitary condition of the water of the Illinois river when taken into the human system.

A. I think it caused malaria.

Q. Since the opening of the drainage canal has there been any typhoid fever in Havana?

MR. JEFFRIES: Object to the question for the reason
that Havana has a water system as shown by the evi-
5510 dence, and obtains its waters from deep wells and not
from the Illinois river, so that any typhoid fever that might have occurred at Havana, or the absence of its occurrence, cannot be attributed to the use of the Illinois river water.

A. No typical cases.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You have a splendid water system here, haven't you, doctor?

A. Yes sir.

Q. Where do they get their water?

A. We get it from drive wells; I think we have sixteen drive wells probably which render an abundant supply of water.

Q. Do you know the character of soil through which these wells are driven?

A. It is a sandy, gravelly nature, and some streaks of clay or strata of clay.

Q. The people here in Havana don't use the water for domestic purposes?

A. No sir.

Q. You have never made an analysis of the water, have you doctor?

5511 A. No sir.

Q. You don't recommend the water for drinking and domestic purposes?

A. The river water?

Q. Yes.

A. No sir; never has been fit to use.

Q. The current in the river is very much more rapid now than it was before the canal was opened?

A. Yes sir.

Q. Are you on the river much, doctor?

A. Not a great deal; go fishing, that's about all, once or twice a year.

Q. Did you ever notice this odor that arises from the water?

A. I have noticed, yes.

Q. Both before and since the opening of the canal?

A. It don't seem to me there has been very much lately; I don't think I have noticed it this summer at all.

Q. Did you last summer?

A. Well I can't recall to mind whether I did last summer.

PHILIP L. DIEFFENBACHER.

ADJOURNED until Wednesday, July 22nd 1903, at 8 A. M., at Pekin, Illinois.

Pekin, Illniois, July 22, 1903.

5512 8:00 A. M.

Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

C. G. HERGET,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. C. G. Herget; my ocupations are a good many, I will just give one of them; Pekin, Illinois; Manager of the Globe distillery.

Q. Where is the Globe Distillery with reference to the city of Pekin and the Illinois river?

Objected to as immaterial.

A. Located in Pekin, Illinois, about a mile from the court house, in Cincinnati township, about half a mile from the Illinois river.

Q. Is it above or below the city of Pekin, on the Illinois river?

A. Well it is above and still it is below certain parts; I think it is a little below. 5513

Q. What are you engaged in distilling?

Objected to as immaterial.

A. Distilling alcohol, spirits and whiskey, made from grain.

Q. What grain do you use principally?

A. Corn, ninety per cent.; about ninety per cent.

Q. What other grain?

A. Rye and malt. About ten per cent.

Q. Was the Globe Distillery in operation in the years 1900, 1901, 1902 and thus far in 1903?

MR. JEFFRIES: Objected to as immaterial.

A. Yes sir.

Q. In connection with the distillery were cattle fed from the refuse of the distillery?

A. Yes sir.

Q. How are the cattle fed, with reference to the city of Pekin, above or below, so far as the current of the river is concerned?

MR. JEFFRIES: Objected to as immaterial and irrelevant.

A. It would be a little below, but of course they are much higher than the river.

Q. On the river above the current or below on the current?

A. Oh, we are below the city.

5514 Q. After the operation of distillation is completed, if there is any residue, what is it?

A. Slop; it is called slop.

Q. How do you estimate the quantity of slop—by the gallon or by the bushel?

A. By the bushel.

Q. What becomes of the slop?

A. In a bushel of grain there are so many gallons of water; Uncle Sam takes 56 pounds to the bushel on all grains—wait a minute; now there are 45 gallons of water to the bushel mashed, so each thousand bushels of grain represents 45,000 gallons.

Q. Does this product after the distillation of the spirts constitute what you call the slop?

MR. JEFFRIES: Objected to as immaterial.

A. Yes sir.

Q. So that for each thousand bushels of grain used in distilling, there are substantially 45,000 gallons of beer?

MR. JEFFRIES: Objected to as immaterial and leading, and irrelevant.

A. Yes sir.

Q. This beer is then distilled?

MR. JEFFRIES: Objected to as leading and irrelevant.

A. Yes sir.

5515 Q. How much remains of this beer after the process of distillation, in the form of slop?

MR. JEFFRIES: Objected to for the same reasons.

A. In gallons, you want?

Q. Yes.

A. About 40,000 gallons.

Q. What becomes of this slop?

MR. JEFFRIES: Objected to as immaterial.

A. It is stored in tubs and from the tubs it is fed to the cattle through a trough. In connection therewith I guess you want me to say how often we feed it?

Q. Yes.

A. The slop is fed three times a day to the cattle, and divided equally, about three pecks to the steer per day; that is three pecks of slop.

Q. A peck contains about three gallons, doesn't it?

MR. JEFFRIES: Objected to as leading.

A. Well, more than that, isn't it; 45 gallons in the first place to the bushel; it would be 11 gallons to a feed.

Q. About 11 wine gallons to a feed?

A. Yes sir.

Q. Where are the cattle situated, and how are they fed?

MR. JEFFRIES: Objected to as irrelevant and incompetent and not tending to prove or disprove any issue in the case and as wholy foreign to any question under consideration.

5516 A. The barns are located about one-half mile from the river. The construction is entirely wood; with proper ventilation, and sewage connection. We allow three and a half feet to the steer and he has slop three times per day, roughness twice per day, salt twice a day and the barns are thoroughly cleaned with cold water twice per day. The construction of the barns—they are so built with high roofs, with plenty of ventilation for the health of the cattle; they are constructed so that they maintain the best sanitary conditions possible, under a large roof. We feed 4400 head of cattle under one roof.

MR. JEFFRIES: We move to strike out the answer because it is incompetent and irrelevant as before stated and because it is not responsive to the question.

Q. JUDGE JOHNS: What is the material which you call roughness which you feed?

MR. JEFFRIES: Objected to as immaterial and incompetent.

A. What we call roughness is hay; hay or straw or cotton seed hulls—is known as roughness.

Q. When the sheds are washed up, what becomes of the washings?

MR. JEFFRIES: The question is objected to for the reason that it is incompetent, irrelevant and immaterial, not proving any issue involved in the case, it being immaterial so far as the issues of this case are concerned, what the volume or extent of sewage matter or offal from cattle pens at Pekin, into the Illinois river, are, and that such deposits are not and cannot
5517 be under any circumstances a legal or equitable defense
or a justification of the right or privilege to Chicago or the Sanitary District of Chicago to make such deposits or deposits of any character whether sewage or otherwise, into the Chicago Drainage Canal and thence into the Illinois river. And for the further reason that Pekin is situated upon the natural watershed of the Illinois river, and the fact of discharging decomposing matter from distilleries or other sources from cities and places upon the natural watershed of the Illinois river does not and will not either in law or equity, entitle the City of Chicago and the Sanitary District thereof to deposit its sewage, filth and other deposits into a stream carrying said deposits into the Illinois river by means of an artificial canal or waterway, when said deposits naturally belong to and flow into, the basin of a watershed other than that of the Illinois and Mississippi rivers—and for the further reason that there is no evidence showing that the deposits into the Illinois river from the distilleries and cattle sheds of Pekin contain deleterious matter or matter injurious to the public health or to the health of those consuming the water and there is no evidence showing that such substance contains disease germs, or the bacilli of water-borne diseases.

It is hereby stipulated and agreed between counsel that the foregoing objection shall be considered as having been
5518 made to all the testimony as to deposits in the Illinois
river below the Bear trap dam and may be raised at any time in the argument of the case without renewing the objection at the time any witness may testify.

F. S. BRIGHT, Com'r.

Q. (Question read.)

A. They go into the Illinois river.

Q. When the sheds are washed, what matters from the cattle are washed out and flow into the Illinois river?

A. Well the urine and the manure.

Q. Are the cattle fed in stalls or boxes?

A. It is all open barn; 100 to a barn, 50 on each side.

Q. Through troughs?

A. Oh, through troughs, yes sir.

Q. Are the troughs also washed out?

A. Yes sir.

Q. Is the roughness fed in the troughs in which the stock is fed or is it fed in racks?

A. It is fed between the troughs in what are called the hay alleys.

Q. Is the hay alley at times cleaned out?

A. Daily. Twice per day.

Q. Is that done by washings with water, or by shovels and forks?

A. Done by scraper.

5519 Q. What becomes of the matter scraped out of the hay alley?

A. It goes into the sewer.

Q. Is it then carried into the Illinois river?

A. Yes sir.

Q. What kind of an appearance does this refuse from the cattle sheds form in the Illinois river?

A. It forms an island, composed principally of manure, hay straw and refuse.

Q. Are the cattle fed salt, and if so, how much and how often?

A. They are fed twice a day about a quarter of a pound to the steer.

Q. At each feeding?

A. No, per day.

Q. If any of the salt remains, what becomes of it?

A. It would be washed in the sewer.

Q. Stated in wine gallons, what do you estimate is the amount of stuff washed into the Illinois river consisting of remains of slop, urine and fecal discharges, per day, from each steer?

A. In wine gallons, well, there is from eight to ten gallons of urine per day; of course it depends upon whether it is a

steer or bull; you know, and I should judge half of that
5520 amount of manure for each steer, gets into the sewer.

Q. Making about fifteen wine gallons per day for each steer, washed into the sewer?

A. No; that is wrong; I was getting at the urine and manure at that time. It is pretty hard to get the manure in gallons; you might estimate it in pounds, you know.

Q. Now do you mean by that, that there is about eight to ten gallons of urinary discharge per steer per day, and that the fecal discharge would be about half that amount, about four to five gallons?

A. Yes sir.

Q How much water do you use in washing out the stables daily?

A. From five to eight tanks; it depends upon the number of cattle.

Q. Containing how much water?

A. They are 18 foot bottom, and eight foot stave, and eight feet high. Substantially 160,000 gallons per day. But that is on full capacity, you understand.

Q. When the island composed of the offal from the cattle sheds is formed, what becomes of it?

A. Well sir, as a rule when high water comes, we break it and let it float down the river and most of it lodges on farms on the low lands, deposits there and forms part of the farms.
Of course I don't say all of it, but a good part of it does,
5521 so far as my knowledge goes; so far as I know and so far
as I have seen.

Q. The island is cast adrift in the Illinois river and allowed to take is course?

A. Yes sir.

Q. Is this island cast loose more than once per year?

A. About once a year.

Q. Before it goes away is it covered or left exposed to the air?

A. Exposed to the air, uncovered.

Q. Were you feeding cattle continuously during the year 1900?

A. Yes sir.

Q. How many cattle did you feed during the year 1900, in round numbers?

A. About 5,000 head.

Q. For the entire year?

A. Yes sir. That is, that is the total amount fed; it is not 5,000 head each day for twelve months.

Q. As a general thing about how many cattle would be fed daily, in the year 1900?

A. Well in eight months, it will average 4200 head per day and the other four months, about 2300 head. 2300 head is what we call summer capacity.

Q. During what eight months did you feed in 1900 about
5522 4200 head?

A. From October 1st to June 1st; that's the winter months.

Q. And during what period in 1900 did you feed 2300 head?

A. From June 1st to October 1st, or September 30th.

Q. How many cattle did you feed in the year 1901?

A. Well the variations wouldn't be over four or five hundred head. You see our slop capacity is so much and we can't go beyond, so the variation is very small.

Q. Did you feed a larger number during the eight months and a smaller number during the four months?

A. We feed every year about the same as we fed in the year 1900; it may vary from 150 to 200 head.

Q. And in the same proportions as in 1900 as to number?

A. Yes sir.

Q. Are there any other refuse products of a distillery than those you have described?

A. Yes sir.

Q. What are they?

A. Hot water and cold water.

Q. Used for what purposes?

A. For cooking and in the boilers and for cooling purposes.

Q. Do these waters contain any foreign substances?

A. No sir; well I don't know, I haven't analyzed it, but I don't think they do.

5523 Q. Nor any organic matter?

A. No sir.

Q. From what source do you obtain the water used in the distilleries?

A. From drive wells and open wells; what we call second vein water.

Q. At what depth?

A. About eighty feet.

Q. In what kind of strata do you find this water, sand or—

A. Sand and gravel.

Q. Is the water used in washing the sheds obtained from these wells or from the river?

A. From the wells.

Q. How many tons of roughness do you estimate that you feed in a year?

A. We feed about eight pounds per day, per steer.

Q. How many distilleries have been in operation in Pekin during the years 1900, 1901, 1902 and thus far in 1903?

A. Two.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You say the water that you use in boiling and cooking and washing out the distillery is obtained from drive and open wells?

5524 A. Yes sir.

Q. Where do you get the water that is furnished the cattle that you keep on hand?

A. The same place. That is, you know we have tanks with over-flows.

Q. All of the overflow water from those tanks, goes into the cattle troughs?

A. Cattle tubs, or cattle tanks.

Q. So that you don't use the water from the river for any purpose?

A. No sir.

Q. How long has your company been in the distilling business here at Pekin?

A. The Globe Distillery has been in operation since 1893.

Q. Was it operated under any other name prior to that time?

A. Yes sir.

Q. What name?

A. Globe Distilling Company.

Q. How long was it operated as the Globe Distilling Company?

A. Up to July 1st, 1898.

Q. The plant was built in 1893?

A. Yes sir.

Q. And was not in operation prior to that time?

A. No sir.

5525 Q. It was built in 1893 by the Globe Distilling Company and operated by them?

A. Yes sir.

Q. From 1893, to 1898, under that name, Globe Distilling Company?

A. Yes sir.

Q. Then it was sold out to what Company?

A. Standard Distilling and Distributing Company.

Q. Where is the home office of the Standard Distilling and Distributing Company?

A. 27 William Street, New York City.

Q. Does the Standard Distillery and Distributing Company own any other plant in Pekin?

A. No sir.

Q. To what extent was the plant operated from 1893 to 1898? As to its capacity?

A. Well there was 4,000 bushels eight months in the year and 2,000 bushels the remaining four months.

Q. Per day?

A. Per day; yes; that is the winter and summer capacity.

Q. What was the extent of the cattle industry of the firm from 1893 to 1898?

A. You mean the number of head per day?

Q. Yes sir.

5526 A. Just the same as I stated a little while ago; it varies a little, you know.

Q. Then the capacity of the plant and the output of the plant both as to the distilling product and cattle has been about the same from the time the plant was built in 1893 to the present day?

A. Yes sir.

Q. Subject only to slight variation?

A. Yes sir.

Q. Is there any offal or products not used in the distillery that is thrown into the Illinois river aside from what is fed to the cattle?

A. Not to my knowledge.

Q. Describe the manner in which this hay and manure and urine finds its way into the Illinois river?

A. The offal such as urine and manure, and the unused roughness is scraped or washed into the sewer and then flows into the Illinois river, forming an island, and at high water—

Q. I don't care anything about that. Is the mouth of the sewer below the surface of the water at all times, or above it?

A. Above it, all the time, except it has touched the mouth of it; it is an open sewer.

Q. Then this material or product from the distilleries, forms in a heap at the mouth of the sewer?

5527 A. Yes sir.

Q. And while it lays there in the summer time it goes through what is known as the heating or sweat process does it not?

A. Well, I don't know.

Q. You have noticed the steam and sweat in the atmosphere rising from this heap of manure and product, at the mouth of the sewer, have you not?

A. No sir; it doesn't act like other manure; it is entirely different.

Q. Have you ever noticed it closely?

A. Well, I have, but I don't know exactly what months it was; what time.

Q. Do you feed anything except perfectly sound and healthy cattle?

A. That's all we feed.

Q. And you keep them in that condition?

A. Yes sir.

Q. What is the age of the cattle that you feed?

A. About three to four years old; some are older. The steers will average about four years.

Q. Do you use any chemicals of any kind in your distillery?

A. No sir.

5528 Q. All then that you use, and all that the cattle feed upon is the product of grain or hay of some kind, is it not?

A. Yes sir.

Q. Together with the pure water from the sand pumps or wells?

A. Yes sir.

Q. Now you spoke of open wells in your direct-examination; what do you mean by that term?

A. Well a well that is open instead of being a driven well with pipes; it is built open all the way down to the surface of the water and then we insert pipes below that.

Q. With reference to the water supply, is there any difference where the water comes from?

A. No, I think not; you mean the quality?

Q. I mean is it a living well or a cistern?

A. It is a living well.

Q. It gets its water from the sand?

A. Yes. beneath the sand and gravel.

Q. Then, so far as the source of the water is concerned, it is the same both as to the driven wells and the open wells?

A. Yes sir. Same thing.

Q. Pekin has a water system has it not?

A. Yes sir.

Q. Where does it get its supply?

A. From driven wells.

5529 Q. Does it use the water from the Illinois river?

A. No sir.

Q. From your knowledge, state whether the water from the Illinois river is used at Pekin for domestic or drinking purposes?

A. I really don't know.

Q. Do you know of anyone that does use it?

A. I do not.

Q. Are you acquainted with the flow of water in the Illinois river as it now is and as it was before the canal at Chicago was opened?

A. Very slightly.

Q. You have been on the river to some extent, have you not?

A. Oh, once in a while I have been on the river.

Q. The current in the river is much stronger now than it was before the canal was opened?

A. Well, I don't know; I paid no attention to that at all.

C. G. HERGET.

5530 Pekin, Illinois, July 22, 1903.

C. G. MUEHLMANN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. C. G. Muehlmann.

Q. Where do you live?

A. Pekin, Illinois.

Q. How long have you lived here?

A. Since April, 1900.

Q. What is your business?

A. Physician and surgeon.

Q. Where did you live before?

A. Chicago, Illinois.

Q. Do you hold any official position in Pekin?

A. I do.

Q. What position?

A. Health Commissioner.

Q. What is the source of the water supply of the city of Pekin?

A. Drive wells.

Q. Can you describe them?

5531 A. They are pipes driven into the ground about 150 feet, and from there piped over the city, and the water is piped into a tank; that is where they get their pressure from.

Q. What is the extent of the public sewers of the city?

A. The main sewer is four blocks long, and they have some sewers in four blocks of alleys that connect with the main sewer.

Q. Into what does the sewer empty?

A. Into the Illinois river.

Q. You were not acquainted with the Illinois river before January, 1900?

A. I was sir; I was born and raised here; lived here until 1886 and then went to Chicago.

Q. For what purpose, doctor?

A. In 1886 I went to Chicago and studied pharmacy and graduated in 1889 then clerked in a drug store on the West Side until 1890, and I came back to Pekin, stayed here about a year and a half; went back to Chicago and became proprietor of a drug store there, until 1897 I disposed of it and then studied medicine at the College of Physicians and Surgeons, and graduated April, 1900.

Q. During that time, doctor, were you in Pekin at intervals?

A. I was.

5532 Q. What was the condition of the Illinois river at Pekin before the opening of the drainage canal and what has been the effect upon the Illinois river of the opening of the drainage canal since January, 1900?

A. The water was more sluggish, and there was more green scum and filth on the surface of the water. The current wasn't as swift as it is now, and I think the opening of the canal or the water coming in from Lake Michigan has deepened the channel.

Q. How about the apearance of the water?

A. The water is clearer now than it was at that time.

Q. Did you ever notice the effect upon fish at low stages?

A. I did not.

Q. What has been the condition of typhoid fever in Pekin during the last three years?

MR. JEFFRIES: We object to the question as incompetent, irrelevant and immaterial because there is no evidence showing that the people of Pekin use the water of the Illinois river for domestic and drinking purposes and for the further reason that there has been evidence showing that they do not use it for such purposes and therefore such testimony would constitute no proof of the sanitary condition of the water of the Illinois river at Pekin or elsewhere, prior to or subsequent to the opening of the Chicago drainage canal.

5533 A. You wish the death statistics?

Q. Yes sir.

A. The deaths for 1900 were two; 1901, one; 1902, two; 1903 up to July 1st, one.

Q. Those are the statistics that were furnished by you to the representative of St. Louis who called here, Mr. Ungar?

A. I submitted these to him, yes sir.

Q. Do you know the history of the cases, and where they occurred?

A. I don't know the history of the cases, but they occurred here in the city.

Q. Do you know what part of the city?

A. No sir, I do not.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Can you give the number of deaths from typhoid fever for the years 1897, 1898 and 1899?

A. I can if I refer to my books.

Q. Have you examined them lately?

A. Not since Mr. Ungar was here from St. Louis.

Q. You examined them then?

A. I did.

5534 I gave Mr. Ungar the number of deaths; I think we ran back ten years; but the books were in very poor condition.

Q. You don't know whether you gave him a statement which could be relied upon as authentic prior to 1900?

A. No sir.

Q. Explain, doctor, the system of waterworks here at Pekin?

A. They are drive wells, driven about 150 feet; second vein water I believe is what they call it; sand and gravel; it is then pumped into a tank and from this tank the pressure takes the water all over the city.

Q. State whether or not there is any considerable number of private drive wells in town?

A. There are.

Q. Are there any cisterns?

A. There are.

Q. Any considerable number of them?

A. Most every one has one of their own; that is for rain water.

Q. What is the population of Pekin?

A. Between nine and ten thousand.

Q. The people living in Pekin do not use the water from the Illinois river for drinking and domestic purposes do they?

A. No sir, they do not.

Q. And have not used it so far as you can remember?

5535 A. I do not believe they ever used it.

Q. Have you made an examination, scientifically of the water in the Illinois river for the purpose of ascertaining its sanitary condition?

A. No sir, I have not.

Q. The water in the Illinois river as I understand you, is somewhat clearer now than it was before the canal was opened?

A. Yes sir.

Q. Docter, all clear water is not necessarily free from harmful effects, is it?

A. No sir.

Q. Is all cloudy water, or water of muddy appearance, necessarily disease laden?

A. No sir.

Q. And the current as I understood you, of the Illinois river, is much swifter since the opening of the canal that it was before the canal was opened?

A. I believe so.

Q. You are out on the river a good deal are you?

A. I am, a good deal, hunting and fishing.

Q. Would you recommend the water of the Illinois river for domestic and drinking purposes, in view of its sanitary condition? 5536

A. I would not recommend it for drinking purposes; I would recommend it for domestic purposes.

Q. For washing and cleaning of vegetables that are to be used on the table without cooking?

A. I don't believe that any water ought to be used without cooking.

Q. It wouldn't be necessary to cook the water that comes from these drive wells, would it?

A. For domestic purposes?

Q. For drinking purposes?

A. No sir.

Q. When you speak of any water, you had reference to river water?

A. Yes sir.

C. G. MUEHLMANN, M. D.

5537 Pekin, Illinois, July 22, 1903.

D. H. JANSEN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. D. H. Jansen.

Q. Where do you live?

A. Pekin, Illinois.

Q. What is your business?

A. I am city engineer and also in the brick and tile business; I manufacture brick and tile and am in the contracting business.

Q. Mr. Jansen, you collected water for the Sanitary District of Chicago in the years 1899 and 1900 to be sent to the University of Illinois—Prof. Palmer; Prof. Jordan of the University of Chicago and the Board of Health of the City of Chicago, from the Illinois river, did you not?

A. Yes sir.

Q. You also collected samples of water for the Illinois State Board of Health, to be sent to Prof. Long?

A. Yes sir.

Q. At what point in the Illinois river did you collect these samples?

A. Part of them were taken about a quarter of a mile below the distilleries at Pekin, and a part of them at Wesley City above the city. 5538

Q. Both for the Sanitary District and for the Illinois State Board of Health at those two points?

A. No, the samples for the Illinois State Board of Health were taken below Pekin.

Q. And for the Sanitary District at those two points?

A. At those two points.

Q. You received bottles with glass stoppers in them, sent to you from these different people by express, did you not?

A. Yes sir.

Q. After you received the bottles just state how you collected the samples?

A. I took the bottles in the cases just as they were sent to me to the boat, and went up or down the river and when I arrived at the point at which I wished to take the sample; I took the cloth off the tops of the bottles; then put the bottles in the water with the stoppers on; pulled the stopper off and filled the bottle with water and rinsed it thoroughly; then I would rinse the bottle; took that water out, put the bottle down in the water again as far as I could reach and when the bottle filled, then put the stopper on under the water; then took the bottle and put the cork on again, tied it on with a tag. Tied it on with a string with the tag attached; and the small bottle we always took enough ice along and placed the small bottles in ice, and then when I arrived at Pekin I would refill them with ice and pack them thoroughly with ice. 5539

Q. After you had the bottles collected and brought into Pekin, how did you prepare them for shipment?

A. I put the large bottle in the case and filled the outside with excelsior; the small bottle I filled up with small broken ice and in that ice we mixed a little excelsior as we found that it held better that way, then we wrote the tags according to directions and had the express wagon come down and take them to the station.

Q. And shiped them to the different parties whose names have been heretofore mentioned?

A. Yes sir.

Q. And on each sample collected for the Sanitary District, did you attach a card with the sample number, the date of collection, time of collection, place of collection, your name, height of water, temperature of water, direction of wind, temperature of air; rain—on the back of which were printed directions for taking and shipping samples of water for analysis; to each one of the samples which were collected and shipped to the different people?

A. Yes sir.

Q. For the Illinois State Board of Health for the samples of water colected and sent by you, did you attach a card 5540 upon which was written, The Illinois State Board of Health, examination of water; place of collection; date of collection; name of collector, temperature of water; temperature of air; upon the back of which was printed directions for collecting and shipping, to J. H. Long, 2421 Dearborn Street, Chicago, at the bottom of it?

A. Yes sir.

Q. I show you a card, sample No. 1514 and ask you if that is the kind of a card with proper filling in that was attached to all the samples sent to the University of Illinois, the University of Chicago and the Board of Health of Chicago?

A. Yes sir.

MR. TODD: I will ask the Commissioner to mark that card Sanitary District of Chicago Exhibit 10 for identification.

Said card received and so marked.

Q. I show you a card on which is written "Illinois State Board of Health" and marked in the upper left hand corner, 408 in lead pencil and ask you if that is a card similar to the one placed on the bottles and sent to Prof. Long?

A. Yes sir.

Q. Are those the cards placed on the bottles sent to Prof. Long?

(Handing witness papers.)

5541 A. They are in my handwriting, yes sir.

MR. TODD: I hand them to the Commissioner and ask him to enclose them in an envelope and mark them State of Illinois Exhibit No. 9, for identification, to the testimony of witness D. H. Jansen.

Said card received and so marked by the Commissioner.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You personally took these samples, did you?

A. Why I personally took some of them and some of them I didn't take.

Q. Who took them for you?

A. Jack Miller took some of them.

Q. You placed your name on all of the cards, or did he do it for you?

A. I placed by name on most of them, but there was a few he put my name on for me, it was all done under my direction for me.

Q. About what portion of the samples did he take for you?

A. Oh, I should say thirty or forty per cent. of them.

Q. Did you see him take them?

A. Take the samples?

Q. Yes.

A. No.

5542 Q. You don't know where he got them then?

A. Why he is a perfectly reliable man and I am pretty certain that he took them where I directed him to take them.

Q. Where did you direct him to take them?

A. A quarter of a mile below the distillery, and up at Wesles City.

Q. What place in the river, near the distillery did you take the samples?

A. Do you want me to designate the place?

Q. Yes.

A. Why it was in the center of the river.

Q. In the channel?

A. Yes in the channel.

Q. Above or below the distillery?

A. Below the distillery.

Q. Which distillery?

A. Well I would say a quarter of a mile below all of them.

Q. Now where did you take the other samples?

A. In the channel of the river at Wesley City.

Q. How far is that from Pekin and in what direction? About how far?

A. Oh, seven miles.

5543 Q. Above or below Pekin?

A. Above Pekin.

Q. You took them from the channel of the Illinois river?

A. Yes sir.

Q. How long after the samples were taken was it before they were shipped?

A. On an average of three hours.

D. H. JANSEN.

5544 Pekin, Illinois, July 22, 1903.

H. G. HERGET,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. H. G. Herget, age 41; manufacturer, Pekin, Illinois.

Q. Were you ever connected here with an establishment for the manufacture of beet sugar?

A. I was.

Q. When was the manufacture of beet sugar commenced in this town?

A. 1900 and 1901.

Q. How long did it continue?

A. Two years and about two months each year.

Q. In a general way, how much beet sugar did you manufacture during those two periods?

A. Several million pounds.

Q. In the process of manufacturing beet sugar, was there any refuse material?

A. Possibly beet pulp; it might be so considered.

5545 Q. What became of this beet pulp?

A. Some of was run through sewers into Dead Lake; some of it was fed to cattle.

Q. Where is Dead Lake?

A. On the southwestern limits of Pekin.

Q. How is it situated with reference to the Illinois river?

A. It is about 1500 feet east.

Q. Is it a bay or estuary of the Illinois river?

A. I hardly think so.

Q. Has it an outlet into the Illinois river?

A. It has.

Q. Do the flood waters of the Illinois go into the lake?

A. When the river is high the water backs into the lake.

Q. When the river is low do waters from the lake flow into the Illinois river?

A. Yes.

Q. In the process of manufacturing beet sugar, do you use any acids.

A. No sir; not to my recollection. I will correct that—a very small percentage of muriatic acid.

Q. Well, what per cent. with reference to what product?

A. It is very infinitesmal.

Q. In these two seasons, how much beet pulp in round numbers by tons did you deposit in Dead Lake?

5546 A. Deducting water, which would evaporate, possibly 6,000 tons.

MR. JEFFRIES: Is that each day?

A. No, total; I get at it in this way, there is a great per cent. of water in pulp; in fact it is nearly all water.

Q. JUDGE JOHNS: State what is the form and consistency of beet pulp?

A. The form of beet pulp as it comes from the diffusion batteries is similar to macaroni, but not hollow; the consistency is like hay; when it is dried it is like hay; it is fibrous.

Q. When it is deposited in Dead Lake is it a solid substance or is it in liquid form?

A. Well, it is more of a gelatinous nature.

Q. Is it composed of the fibers of beets and the water used in the manufacture of it?

A. It is that part of a beet from which the sugar and solids have been extracted.

Q. When floods come in the Illinois river, was this material washed out into the Illinois river?

A. Some of it.

Q. Do you discharge any sewage from the manufacture of sugar into Dead Lake?

A. Water.

5547 Q. Did the water contain any solid substances added to it in the process of making sugar?

A. *Only in infinitesmal quantities.*

Q. What are the substances?

A. Lime and other solids; not required in the manufacture of sugar.

Q. Well if it is not a trade secret, what were they?

A. I couldn't tell you.

Q. How much water did you use and pass through your sugar refinery or manufactory per day?

A. Possibly one million gallons.

Q. Was that also discharged into Dead Lake?

A. It was.

Q. And ran thence into the Illinois river?

MR. JEFFRIES: I object to the question because the witness has stated that the lake was not an estuary for the water of the river.

A. Such as was not evaporated by the sun.

Q. How is the solid matter deposited in Dead Lake, through a sewer?

A. Yes.

Q. Was the water also discharged through the same sewer?

A. It was.

Q. So that mixed with the solid matter during the two months of each year, there was also a million gallons of

5548 water a day?

A. I judge so.

Q. Was there from Dead Lake during the time the sugar was manufactured a stream flowing into the Ilinois river?

A. A very sluggish stream, on account of obstructions.

Q. In consequence of the discharge of this solid matter and a million gallons of water a day, did Dead Lake fill up, or did it empty itself through this stream?

A. It filled up very little, emptied itself partly into the stream, most of the water being taken by evaporation.

Q. By the stream was the solid matter carried out into the river?

MR. JEFFRIES: Objected to as leading.

A. I hardly think so. Excepting what little pulp was carried.

Q. Did the pulp then remain in the lake or did it finally get out into the river?

A. Some of it got into the river and some remained in the lake.

Q. After flood waters, as for instance now, how much of the pulp deposited by your sugar manufactory remains in Dead Lake?

A. Very little, because most of the pulp or a good part of it was dried by the sun.

Q. Well after it was dried by the sun, there was very little matter left, was there not?

A. Fibrous matter.

5549 Q. This fibrous matter, is it of vegetable origin or is it some chemical compound created by the process of manufacturing sugar?

A. I call it vegetable.

Q. After the close of the factory as a beat sugar concern, into what was it converted?

A. Into a glucose factory.

Q. How long has it been running as a glucose factory?

A. Since June, 1901.

Q. Are you connected with the manufacture of glucose here?

A. I am a director of the Corn Products Company.

Q. Have you charge of the manufacture of glucose for the Corn Products Company here?

A. I have not.

Q. State what is the refuse products of the manufacture of glucose here, and where it is deposited and whether it finally gets into the Illinois river?

A. In the modern manufacture of glucose as now practiced in Pekin there is no refuse; as all solids in the corn are recovered; so that all that was running to the lake was water; possibly 2,000,000 to 3,000,000 gallons each 24 hours.

Q. What is the color of that water when it is run into the lake?

A. Clear.

5550 Q. What acids or foreign substances of any kind does it contain?

A. Sulphuric acid.

Q. How much sulphuric acid per thousand gallons of water?

A. A nominal per cent.

Q. Well, one-half of one, or one, or one and a half or ten?

A. I should say it would be a very moderate fraction of one per cent.

Q. Did the water from the glucose factory run into the Illinois river from Dead Lake?

A. It did.

Q. When did the manufacture of glucose commence and when did it end here?

A. It commenced in June, 1901, and with some stoppages, it is still continuing.

Q. Is there any waste product in the manufacture of glucose whatever?

A. None.

Q. Is the process of manufacture of glucose at Pekin different somewhat from the process of manufacture at other places, as for instance at Peoria?

A. The same.

Q. Is there no discharge from a glucose factory of a whitish color, or yellowish color?

A. At times from the feed house, when filter cloths burst,
5551 or tear.

Q. What kind of a discharge is that; of what is it composed?

A. It is apt to consist of a very small per cent. of gluten.

Q. Mixed with water?

A. Yes sir.

Q. How frequently does that occur at Pekin and has it occurred?

A. Rarely.

Q. In the event it does occur what amount of fluid is discharged into Dead Lake and thence into the Illinois river?

A. Only such a small amount as would come through a very small rip in a filter cloth, and on such occasions the repairs are immediately made.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. When did you say you commenced the beet sugar manufacture?

A. In 1899.

Q. Was that a local concern, the local company?

A. Practically.

Q. When they ceased operations as beet sugar manufacturers, did the company sell out to some other company?

A. They did not.

5552 Q. Quit because it was unprofitable or did they quit to manufacture something else?

A. Quit because it was not practicable.

Q. And therefore not profitable, is that true?

A. Well I don't see that that has any bearing on the case, and I don't know whether I want to put that in the record.

Q. I want the question answered.

A. If you do, I will say that we quit because it was not profitable nor practicable.

Q. Now then after that time, were there any other factories of the same character and manufacturing the same product at Pekin or at any other point on the Illinois river that you know of?

A. None other.

Q. And there has been none other since?

A. No sir.

Q. You commenced the manufacture of glucose when?

A. In June, 1901.

Q. And have been manufacturing that product since with the exception of a few intermissions?

A. Yes sir.

Q. How many other glucose factories are there in Pekin?

A. None other.

Q. Do you know how many there are at Peoria?

5553 A. One.

Q. Do you know of any other glucose factory on the Illinois river other than the one at Peoria, and the one with which you are connected here at Pekin?

A. I do not.

Q. What products do they manufacture at your glucose factory?

A. Glucose, grape sugar, corn oil, feed, oil cake and starch.

Q. Now in the manufacture of these products from corn, is there any substance or material or solids from the corn wasted?

A. None.

Q. Do you use any other products than corn?

A. Sulphur and acid.

Q. In the operation of a glucose factory, has there been any improvement in the way of utilizing all the solids of the corn, from year to year?

A. There have been.

Q. In what way?

A. The evaporation of the steeping water.

Q. So that, if any solids escape in the ordinary way of reducing the solids to the desired product, those solids that escape are saved by a process of evaporation, is that true?

A. Yes, unless there should be a temporary leak of some kind.

Q. Now in the use of the sulphur and acids, I understood you to say there was no great amount used?

A. No sir.

5554 Q. A very small, infinitesmal percentage?

A. Yes sir.

Q. Does any of the acid or sulphur escape?

A. Sulphur that is in the water does.

Q. What percentage of the sulphur escapes?

A. A very small percentage.

Q. A very small percentage of the infinitesmal percentage used?

A. A very small percentage as compared with the amount of water.

Q. What percentage as compared with the amount of sulphur used?

A. I could not tell you.

Q. It is not very large?

A. No. Enough to be a good disinfectant, I know.

Q. It is not injurious in any way?

A. On the contrary.

Q. Now as to the acid, what percentage of that escapes?

A. I think none; it being used in conversion.

Q. So that since the company has been manufacturing corn products no refuse has passed from the factory into Dead Lake other than water?

5555 A. Yes, the solids lost in steeping, were carried into Dead Lake until some few months ago, since which time they are being evaporated.

Q. Under the modern process which you have heretofore referred to?

A. Yes.

Q. Where do you get the water that you use in your factory?

A. From the Illinois river for the boilers; pump it from the ground for manufacturing.

Q. You don't drink the waters?

A. Nor the Mississippi.

H. G. HERGET.

5556 Pekin, Illinois, July 22, 1903.

E. W. WILSON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. E. W. Wilson; I am president of the American Distilling Company, and also of the German American National Bank at Pekin. My residence is Pekin.

Q. What is the name of the distillery which you manage here?

A. The American Distilling Company.

Q. Where is it located with reference to Pekin and the Ilinois river?

A. It is about a mile and a half below the central portion of the city, within the city limits and on the bank of the Illinois river.

Q. What are the products of the distillery?

A. Spirits and alcohol generally.

Q. In the process of distillation here do you have a beer or a mash?

A. Yes sir.

Q. From what kind of grain is it made?

A. Corn principally and some malted barley and rye.

5557 Q. Before you commence to distill, do you have a product called beer?

A. Yes sir. The corn mash is put through a process of fermentation and while it is undergoing that process of fermentation it is called beer.

Q. After the distillation of this beer, and the alcohol is extracted, what is the remainder called?

A. Slop.

Q. In speaking of the quantities of slop, how do you estimate it, by the wine gallon or by the bushel?

A. By the bushel.

Q. What is the quantity which you call a bushel of slop?

A. About forty gallons of beer or mash is equivalent to a bushel of grain is the way we figure it.

Q. In the process of making the fermented beer, how much water do you add to a standard bushel of mashed grain?

A. About forty gallons.

Q. And that amount of the water together with the mashed grain in it is called a bushel?

A. Yes sir.

Q. After the alcohol is extracted, what do you do with the slop?

A. Feed it to cattle.

Q. Where are the cattle located?

5558 A. On the same premises, on the back of the river; in sheds on the distillery premises.

Q. When your distillery is running at full capacity, how many cattle do you feed from the refuse?

A. About 4,000.

Q. Describe particularly the manner of feeding the cattle the slop?

A. Well the cattle are tied in sheds to a trough in which the slop is run; the slop is directly in front of them and they feed from this trough.

Q. How many times a day do you feed the cattle slop?

A. Three times a day.

Q. What quantity do you feed them each time?

A. Oh, about a third of a bushel, or about twelve to fifteen gallons.

Q. If there is any refuse or remainder left from the slop what becomes of it?

A. Why it is run out onto the bank of the river.

Q. Do you feed the cattle any solid food?

A. Yes sir, we feed some hay and cotton-seed hulls; cotton-seed meal at times.

Q. How is that fed to them?

A. It is fed to them dry.

5559 Q. If there is any remainder from the dried food, what becomes of it?

A. Well, I think that is carted away in wagons generally; they use it for bedding the cars.

Q. When your cattle are standing in places tied, is bedding put under them at night?

A. No sir.

Q. How do you keep the sheds clean?

A. The men go in behind the cattle and scrape the excrement into a sewer and it is washed out by water.

Q. Where do the excrement and the water with which it is washed out go?

A. It goes out on the bank?

Q. Does it get into the river?

A. Well I suppose the water does, but most of the excrement would remain in the lowland on the banks of the river.

Q. How many times a day do you clean the sheds?

A. Twice a day.

Q. About how much water do you use in cleaning, in a day?

A. It would be impossible to answer that. It would be sufficient to wash this excrement out; I haven't any idea; probably 50,000 gallons.

Q. Give your best judgment as to the amount of water which you use in cleaning the sheds?

A. Well, I should say 100,000 gallons.

5560 Q. Each day?

A. Yes sir. Well it might be double that amount; I don't know as I could estimate it.

Q. Does the refuse below your distillery on the bank of the Illinois river form a mass of hay and manure?

MR. JEFFRIES: Objected to as leading.

A. Yes.

Q. Do you sometimes call that an island?

A. No.

Q. What becomes of the refuse in times of high water in the Illinois river?

A. Why, there is a large portion of it floats away.

Q. And down the Illinois river?

A. And down the Illinois river.

Q. Do you take any means to break it up and get it into the river when the current is high?

A. No, we never have.

Q. Does it wash away of itself under the influence of current?

A. Yes.

Q. During the years 1900, 1901, 1902 and thus far in 1903, what amount of time has the American Distillery been running?

A. All the time, continuously.

5561 Q. Have you all that time been feeding cattle with slop and hay?

A. Yes sir.

Q. And all that time been throwing the washings of the cattle sheds and manure onto the bank of the Illinois river?

MR. JEFFRIES: Objected to as leading.

A. Yes sir.

Q. What amount of discharge is there as a general thing from one animal fed in the distillery in 24 hours, urine and fecal discharges?

A. There is from 12 to 15 gallons of urine from each animal and from 40 to 50 pounds of excrement.

Q. Now has this urine and excrement been washed out during all these years onto the banks of the Illinois river?

MR. JEFFRIES: Objected to as leading.

A. Yes sir.

Q. If you feed these animals salt, state about how much per day?

A. About a barrel a day.

Q. For use in the distillery?

A. Yes sir.

Q. Do you know whether you feed them as much as a quarter of a pound each, per day?

5562 A. No, I don't think we do.

Q. How many cattle have been fed at the American Distillery in the manner you describe in each of the years, 1900, 1901, 1902 and thus far in 1903?

A. About 6,000 head each year.

Q. How many cattle are you feeding at one time?

A. About 4,000.

Q. Are there any other refuse materials from your distillery than slop?

A. No sir.

Q. Do you use water in the distillery which afterwards escapes into the river aside from that used for the slop and the washing of the stables?

A. Yes, we use some water for cleaning purposes in the distillery, and the water that is used in the boilers.

Q. Is the water used for cooling purposes—does that go into the river afterwards?

A. Yes sir.

Q. How much water is used daily for cooling purposes which afterwards gets into the river?

A. Oh, I should judge 500,000 or 600,000 gallons. A good deal of that water goes through the cattle pens for washing out the sheds, as I said.

5563 Q. How large a mass of stuff accumulates on the bank of the Illinois river at your distillery before it is carried away or washed away by the floods?

A. Well, that's a pretty hard question to answer; there seems to be rather a good current at the place where we dump this on the banks of the river; there was a low spot of land right where our cattle sheds stand and there was a large share of this excrement stayed right in that low land; it has been filled in and hasn't gone to the river at all.

Q. State in a general way, how many tons of solid matter are deposited by your distillery on the banks of the Illinois river, in a month, a day or a year?

A. Well there is about 200,000 pounds of excrement per day.

Q. Do you know a place here called Dead Lake?

A. Yes sir.

Q. Where is that with reference to your distillery?

A. East of our distillery.

Q. Is it a lake which empties its waters into the Illinois river?

MR. JEFFRIES: Objected to as leading.

A. Yes sir.

Q. What factories or institutions here in the city of Pekin discharge their refuse into Dead Lake?

A. The Illinois Sugar Refining Company; the glucose 5564 works.

Q. Is it overflowed by the Illinois river in times of high water?

A. Yes sir.

Q. In times of low water, what is the color of the water in Dead Lake?

A. It is very black.

Q. Does there an odor arise from it?

A. Yes, sir, at times.

Q. Do you know by what that is caused?

A. No, I do not positively. I have an idea.

Q. What is your opinion as to what causes it?

MR. JEFFRIES: We object to the witness giving any opinion on the subject for the reason he hasn't shown proper qualifications.

A. Why, I think it is caused by the steep waters and the action of the acids that they use on the water; but that is my opinion; I don't know.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long has this American Distilling Company been organized?

A. Since 1892.

Q. Is it the successor of some other company?

A. No, it is a new plant. Prior to that time we operated a
5565 plant just north of that which is now closed and dismantled.

Q. Was it operated under the same names as this one you are now operating under?

A. No, the name was the Hamburg Distilling Company.

Q. Were you connected with that company?

A. Yes sir.

Q. And held office?

A. Yes sir, I was president of that company; it is now dismantled.

Q. The American Company came into existence as the Hamburg Company went out of the business?

A. Yes sir, very shortly after.

Q. How long was the Hamburg Company operated? Approximately?

A. Well, about twenty years.

Q. What was the capacity of the Hamburg Company during that twenty years?

A. About 2,000 bushels per day.

Q. Did it feed cattle also?

A. Yes sir.

Q. What was its capacity for feeding cattle?

A. About 2,000 cattle per annum; well I will change that—about I should judge 3,000 per annum; 2,000 cattle at one time.

Q. Did it feed as much as 3,000 per annum during each
5566 year for the twenty years?

A. Yes sir, I should think that was a fair average.

Q. The home office of the American Distilling Company is here in Pekin, is it?

A. Yes sir.

Q. Is it an Illinois corporation?

A. Yes sir.

Q. Did the offal and manure and drainage from the Hamburg Company deposit in the same place, or practically the same place as that from the present company, the American?

A. Well it was deposited in the same manner, but hardly in the same place.

Q. In the Illinois river—on the banks of the Illinois river?

A. Yes sir, on the banks of the Illinois river.

Q. Is there any waste except the slop that you feed to cattle from the products that you consume in the distillation?

A. No sir.

Q. Do you use any chemicals of any kind?

A. No sir.

Q. Where do you get the water that you use in the distillery?
